SELECTED WATER RESOURCES ABSTRACTS

The Library of the
OCT 15 1974
University of Illinois
at Urbana-Champaign

VOLUME 7, NUMBER 17
SEPTEMBER 1, 1974

W74-08701 – W74-09250

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $45 (domestic), $56.25 (foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

LIBRARY OF THE UNIVERSITY OF ILLINOIS

VOLUME 7, NUMBER 17
SEPTEMBER 1, 1974

W74-08701 - W74-09250

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

HYDROGEOLOGY IS MORE THAN A CLASSICAL SCIENCE,
Wisconsin Univ., Madison. Water Resources Management Program.
D. Stephenson.
Ground Water, Vol 12, No 3, p 148-151, May-June 1974. 1 tab, 3 ref.

Descriptors: *Hydrogeology, *Education, Environment, Management, Planning, Social aspects, Colleges, Universities, Water resources.

Uses of land and water resources create conflicts between natural and human environments. These conflicts are generally not dicusssed as part of a classical approach to geologic education. The need to increase non-earth science training simultaneous with traditional training is discussed. The benefits to be gained will be welcomed by both students and their potential employers. An interdisciplinary, project-oriented course was developed at the University of Wisconsin (Madison Campus) which encompasses both theory and practice in application of hydrogeologic concepts. Case-history presentations are used to supplement basic studies in water-, soil-, rock-, and people-interrelationships--with emphasis on groundwater. (Knapp-USGS)

PARTIAL AREA HYDROLOGY AND ITS APPLICATION TO WATER RESOURCES,
Agricultural Research Service, University Park, Pa. Northeast Watershed Research Center.
E. T. Engman.
Water Resources Bulletin, Vol 10, No 3, p 512-521, June 1974. 4 fig, 22 ref.

Descriptors: *Rainfall-runoff relationships, *Hydrograph analysis, Urban hydrology, Land use, Storm runoff, Infiltration, Hydrogeology, Soil water, Model studies, Remote sensing, Water quality.
Identifiers: Partial area hydrology.

Using a concept known as partial area hydrology, watershed areas are separated into hydrologically active and passive subareas. The literature relating to the development of the partial area concept is reviewed briefly and the relationship of partial area hydrology to geology, soils, and micrometerology is illustrated. The potential application of partial area hydrology is discussed with respect to present hydrologic techniques, future hydrologic models, urban hydrology, water quality, and water management. Certain regions within a watershed contribute runoff to the storm hydrograph while other areas act as recharge or storage zones. Whether an area contributes to runoff or to the groundwater depends on its physical position with respect to the channel, its soil properties, and the storm characteristics. Soil maps and air photos offer the best tools for identifying and delineating the partial areas in a watershed. On air photos, dark tones indicating poor drainage and light tones indicating erosion could indicate contributing areas. Other forms of remote sensing offer a lot of potential for the future identification of partially contributing areas. The most promising of these is radar imagery. (Knapp-USGS)

2B. Precipitation

A NOTE ON THE REMARKABLY LOW RAINFALL OF THE SUDAN ZONE IN 1913,
Cambridge Univ. (England). Dept. of Geography.
A. T. Grove.
Savanna, Vol 2, No 2, p 133-138, December 1973. 2 fig, 23 ref.

Descriptors: *Isohyets, *Droughts, *Africa, *Climatic data, *Dry seasons, Rainfall, Livestock, Rivers, Lakes, Flood discharge, Water levels Regional analysis.
Identifiers: Sudan zone, Inter-tropical discontinuity, Nile River, Senegal, Ethiopia.

The Sudan zone is a latitudinal belt running across Africa from Senegal to Ethiopia having a mean annual rainfall ranging between 16 and 40 inches. A dry period occurs from October to April with most of the rain coming during the summer months. The years between the turn of the century and World War I were considerably drier than periods before or after and despite scanty rainfall records, 1913 appeared to be particularly dry year. During this year many areas received from 20 to 50 percent of their mean annual rainfall with ranges of 5 to 30 inches within the zone. From available data the concluded cause of the drought period was a shift of isohyets 150 km. or more to the south of their mean positions bringing about an influence of the desert climate. PREDICTION OF DEW POINT TEMPERATURE, SOLAR RADIATION AND WIND MOVEMENT DATA FOR SIMULATION AND OPERATIONS RESEARCH MODELS,
Hydrocomp, Inc., Palo Alto, Calif.
D. Franz.
Available from the National Technical Information Service as PB-232 987: $6.00 in paper copy, *1.45 in microfiche. Completion Report, April 1974. 53 p, 7 tab, 11 ref. OWRR C-3266(3736)(1).

Descriptors: *Dew point, *Solar radiation, *Wind speed, Meteorology, Humidity, Energy balance, Regression analysis, *Air temperature, Simulation analysis, Model studies, Operations research, United States, *Forecasting, Water temperature.

Predictive relationships for mean daily dew point temperature, daily total shortwave solar radiation, and daily wind movement using daily maximum and minimum air temperature as the predictor variable were derived for approximately 23 stations in the United States. A simple linear regression of dew point on minimum temperature proved to be best for the dew point prediction. The fit was best in the humid regions in the winter and poorest in the summer in the arid and semi-arid regions. Percent of possible solar radiation was regressed on the daily range in temperature for the solar radiation relationship. The fit obtained was poorer than the fit for dew point. The coefficient of correlation for the dew point relationships was most frequently in the range of 0.7 to 0.95 while for solar radiation the range was generally for 0.5 to 0.8. The standard error of estimate for dew point ranged from 2.0 to 10.0 degrees Fahrenheit with most values in a narrower range from 4.0 to 6.0 degrees. The standard error for solar radiation was most frequently in the range of 10 to 25 percent.

THE POSSIBILITIES OF THE IDENTIFICATION OF PRECIPITATION ZONES WITH MISZ (METEOROLOGICAL ARTIFICIAL EARTH SATELLITES),
A. G. Gorelik, V. V. Kalashnikov, and Yu. A. Frolov.
Available from NTIS, Springfield, Va. 22151, as AD-766 035 Price $3.00 printed copy; $1.45 microfiche. Air Force Foreign Technology Division Translation Report FTD-MT-24-699-73, August 1973. 14 p, 4 fig, 2 tab, 11 ref. (Translated from Trudy Tsentral'noy Aerologicheskoy Observatorii. Sputnikovaya Meteorologiya, No 103, p 31-41, 1972.).

Descriptors: *Remote sensing, *Satellites(Artificial), *Precipitation(Atmospheric), Solar radiation, Surveys, Synoptic analysis, Data collections.

Precipitation zones may be sensed from the earth and from meteorological artificial Earth satellites with the aid of passive radar equipment. Radio brightness contrasts of the different types of clouds are determined by the form of the underlying surface against the background of which radiometric measurements are conducted. For all wavelengths the contrasts are increased with an increase in the reflection coefficient of the underlying surface. (Knapp-USGS)

EFFECTS OF ICE FORMATION ON THE SALT REGIME OF A RESERVOIR (VLIYANIYE LEDOOBRAZOVANIYA NA SOLEVOY REZHIM VODOKHRANILISHCHA),
Vsesoyuznyi Nauchno-Issledovatel skii Institut Vodosnabzheniya, Kanalizatsii, Gidrotekhnicheskikh Sooruzhenii i Inzhenerno Gidrogeologii, Moscow (USSR).
V. A. Baranov, and I. A. Bystrov.
Vodnyye Resursy, No 4, p 188-192, 1973. 1 fig, 4 tab, 6 ref.

Descriptors: *Ice, *Reservoirs, *Water chemistry, *Salt balance, *Salts, Ions, Chemical precipitation, Water balance.
Identifiers: *Ukrains, *USSR(Donets Basin), Mineralization.

During ice formation, precipitation of salts from water of reservoirs in the Donets Basin in the Eastern Ukraine occurs in direct proportion to thickness of ice cover. For the Staro-Krymskoye Reservoir, the quantity of salts precipitated in 1958-65 during periods of complete ice cover was 2%-5% of their total content in the reservoir. To forecast dissolved-salts content of reservoir water, special laboratory experiments are needed to study precipitation of salts during formation of ice. (Josefson-USGS)

THE RELEASE OF WATER FROM FOREST SNOWPACKS DURING WINTER,
Forest Service (USDA), Ogden, Utah. Intermountain Forest and Range Experiment Station.
H. F. Haupt.
USDA Forest Service Research Paper INT-114, January 1972. 17 p, 7 fig, 4 tab, 9 ref.

Descriptors: *Snowpacks, *Canopy, *Lysimeter, *Throughfall, *Forests, Snowfall, Evaporation, Snowmelt, Water level recorders, Rainfall, Precipitation(Atmospheric), Ablation, Interception, Solar radiation, *Rocky Mountain Region, Topography, Water equivalent, Winter.

Data collected on releases of water in undisturbed forests and small openings on two slope aspects over a three-year period are analyzed. The problem of measuring the outflows from beneath a snowpack directly was solved by the designing of a snow lysimeter. Results of the study showed that mature forest cover and topographic exposure greatly influence the release of snow water to the soil mantle. More water is usually available to recharge the soil mantle in small openings than in forested areas. Through fall-drip from the forest canopy is the major contributor to water release in the forest, and is directly dependent on the interception and detention of snow in the canopy. The volume of outflow from snowpacks is greater beneath the canopy than from small openings. The main difference originates from the intercepted snow by the canopy which is converted to drip which in turn percolates through the snowpack. (Mastic-Arizona)
W74-08761

ICE THRUST ON SHORES OF NORTH GERMAN LAKES AND ITS EFFECT,
K. Laskar, and K. Strenzke.
Available from NTIS, Springfield, Va 22151 as AD-769 728, price $3.00 printed copy; $1.45 microfiche. Army Cold Regions Research and Engineering Laboratory Draft Translation 405, August 1973. 7 p, 7 fig. Translated from Natur und Volk (Nature and Man), No 71, p 63-70, 1941.

Descriptors: *Lakes, *Ice cover, *Iced lakes, *Beaches, Geomorphology, Beach erosion, Scour, Ice loads, Ice jams.
Identifiers: *Ice thrust, Ice pressure, *Germany(Ploner Lake).

Beach ridges may be formed by ice pressure as the result of temperature variations and subsequent volume changes of the ice cover, or by ice thrusting due to wind action. The latter type predominates in Germany. A specific minimum basin area is a prerequisite for large-scale thrust action. Several cases of ice thrust on the Ploner Lake (Germany) are described. The ice blocks pile up parallel over each other along the shore and push inland. (Knapp-USGS)
W74-09219

EVALUATION OF ERTS DATA FOR CERTAIN HYDROLOGICAL USES,
National Environmental Satellite Service, Hillcrest Heights, Md.
D. R. Wiesnet, D. F. McGinnis, and M. Matson.
Available from NTIS, Springfield, Va. 22151 as N73-29220 - Price $3.50 printed copy; $1.45 microfiche. Status and Technical Progress Report, July 1973. 6 fig, 3 tab, 7 ref.

Descriptors: *Ice, *Snow cover, *Mapping, *Remote sensing, Great Lakes, Aerial photography, Snowmelt, Ice cover, Iced lakes.
Identifiers: *ERTS.

Mapping of snow cover using ERTS-1 data was six times faster than usig U-2 photography. Ice conditions in the Great Lakes can readily be determined by ERTS-1. Ice features characteristic of thawing conditions such as rotten ice, lack of pressure ridges, brash belts and compacted ice edges can be identified. A great decrease in apparent reflectivity in band 7 as compared to band 4 also indicates melting conditions. Using sidelap from two successive ERTS-1 images of Lake Erie (February 17 and 18, 1973) a measure of ice movement was made, agreeing closely with the estimate from conventional methods. The same imagery permitted tentative identification of the following features: shuga, light and dark nilas, fast ice, icefoot, ice breccia, brash ice, fracturing, ridging, rafting, sastrugi, thaw holes, rotten ice, ice islands, dried ice puddles, humnocked ice, and leads. (Knapp-USGS)
W74-09230

2D. Evaporation and Transpiration

CONTROLLED ENVIRONMENT STUDIES OF THE EFFECTS OF VARIABLE ATMOSPHERIC WATER STRESS ON PHOTOSYNTHESIS, TRANSPIRATION, AND WATER STATUS OF ZEA MAYS L. AND OTHER SPECIES,
Commonwealth Scientific and Industrial Research Organization, Griffith (Australia). Div. of Irrigation Research.
H. D. Barrs.
In: Plant Response to Climatic Factors UNESCO, 1973, p 249-258, 6 fig, 1 tab, 24 ref.

Descriptors: *Photosynthesis, *Transpiration, *Greenhouses, *Moisture stress, *Corn(Field), Flow resistance, Flow rates, Leaves, Carbon dioxide, Relative humidity, Temperature, Stomata, Root systems, Rhizosphere.
Identifiers: Ohm's law, Water potential.

The movement of water through some selected plant species was investigated. This study contradicted the assumption that resistance to flow of water from the roots through the stems to evaporation sites in the leaves is constant, which is analogous to an Ohm's law type of relationship. Studies conducted on a maize plant showed that resistance declined progressively as the transpiration rate increased in response to a lowered relative humidity and a constant temperature. There was considerable variation in behavior among species and no overall pattern analogous to an Ohm's law relationship was exhibited. A feature common to all species studied was a decline in resistance to flow as flow rate increased, although the importance and extent varied among species. Also the net photosynthetic rate was not reduced as relative humidity was lowered for all species. (Mastic-Arizona)

MEASUREMENT OF EVAPOTRANSPIRATION IN THE PRESENCE OF ADVECTION, BY MEANS OF A MODIFIED ENERGY BALANCE PROCEDURE,
Commonwealth Scientific and Industrial Research Organization, Griffith (Australia). Div. of Irrigation Research.
A. R. G. Lang.
Agricultural Meteorology, Vol 12, p 75-81, 1973. 3 tab, 15 ref.

Descriptors: *Evapotranspiration, *Advection, *Energy equation, *Heat flow, *Energy gradients, Wind velocity, Temperature, Humidity, Height.
Identifiers: Bowen ratio, Energy balance, Horizontal gradients, Vertical gradients, Philip's theory.

Large errors in evapotranspiration measures can be caused by local advection. These errors can be

calculated by an energy balance equation solved in terms of the Bowen ratio measured at a single height above the surface. This analysis was consistent with previous data confirming that a single height for measuring horizontal gradients of temperature and humidity can be used to obtain reliable data on evapotranspiration. Reliable measurements of evapotranspiration in the presence of large advective fluxes can be made using energy balance methods at a height of about 1 meter according to the described procedures. Further research is necessary to determine the general usefulness of the procedures, particularly for estimating horizontal gradients using a single height for measurements. (Mastic-Arizona)
W74-08760

PLANT WATER STATUS IN RELATION TO CLOUDS,
Georgia Coastal Plain Experiment Station, Tifton.
J. R. Stansell, B. Klepper, V. D. Browning, and H. M. Taylor.
Agronomy Journal, Vol 65, No 4, p 677-678, July-August, 1973. 2 fig, 2 ref.

Descriptors: *Evapotranspiration, *Soil moisture, Plant tissues, Cloud cover, *Clouds.

Clouds can cause significant changes in plant water status in a short time. Therefore, care should be taken to sample different treatments under comparable radiation. (Skogerboe-Colorado State)

A SENSITIVITY AND ERROR ANALYSIS OF PROCEDURES USED FOR ESTIMATING EVAPORATION,
Maryland Univ., College Park. Dept. of Civil Engineering.
R. H. McCuen.
Water Resources Bulletin, Vol 10, No 3, p 486-497, June 1974. 3 tab, 11 ref.

Descriptors: *Evaporation, Mathematical studies, Equations, Meteorology, Variability, Heat transfer, Heat budget, Winds, Model studies.
Identifiers: *Error analysis, *Sensitivity analysis.

The structure of commonly used evaporation models, the effect of variation in meteorological factors on observed evaporation rates, and the effect of error in measurements of the meteorological factors were studied by sensitivity and error analyses. Error in evaporation estimates resulting from measurement error in meteorological factors in probably much less than 5% of the computed evaporation rate. The importance of the different meteorological factors varies in time and space. The sensitivity analysis indicates that the Fractional-Evaporation Equivalent method is structurally inadequate and the Weather Bureau model is more flexible than the Penman model. However, the Penman model provides more realistic estimates of the importance of the various meteorological factors. (Knapp-USGS)

DETERMINATION OF GEOMETRIC AND HYDRAULIC CHARACTERISTICS OF A STREAM CHANNEL BY SOLUTION OF INVERSE PROBLEMS FOR SAINT VENANT EQUATIONS (OPREDELENIYE GEOMETRICHESKIKH I GIDRAVLICHESKIKH KHARAKTERISTIK RECHNOGO RUSLA PUTEM RESHENIYA O BRATNYKH ZADACH DLYA URAVNENIY SEN-VENANA),
Gidrometeorologicheskii Nauchno-Issledovatelskii Tsentr, Leningrad(USSR).
V. I. Koren', and L. S. Kuchment.
Vodnyye Resursy, No 4, p 83-100, 1973. 6 fig, 2 tab, 15 ref.

Descriptors: *Hydraulics, *Channels, *Channel flow, *Channel morphology, Roughness(Hydraulic), Mannings equation, Discharge(Water), Floods, Water levels, Optimization.
Identifiers: *USSR, *Saint Venant equations.

Saint Venant equations are the most thoroughly studied model of unsteady channel flow and are widely used to calculate movement of flood waves and reservoir releases. Determining geometric and hydraulic characteristics of a stream channel is based on observations of the water regime. Solution of this problem is unstable, and additional information is needed on properties of the solution and on possible errors in initial data. Algorithms are proposed for solving the problem at varying amounts of initial data, using the theory of incorrect problems and optimization procedures. Algorithms proposed were tested on the basis of data of special observations conducted on the Svir' River in northeastern Leningrad Oblast and on the Tvertsa River in Kalinin Oblast. (Josefson-USGS)

SURFACE WATER TEMPERATURES AT SHORE STATIONS, UNITED STATES WEST COAST, 1972.
Scripps Institution of Oceanography, La Jolla, Calif.
Available from NTIS, Springfield, Va. 22151 as AD-768 375 Price $2.75 printed copy; $1.45 microfiche. Data Report (SIO Reference 73-15), May 1973. 20 p, 1 fig. ONR Contract N00014-69-A-0200-6006.

Descriptors: *Water temperature, *Salinity, *Sea water, *Pacific Ocean, Data collections, Hydrologic data, Oceanography, Sampling.

Temperature and salinity data observed during 1972 at shoreline stations along the west coast of North America from the Strait of Juan de Fuca, Washington, to La Jolla, California, are compiled. The data consist of monthly means, ranges, and standard deviations based on daily observations. Temperature readings and water samples are obtained from surf and sandy beaches, off rocky cliffs and ledges, over the sides of lightships, and off piers, depending upon the station location. (Knapp-USGS)
W74-09197

SMALL-STREAM FLOOD INVESTIGATIONS IN ALASKA, A COMPILATION OF PEAK DATA, MAY 1963 TO SEPTEMBER 1972,
Geological Survey, Anchorage, Alaska.
S. H. Jones.
Basic-data report, 1973. 55 p, 8 fig, 3 tab, 5 ref.

Descriptors: *Peak discharges, *Small watersheds, *Alaska, Stage-discharge relations, Floods, Stream gages, Data collections, Hydrologic data.

A small-stream flood investigation program for Alaska was initiated in September 1962. This program was designed to provide flood data on streams with drainage areas generally less than 100 square miles, placing particular emphasis on those with areas of less than 50 square miles. The objective was to obtain sufficient flood data to define the magnitude and frequency of floods on a regional basis for the entire State and provide information for detailed hydrologic studies. Hydrologic data obtained under this program consist primarily of the annual maximum instantaneous stages and discharges. (Knapp-USGS)

THE PINE-POPPLE RIVER BASIN--HYDROLOGY OF A WILD RIVER AREA, NORTHEASTERN WISCONSIN,
Geological Survey, Washington, D.C.
E. Oakes, S. J. Field, and L. P. Seeger.
Available from Sup Doc, GPO, Washington, D C 20402 - Price $3.20 (paper cover). Water Supply Paper 2006, 1973. 57 p, 16 fig, 2 plate, 7 tab, 26 ref.

Descriptors: *Wild rivers, *Wisconsin, Water resources, Water utilization, Recreation, Fishing, Boating, Water supply, Water quality, Data collections, Hydrologic data.
Identifiers: *Pine-Popple river basin(Wisc).

The Pine and Popple Rivers, virtually unaltered by man, flow through a semiprimitive area of forests, lakes, and glacial hills in Wisconsin. White-water streams, natural lakes, fish and animal life, and abundant vegetation contribute to the unique recreational and aesthetic characteristics of the area. The basin covers about 563 square miles in northeastern Wisconsin. Swamps and wetlands cover nearly 110 square miles, and the 70 lakes cover about 11 square miles. The undulating topography is formed by glacial deposits overlying an irregular, resistant surface of bedrock. An annual average of 30 inches of precipitation, highest from late spring to early autumn, falls on the basin. Of this amount, evapotranspiration, highest in mid summer and later summer, averages 19 inches; the

remaining 11 inches is runoff, which is highest in spring and early summer. Groundwater from the glacial drift is the source of water for the minor withdrawal use in the basin. The major uses of water are for recreation and power generation. No water is withdrawn from lakes or streams, and no sewage or industrial wastes are added to lakes or streams. Most of the flow of the Pine River is used for power generation. The main stems of the Pine and Popple Rivers contain 114 canoeable miles, of which 95% is without such major obstructions as falls or large rapids. In general, streams support cold-water fish, and lakes support warm-water fish. The basin has no significant water problems. (Knapp-USGS)

Vodnyye Resursy, No 4, p 113-123, 1973. 3 fig, 17 ref.

Descriptors: Groundwater, *Groundwater basins, *Artesian aquifers, *Estimating, *Mapping, Groundwater recharge, Groundwater movement, Base flow, Subsurface flow, Hydrogeology.
Identifiers: *USSR(Baltic Sea region), *Water exchange, Isolines.

The Baltic artesian basin, which covers about 214,000 sq km in the USSR, includes Estonia, Latvia, Lithuania, the Kaliningrad Oblast, and northern regions of Belorussia. The southwestern part of the basin is located in Poland. Possibilities of estimating and mapping rates of exchange of fresh groundwater were based on data on subsurface flow. Periods of water exchange within the Sventoji-Tartu aquifer complex range from 250 years to 10,000 years, depending upon specific natural conditions of the region. A comparative estimate was made of different methods of determination of rates of water exchange and of their applicability. (Josefson-USGS)

GROUNDWATER RECHARGE FROM A PORTION OF THE SANTA CATALINA MOUNTAINS,
Arizona Univ., Tucson. Dept. of Soils, Water, and Engineering.
R. A. Belan, and W. G. Matlock.
In: Hydrology and Water Resources in Arizona and the Southwest, Proc. of the 1973 meetings of the Arizona Section-AWRA and the Hydrology Section-Arizona Academy of Science, May 4-5, 1973, Tucson, Arizona, p 33-40, 1973. 3 fig, 1 tab, 11 ref.

Descriptors: *Aquifers, *Groundwater recharge, *Groundwater basins, *Geohydrologic units, Groundwater, Infiltration, Precipitation(Atmospheric), Surface runoff, Geology, Faults(Geologic), Arroyos, Joints(Geologic), Alluvial fans, Well data, Hydraulic gradient, Flow nets, Water quality, Transmissivity, Darcy's Law, *Watersheds(Basins), Mountains, *Arizona.

The geohydrology of a portion of the Santa Catalina Mountains including the definition of aquifer systems in the foothills was studied in order to calculate groundwater recharge to the Tucson Basin. This underlying groundwater aquifer is the only source of Tucson, Arizona's water supply. A well network, well logs, geologic profiles, and a water level contour map were used as source information. Recharge was found to occur in some sections of washes and close to the mountains where washes cross or coincide with faults. Significant recharge to sand and gravel aquifers occurs directly through faults and joints. Little of the surface runoff is thought to recharge local aquifers because of low permeability layers beneath the alluvium and the short duration of the flows. Recharge calculation using the Darcy equation was subject to considerable error; but flow net analysis showed the total recharge to be 336 acre-feet per year representing about 50 acre feet per mile of mountain front per year. (Mastic-Arizona)

THE EFFECT OF DATA DENSITY ON GROUNDWATER CONTOURING ACCURACY,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
P. R. Davis, and W. G. Matlock.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 16, No 6, p 1112-1116, November-December, 1973. 7 fig, 1 tab, 3 ref.

Descriptors: Investigations, *Groundwater basins, *Contours, *Mapping, *California, *Data collections.

The effect of different data densities on contour maps representing fairly uniform data was investigated. Tests were conducted in California on a groundwater basin of 780 sq miles. The Standard Map for the basin was drawn from 445 randomly located data points which covered an interior area of 411 sq miles. Spacings between input points of 1, 4, and 6 miles were analyzed with three tests each on the 4 and 6 mile spacings. Tests were also made on a 6 mile triangular grid and a semirandom grid obtained by dividing the area into squares 6 miles on a side and then randomly selecting a grid interaction within each square. The number of tests conducted was insufficient to draw any conclusions, but the tests support the belief that the more observations there are, the more accurately the surface will be defined. For investigations where detailed groundwater contour maps are not required, a data density with approximately 4 miles between points is suggested. Additional data points may be added near the fringes if extended control is necessary. (Merritt-FIRL)

FLOW TOWARD PERIODIC TITLE DRAINS,
Wisconsin Univ., Milwaukee. School of Architecture.
I. Gyuk, A. Soriano, and G. M. Karadi.
Journal of Hydrology, Vol 19, No 2, p 113-129, June, 1973. 9 fig, 3 ref. OWRR A-029-WIS(3).

Descriptors: *Drainage, *Groundwater, *Tile drainage, Subsurface drainage, Drainage practices, Drainage systems, Soil water movement, Drainage engineering, Mapping, Flow.
Identifiers: Conformal mapping.

The method of conformal mapping is applied to the analysis of transient flow toward parallel periodic drains in a semi-infinite aquifer taking into consideration the non-linear boundary conditions on the free surface. The mapping function is expressed as a power series in time and the seepage domain is mapped onto a domain of an auxiliary complex variable. Mapping is performed in such a manner that the free surface will always remain the real axis. Calculations are carried out for different ratios of drain depth to drain spacing using various drain diameter to depth ratios. (Skogerboe-Colorado State)

UNSTEADY FLOW TO BOTTOM DRAIN IN BOUNDED AQUIFER,
Northwestern Univ., Evanston, Ill. Technological Inst.
R. J. Krizek, A. Soriano, and I. Gyuk.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 99, No IR2, p 169-182, June, 1973. 6 fig, 11 ref.

Descriptors: *Groundwater, *Aquifers, *Aquifer characteristics, Drainage, Tile drains, Irrigation, Seepage, Transition flow, *Unsteady flow, Mapping.
Identifiers: Conformal mapping, Complex variables.

The problem of transient seepage toward a drain at the bottom of a homogeneous, isotropic aquifer is presented. The dependent variables are the position of the free surface, the flow rate, and the pore pressure distribution around the drain, and these are determined as functions of time for various depths of drainage and drain sizes; the characteristics of the aquifer are specified in terms of its coefficient of permeability and its effective porosity. The mathematical statement of this problem yields to a time-dependent potential field within a strip domain by the impervious bottom, the moving free surface, and a small semicircular contour representing the drain. To overcome the difficulty of a moving boundary, a conformal mapping technique is used to transform the problem into a new plane in which the free surface remains straight and fixed. The solution of the problem is found to the third order of time, and an upper bound is given to limit the range within which it is valid. (Skogerboe-Colorado State)

GEOTHERMAL POTENTIAL OF IDAHO,
Idaho Bureau of Mines and Geology, Moscow.
S. H. Ross.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 975-1008, 1973. 13 fig, 2 tab, 68 ref.

Descriptors: *Thermal water, *Geothermal studies, *Idaho, Thermal springs, Hot springs, Hydrothermal studies, Mineral water, Thermal power.
Identifiers: *Geothermal power.

The first comprehensive inventory and evaluation of thermal groundwater in the State of Idaho since 1925 shows that such water can be expected in wells and springs almost anywhere along the margins of the Snake River Plain or in valleys south of the Plain. In addition, about one-half of the ap-

proximately 200 thermal springs in the state emerge from granitic rocks or silicic volcanic rocks along the borders of the Idaho batholith. Although no stream has been observed, water in a few wells is boiling, and temperatures of many springs are only slightly lower. Sodium and bicarbonate are the dominate ions in most waters, although a few highly mineralized springs are the sodium-chloride type. Specific electrical conductance of thermal waters from granitic rocks averages between 300 and 400 micromhos/cm at 25 deg C; average conductivity of thermal water from volcanic rocks is somewhat higher. Much of the water usually high in silica and fluoride, even though concentrations of other minerals are low. (See also W74-08973) (Knapp-USGS)
W74-08974

GEOTHERMAL PROSPECTS IN NEW MEXICO,
New Mexico Bureau of Mines and Mineral Resources, Socorro.
W. K. Summers.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1009-1014, 1973. 3 fig, 2 tab, 6 ref.

Descriptors: *Thermal water, *Geothermal studies, *New Mexico, Thermal springs, Hot springs, Hydrothermal studies, Mineral water, Thermal power.
Identifiers: *Geothermal power.

Fifty-seven areas in New Mexico discharge groundwater at a temperature of 90 deg F or higher. Thermal waters occur in the western half of the state, primarily in the Rio Grande and Gila-San Francisco drainage basins. Only 16 areas have been discovered by wells, whereas 30 areas are marked by springs. The water issues from rocks ranging from Precambrian to Cenozoic age with the Cenozoic rocks predominating. The waters are associated with igneous and sedimentary rocks in about equal proportions. The water occurs primarily in areas of extensive volcanism and secondarily in fault zones. The water discharges from springs near streams but mostly at points well above the river levels. The discharge may be from fractures directly from beneath a talus cover, from alluvium, or from some combinations of these. (One spring discharges from a tufa mound). The median pH is 7.7, the median maximum temperatures is about 105 deg F, the median discharge of springs is 30.5 gpm, and the median concentration of sodium is 167 ppm, of magnesium 6.9 ppm, of calcium 37.6, of lithium 0.30 ppm, and of potassium 10.0 ppm. The most promising prospects for natural stream in New Mexico are the Animas Valley in Hidalgo County, the Cliff-Gila-Riverside area in Grant County, the southern Rio Grande trough, and the Upper Jemez River Basin. GEOTHERMAL RESOURCES OF GUATEMALA, CENTRAL AMERICA,
Instituto Nacional de Electrificacion (Guatemala).
R. Fernandez-Rivas.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1015-1025, 1973. 5 fig, 4 tab, 34 ref.

Descriptors: *Geothermal studies, *Thermal water, Thermal springs, Hot springs, Hydrothermal studies, Thermal power, Hydrogeology.
Identifiers: *Geothermal power, *Guatemala.

Guatemala offers possibilities for the exploitation of geothermal energy as there are some thermal evidences near Amatitlan Lake, Zunil, Aguas Amargas, and Aguas Georginas. A map shows the thermal regions of Amatitlan. A list of the principal known volcanoes is given. (See also W74-08973) (Knapp-USGS)
W74-08976

GEOTHERMAL RESOURCES OF COSTA RICA.
Servicio Nacional de Electricidad, San Jose (Costa Rica).
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1026-1029, 1973. 2 tab.

Descriptors: *Geothermal studies, *Thermal water, Thermal springs, Hot springs, Hydrothermal studies, Thermal power, Hydrogeology.
Identifiers: *Geothermal power, *Costa Rica.

A short description of the development of electric energy in Costa Rica is given. Numerous areas exhibit geothermal manifestations, but studies conducted in this field are scanty. These areas are generally associated with Quaternary volcanic systems. The most promising springs are found in Las Hornillas on the southern side of the Miravalles volcano, and Las Pailas on the southern side of the Rincon de la Vieja volcano. THERMAL AND MINERAL SPRINGS IN UGANDA,
Uganda Geological Survey and Mines Dept., Entebbe.
C. G. Dixon, and W. H. Morton.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1035-1038, 1973. 3 tab, 8 ref.

Descriptors: *Geothermal studies, *Thermal water, Thermal springs, Hot springs, Hydrothermal studies, Thermal power, Hydrogeology.
Identifiers: *Geothermal power, *Uganda.

The geothermal power potential in Uganda and the thermal springs are described. The temperatures of the springs vary from quite cool to boiling. The salinity of the mineral springs of Uganda varies greatly from one to another, both as regards the quantity and the chemical composition of the dissolved solids. The salinity of individual springs is known to have changed in the course of time. For instance, the water of Kibiro had 5.98 grams of dissolved solids per liter in the year 1920, 10.92 in 1921, and 22.28 in 1935. Most of the thermal and mineral springs of Uganda are in or near the Western Rift Valley and its associated volcanic centers, while five are in the eastern part of the country not far from the Eastern Rift Valley of Kenya. During 1954 three boreholes were drilled at Durange in order to investigate the possibility of locating supplies of geothermal steam. In No. 1 borehole the highest temperature recorded was 58 deg C at the main rift fault zone, which was penetrated at a depth of 564-579 feet. In No. 2 borehole the highest temperature was 55 deg C, and drilling was stopped at 1,294 feet after the main fault zone had been penetrated. In No. 3 borehole, which was located 150 feet west of No. 1, the highest temperature recorded was 72 deg C. (See also W74-08973) (Knapp-USGS)

GEOTHERMAL RESOURCES IN TANZANIA,
Tanzania Mineral Resources Div., Dodoma.
M. A. Nzaro.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1039-1043, 1973. 1 fig, 1 tab, 10 ref.

Descriptors: *Geothermal studies, *Thermal water, Thermal springs, Hot springs, Hydrothermal studies, Thermal power, Hydrogeology.
Identifiers: *Geothermal power, *Tanzania.

Thermal springs are numerous in Tanzania but their distribution and local concentration is uneven. The main areas of spring activity are in the neighorhood of the rift valleys and block faulted regions associated with the rift systems. In other areas, springs are related to local rock formations such as limestones, quartzites, lavas and sandstones. The existence of thermal springs indicates the presence of geothermal energy. Suitable structures are very likely to occur in Tanzania, in areas where karoo or more recent sediments overlie the basement rocks, and in the vicinity of the springs in the Tertiary volcanic provinces. GEOTHERMAL RESOURCES IN INDIA,
Central Water and Power Commission, New Delhi (India).
B. R. R. Iyengar.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1044-1049, 1973. 3 fig, 2 tab, 19 ref.

Descriptors: *Geothermal studies, *Thermal water, Thermal springs, Hot springs, Hydrothermal studies, Thermal power, Hydrogeology.
Identifiers: *Geothermal power, *India.

Geothermal fields were discovered at several places in India. Neither systematic nor exhaustive studies of these fields have so far been carried out, except for the provision of limited tourist and bathing facilities at the spring sites. No direct relationship has as yet been established between igneous activity and the occurrence of thermal springs. On the basis of limited information, it would appear that the geothermal resources in India are mostly in the form of hot water, with the near-surface temperatures varying from about 80 deg C to just over 100 deg C. Higher flows, temperatures, and pressures are likely to be obtained by drilling at suitable sites in the Pugga and Manikaran geothermal fields. The observed temperature of water in the well at Cambay was about 100 deg C. There are indications that temperatures of the order of 170 deg C may exist at depth in this field. It has been estimated that the maximum amount of power generation would be available by flashing down the water. The maximum generation possible at this point is about 1850 to 2300 kW, based on the estimated flow of each well. On the basis of similar studies, the possible power generation at Manikaran would be in the order of 350 kW and, in the case of Pugga Valley springs, about 400 kW. (See also W74-08973) (Knapp-USGS)
W74-08980

A PROGRAM FOR THE EXPLORATION OF HIGH TEMPERATURE AREAS IN ICELAND,
National Engineering Authority, Reykjavik (Iceland).
S. Bjornsson.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1050-1054, 1973. 4 fig, 1 tab.

Descriptors: *Geothermal studies, *Investigations, *Hydrogeology, *Aquifer testing, Drilling, Exploration, Hydrothermal studies, Borehole geophysics, Thermal water, Thermal power, Costs, Data collections, Hydrologic data.
Identifiers: *Geothermal power, *Iceland.

In regional geothermal surveys in Iceland, all relevant methods of geology, geochemistry and geophysics are applied to obtain a primary model

of the hydrothermal system and to locate favorable production sites within the area. After a production site is selected, exploratory drilling is carried out. The objective of the drilling is to verify and modify the primary model of the hydrothermal system. It will also furnish critical information for designing production wells and evaluating whether exploitation of the area will be technically possible and economically feasible. If the results of this phase are promising, production drilling and testing will be carried out in several steps to test the production capacity and the reliability of the thermal area. Regional surveys are estimated to take 1-3 years, exploratory drilling at each production site 1-2 years, and production drilling and testing 1-3 years. (See also W74-08973) (Knapp-USGS)

GEOTHERMAL EXPLORATION OF HOT WATER SOURCES IN THE CARPATHIANS OF YUGOSLAVIA AND CZECHOSLOVAKIA,
Scintrex Ltd., Concord (Ontario).
B. Krcmar, and B. Milanovic.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1059-1062, 1973. 8 fig.

Descriptors: *Geothermal studies, *Investigations, *Hydrogeology, *Aquifer testing, Drilling, Exploration, Hydrothermal studies, Borehole geophysics, Thermal water, Thermal power, Costs, Data collections, Hydrologic data.
Identifiers: *Geothermal power, *Yugoslavia, *Czechoslovakia.

There are many hot water sources in the Carpathian system in both Czechoslovak and Yugoslav territories. Temperature measurements are accomplished with the use of the Czechoslovak geothermometer GT-1, which enables sensitive gradient measurements in shallow boreholes at the depth of approx. 0.9 and 1.4 meters. Many of the sources are of small capacity, with temperatures under 70 deg C, but due to suitable mineralization they are appropriate for balneological purposes. Results from Yugoslav localities Vranjska Banja and Sijarinska Banja give some hope of economic potential for power exploitation. (See also W74-08973) (Knapp-USGS)

THERMAL FIELDS OF THE EASTERN CARPATHIANS,
Akademiya Nauk URSR, Kiev. Institut Geofiziki.
R. I. Kutas, and V. V. Gordiyenko.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1063-1066, 1973. 2 fig, 1 tab, 6 ref.

Descriptors: *Geothermal studies, *Thermal water, Thermal springs, Hot springs, Hydrothermal studies, Thermal power, Hydrogeology.
Identifiers: *Geothermal power, *USSR(Carpathians region).

Heat flow was studied in 43 boreholes within the southwestern slope of the Russian Platform and in the folded Carpathians of the USSR. Four tectonic zones with different geological records have been distinguished in terms of heat flow values: the slope of the Russian Platform and a part of the Carpathian foredeep with the Pre-Cambrian basement--1.05 micro/sq cm/sec; the northern part of the Lvov and Carpathian foredeep with the Paleozoic basement--1.30 micro/sq cm/sec; folded Carpathians--1.75 micro/sq cm/sec; Trans-Carpathian trough--2.15 micro/sq cm/sec. Heat flow depends on the geological age of a given area and does not agree with crustal thickness. The zones of abnormally high heat flow result from the effect of nonstationary heat sources occurring near the crustal bottom. The period of activity of the heat sources shows good agreement with the period of folding in the Carpathians as deduced from the geological evidence. (See also W74-08973) (Knapp-USGS)

Studies of the principles governing the area extent of thermal waters over USSR territory, and estimates of their heat potential, mineralization, and composition, delineate ten territories for possible utilization. Among them are the platform regions where ther thermal waters are stratified and folded areas, where fissure-vein type hot waters are found. Within these promising regions possible reserves have been estimated for thermal waters with a mineralization not exceeding 35 g/liter, a temperature above 40 deg C, and at a depth not exceeding 3,000 m. These reserves are over 250 cu m per sec. (See also W74-08973) (Knapp-USGS)

THERMAL WATERS OF GEORGIA,
Gruzinskii Politekhnicheskii Institut, Tiflis (USSR).
I. M. Buachidse, G. I. Buachidse, and M. P. Shaorshadse.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1092-1101, 1973. 2 fig, 1 tab, 10 ref.

Descriptors: *Geothermal studies, *Thermal water, Thermal springs, Hot springs, Hydrothermal studies, Thermal power, Hydrogeology.
Identifiers: *Geothermal power, *USSR(Georgia).

Thermal waters have been known in Georgia, USSR, since ancient times. Various types of thermal waters are found in Georgia from fresh hydrocarbonate calcium to highly mineralized chloride. In gas composition, nitrogen prevails though carbon dioxide and hydrocarbons are found. Thermal waters discharge in three places in the folded system of the Great Caucasian southern slope, are widely developed on the Georgian block and in the folded system of the Adjara-Trialeti, and are also found at some points in the Artvin-Somkhiti block. The Georgian block is the richest in thermal waters. The main thermal horizon is in lower-Cretaceous deposits, which, for the most part, contain low mineralized infiltrated waters of modern age, atmospheric nitrogen, temperatures reaching 105 deg C, and a total debit of 650 liter/sec. In the Adjara-Trialeti folded system, the most important waters are those of the Middle-Eocene deposits, which are typical of the nitrogen thermal waters of modern age with temperatures of 70 deg - 80 deg C and a total output of 210 liter/sec. Thermal waters of Georgia are used (and in the future will be used more widely) at the balneologic resorts, in greenhouse economy, in the processing industry, and for the local heating systems of small and medium populated areas. RECENT HYDROTHERMAL SYSTEMS OF KAMCHATKA,
Institut Vulkanologii, Petropavlovsk-Kamchatskii (USSR).
E. A. Vakin, B. G. Polak, V. M. Sugrobov, E. N. Erlikh, and V. I. Belousov.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1116-1133, 1973. 11 fig, 4 tab, 25 ref.

Descriptors: *Geothermal studies, *Thermal water, Thermal springs, Hot springs, Hydrothermal studies, Thermal power, Hydrogeology.
Identifiers: *Geothermal power, *USSR(Kamchatka).

Recent hydrothermal activity was studied in Uzon-Semyachik, Pauzhetka-Kambalny and other regions in Kamchatka. In the area of recent volcanism characterized by a general increase of conductive heat flow, some regions can be distinguished by an especially intense geothermal regime with additional supply of heat by deep

fluids. Recent hydrothermal systems of Kamchatka are small artesian basins and artesian slopes. They are associated with volcano-tectonic grabens and circular depressions filled with a series of tufaceous material of mainly acid composition. Usual hydrodynamic methods can be used for a quantitative estimation of reserves. Hydrothermal activity is one of the manifestations of the general geothermal activity of the region. W74-08989

GEOLOGY AND GEOTHERMAL POWER POTENTIAL OF THE TATUN VOLCANIC REGION,
Mining Research and Service Organization, Taipei (Taiwan).
C. H. Chen.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1134-1143, 1973. 5 fig, 1 tab, 13 ref.

Descriptors: *Geothermal studies, *Thermal water, Thermal springs, Hot springs, Hydrothermal studies, Thermal power, Hydrogeology.
Identifiers: *Geothermal power, *Taiwan(Tatum volcanic region), Republic of China.

Geothermal resources in the Tatun volcanic region of Taiwan occur in an area of about 350 sq km containing Plio-Pleistocene andesitic and basaltic lavas, pyroclastics, and detritus. Most of the andesitic lavas in the region are compact and impermeable. Unless highly fractured they cannot be good reservoir rock. The basement is composed of Miocene sediments of marine and continental facies. The Lower Miocene Wuchihshan formation consists mainly of thick-bedded to massive sandstone that could be good reservoir rock. There are 13 hot-spring areas in the volcanic region, which constitute a zone about 18 km long and 3 km wide, extending from Peitou to Chinshan. Most of the hot springs issue acid sulphate-chloride water. Acid chloride water with temperatures lower than 200C and pH values less than 4 was found in the Wuchihshan sandstone under the Tahuangtsui thermal area. Wet steam containing about 25% of water (maximum temperature > 240 deg C, pH = 3.9 to 6.7) was found in fractured andesites under the Matsao thermal area. The power potential of the whole hot-spring zone is conservatively estimated to be 80 MW to 200 MW. (See also W74-08973) (Knapp-USGS)
W74-08990

RECENT PLANS OF GEOTHERMAL EXPLOITATION,
Japan Metals and Chemicals Co. Ltd., Morioka. Geothermal Power Div.
Y. Mori.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1144-1149, 1973. 4 fig, 2 tab.

Descriptors: *Geothermal studies, *Thermal water, Thermal springs, Hot springs, Hydrothermal studies, Thermal power, Hydrogeology.
Identifiers: *Geothermal power, *Japan.

Prospecting in Japan is being carried out in order to build two more geothermal powerplants besides the one of 20,000 kW now in operation. The exploitable area seems to be wider than first expected, and the Kakkonda River area is more advantageous in natural resources than Matsukawa. Kakkonda is located 7 km southwest of Matsukawa. Here, the steaming ground stretches as far as a 3 x 5 km area without any caprock. Cooling water is also abundant, and the amount is ten times as much as that of Matsukawa. Chemical quality of the steam is excellent with pH 7-8 compared with 5 in the case of Matsukawa. The power in prospect at Kakkonda is approximately 200,000 kW while that of Matsukawa amounts to only 100,000 kW. The topography is not as steep as in Matsukawa. (See also W74-08973) (Knapp-USGS)
W74-08991

EXPLOITATION OF THE MATSUKAWA GEOTHERMAL AREA,
Japan Metals and Chemicals Co. Ltd., Morioka. Geothermal Power Div.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, p 1150-1156, 1973. 6 fig, 4 tab.

Descriptors: *Geothermal studies, *Investigations, *Hydrogeology, *Aquifer testing, Drilling, Exploration, Hydrothermal studies, Borehole geophysics, Thermal water, Thermal power, Costs, Data collections, Hydrologic data.
Identifiers: *Geothermal power, *Japan(Matsukawa).

In Matsukawa, Japan, the local government of the village began in 1952 the experimental development of hot springs for health purposes. In this process steam blew out (instead of hot water) from a depth of 150-300 meters. In 1960, two wells 350 and 425 meters deep were experimentally drilled. The temperature in those bores changed seasonally, partly because of the low temperature of the underground water near the land surface. New wells for steam production should be as deep as 1200 meters. Construction of a 5,000 kW electric plant was planned. In 1964 the construction work started. In 1965 the first plan for 5,00 kW was changed to 20,000 kW. The discharge of No 1 well decreased, and one more well had to be added. At present, steady full load operation is 20,000 kW. The power capacity in the Matsukawa area is estimated to be approximately 100,000 kW; investigations are being continued. See also W74-08973) (Knapp-USGS)
W74-08992

THE GEOTHERMAL SYSTEM OF THE KAKONE VOLCANO,
Hot Spring Research Inst. of Kanagawa Prefecture, Hakone (Japan).
Y. Oki, and T. Hirano.

Descriptors: *Geothermal studies, *Thermal water, Thermal springs, Hot springs, Hydrothermal studies, Thermal power, Hydrogeology.
Identifiers: *Geothermal power, *Japan(Hakone Volcano).

The isothermal map of the Hakone volcano, Japan, at sea level shows that the geothermal area now 12 by 13 km in diameter is clearly related to the present volcanic activity. Four zones are recognized in the distribution of thermal waters. Zone I is characterized by acid-sulfate water associated with solfataric gases, and is found at the highest elevation of the volcano. Zone II is characterized by bicarbonate-sulfate water issuing at the middle elevation. Zone III has high-temperature streams rich in sodium chloride, poor in bicarbonate and sulfate, flowing from the depth of active fumaroles across the zone of bicarbonate-sulfate water (zone II). Zone IV is characterized by sodium chloride-bicarbonate-sulfate water discharged at the lowest elevation. Groundwater which infiltrates through the western side of the caldera seems to be flowing eastward, passing through the basal part of central cones where high-temperature dense steam is coming up through volcanic vents. Subsurface streams of high-temperature waters thus start from the vent area, run through the permeable zone mixing with groundwater, and appear as hot springs on the steep slopes of the Hayakawa gorge at the east. The average contribution of volcanic dense steam rich in sodium chloride is estimated to be 25 to 35% to the sodium chloride water of zone III. Thermal discharge evaluated by the geochemistry of sodium chloride water is 21 to 30 million cal/sec, which suggests that the energy economy of the Hakone geothermal system is essentially controlled by the activity of dense steam carrying a considerable amount of sodium chloride. TYPES OF COMMERCIAL DEPOSITS OF THERMAL UNDERGROUND WATERS AND SOME VIEWS ON THE ASSESSMENT OF THEIR RESERVES,
Vsesoyuznyi Nauchno-Issledovatelskii Institut Gidrogeologii i Inzhenernoi Geologii, Moscow (USSR).
N. M. Frolov, and G. S. Vartanian.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1167-1174, 1973. 4 fig, 17 ref.

Descriptors: *Geothermal studies, *Investigations, *Hydrogeology, *Aquifer testing, Drilling, Exploration, Hydrothermal studies, Borehole geophysics, Thermal water, Thermal power, Costs, Data collections, Hydrologic data.
Identifiers: *Geothermal power.

All known ground thermal water occurrences of the world may be grouped into the following main types, based on geological and hydrodynamic conditions: thermal water occurrences of large artesian basins of platform areas; thermal water occurrences of small artesian basins of intermontane areas and submontane troughs of alpine zones of folding; and thermal water occurrences of crystalline massifs connected with fissure-vein systems of recent tectonic disturbances. Large artesian thermal water occurrences occur usually at a great depth and are notable for a high salinity. Among the thermal water occurrences of alpine type, thermal water occurrences confined to the areas of late and recent volcanism are of the greatest industrial interest. THERMAL STUDIES AS A TECHNIQUE IN SUBSURFACE STRUCTURAL INVESTIGATIONS,
Akademiya Nauk Azerbaidzhanskoi SSR, Baku. Inst. of Problems of Deep Oil and Gas Deposits.
S. T. Ovnatanov, and G. P. Tamrazyan.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1184-1190, 1973. 4 fig.

Descriptors: *Geothermal studies, *Investigations, *Hydrogeology, *Aquifer testing, Drilling, Exploration, Hydrothermal studies, Borehole geophysics, Thermal water, Thermal power, Costs, Data collections, Hydrologic data.
Identifiers: *Geothermal power.

Thermal studies can be used to reveal the peculiarities of the geological structure of oil- and gas-bearing regions. The studies conducted make it possible to get valuable information concerning the subsurface structure. These studies help to find buried uplifts. On the basis of thermal studies the subsurface occurrence (under marine conditions) of a gas-mud volcano was predicted. The drilling conducted later confirmed the presence of the volcano. Forecasting of the buried mud volcanoes is used to locate the occurrence of oil- and gas-bearing suites at depth. Also, the study of thermal subsurface fields helps to determine the conditions of distribution of oil and gas reservoirs, which is of practical importance in field prospecting and development. GEOHYDROLOGY OF THE LAUGARNES HYDROTHERMAL SYSTEM IN REYKJAVIK, ICELAND,
National Energy Authority, Reykjavik (Iceland).
T. Thorsteinsson, and J. Eliasson.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1191-1204, 1973. 11 fig, 4 tab, 8 ref.

Descriptors: *Geothermal studies, *Investigations, *Hydrogeology, *Aquifer testing, Drilling, Exploration, Hydrothermal studies, Borehole geophysics, Thermal water, Thermal power, Costs, Data collections, Hydrologic data.
Identifiers: *Geothermal power, *Iceland.

A geohydrologic survey was made in 1965 in the Laugarnes hydrothermal system in Reykjavik, Iceland. The survey was conducted by recording gages and by periodic measurements of water levels in nonpumping wells. A mathematical analysis of the relation between water levels and pumping rates and of the response of the water level to changes in atmospheric pressure, oceanic tides, and earthquakes shows the effects of volume elasticity of the Laugarnes aquifers and their water. The test data gave values ranging from 0.0035 to 0.0088 for the coefficient of transmissivity and 0.000039 to 0.00032 for the coefficient of storage. The aquifers appear to be impermeably bounded on two sides, the boundaries intersecting at an angle of 60 to 90 degrees. A decline of water level of 66.8 meters was computed for the period January 1957 to August 1969, and a further decline of 6.2 meters for the 5-year period August 1969 to August 1974, assuming 1968 to 1969 pumping rates. GEOTHERMAL FIELDS IN JAPAN CONSIDERED FROM THE GEOLOGICAL AND PETROLOGICAL VIEW POINT,
Hokkaido Univ., Sapporo (Japan). Dept. of Geology and Mineralogy.
T. Ishikawa.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1205-1211, 1973. 3 fig, 16 ref.

Descriptors: *Geothermal studies, *Thermal water, Thermal springs, Hot springs, Hydrothermal studies, Thermal power, Hydrogeology.
Identifiers: *Geothermal power, *Japan.

Heat sources of most geothermal fields in Japan are related to young volcanoes or pre-Quaternary intrusives. Acidic magmas are more significant for generation of geothermal areas than basic ones. In Japan, geothermal areas nearly always develop around lava domes built of dacite and andesite. Lava domes plug crater vents and prevent gas and heat accumulated at depth from excaping into the air. W74-08997

CONTINENTAL DRIFT AND THERMAL FIELDS,
Akademiya Nauk Azerbaidzhanskoi SSR, Baku. Institut Geologii.
G. P. Tamrazyan.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1212-1225, 1973. 9 fig, 15 ref.

Descriptors: *Geothermal studies, *Termal water, Thermal springs, Hot springs, Hydrothermal studies, Thermal power, Hydrogeology.
Identifiers: *Geothermal power, *USSR, *Continental drift.

The separation of platform regions during continental drift results in large depressions in which the more intensively heated deep-seated masses approach the earth surface. Major thermal anomalies originate in these areas. All the most important high-temperature regions of the USSR (the West-Siberian, Turan, Caspian lowlands, the pre-Caucasus, the Kuban lowland, the Crimea Stedpe, and other regions) are situated just between the separated edges of the West-Siberian ruptured joint and in its branchings. The continental drift ideas are of paractical importance with regard to prospecting for the interior heat of the earth, as they outline vast areas characterized by sharply intensified heat fields. GEOTHERMAL RESOURCES AND PRESENT OROGENIC ACTIVITY,
Stutthart Univ. (West Germany). Geologisch-Palaeontologisches Institut.
H. G. Wunderlich.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1226-1230, 1973. 8 fig.

Descriptors: *Geothermal studies, *Thermal water, *Orogeny, Thermal springs, Hot springs, Hydrothermal studies, Thermal power, Hydrogeology,
Identifiers: *Geothermal power, *Orogeny.

Some zones of abnormally high heat flow show a characteristic position relative to young orogenic belts. Usually, orogenic fronts are combined with low heat flow values in the foreland and high heat flow behind the front. Geothermal resources of economic interest may be expected where volcanic activity, heat conductivity of the crust, and orogenic heat concentration are working together. Young orogenic fronts are distinguished by strong negative gravity anomalies shifted outward in the foreland direction. The inner girdle of such active orogens is marked by volcanoes, by large volumes of granitic material (if enclosed in the continental crust), and by regional metamorphism as an indication of intensified heat flow. Present orogenically intensified heat flow behind the active orogenic fronts is shown by a series of maps. (See also W74-08973) (Knapp-USGS)

GEOPHYSICAL EXPLORATION THROUGH GEOLOGIC COVER,
D. W. Strangway.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1231-1243, 1973. 16 fig, 37 ref.

Descriptors: *Geothermal studies, *Investigations, *Hydrogeology, *Aquifer testing, Drilling, Exploration, Hydrothermal studies, Borehole geophysics, Thermal water, Thermal power, Costs, Data collections, Hydrologic data.
Identifiers: *Geothermal power.

Some of the techniques that can be applied to the problem of geophysical exploration beneath various kinds of cover and overburden are discussed. The electrical properties found in different geographic environments and the problems of exploring in areas of high resistivity and low resistivity cover are reviewed. Induced polarization, electromagnetic sounding, magnetotellurics and radio frequency interferometry have a particular application in areas of high resistivity cover. The problem of exploring in areas of low resistivity cover is much more difficult. The induced polarization technique can be used in these cases, but it requires a better understanding of the problems of electromagnetic coupling. New techniques of data processing and filtering can help significantly in the problem of aeromagnetic interpretation in areas of volcanic cover. (See also W74-8973) (Knapp-USGS)

GEOTHERMAL PROSPECTING IN SHALLOW HOLES AND ITS LIMITATIONS,
Institute of Applied Geophysics, Prague (Czechoslovakia).
D. Dedkova, J. Halousek, B. Krcmar, and K. Prihoda.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1244-1249, 1973. 4 fig, 8 ref.

Descriptors: *Geothermal studies, *Investigations, *Hydrogeology, *Aquifer testing, Drilling, Exploration, Hydrothermal studies, Borehole geophysics, Thermal water, Thermal power, Costs, Data collections, Hydrologic data.
Identifiers: *Geothermal power.

Difficulty of temperature measurement in boreholes considerably limits the sensitivity depth of geothermal investigations. From the point of view of the attainable accuracy and reproducibility, error sources, both instrumental and in the temperature field itself, are analyzed. The design of a Czechoslovak geothermometer GT-1 with reproducibility better than 0.04 deg C is comprehensively described. Some possibilities of improvements in geothermal prospecting in shallow holes, such as the gradient method, standard points method, and long-term variation corrections, are outlined. Some examples of hydrogeological, sulfidic ores, and speleological investigations are given. (See also W74-08973) (Knapp-USGS)

ORIGIN OF GEOTHERMAL WATERS OR NATURAL STEAM,
Mineral Research and Exploration Inst., Ankara (Turkey).
S. Kavlakoglu.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1250-1255, 1973. 12 fig, 17 ref.

Descriptors: *Geothermal studies, *Thermal water, Thermal springs, Hot springs, Hydrothermal studies, Thermal power, Hydrogeology.
Identifiers: *Geothermal power.

For the generation of geothermal water or natural steam, a reservoir of meteoric water, a heat source, and a mass of dynamic meteoric water circulating through natural permeable channels to the heat source and back to the meteoric water reservoir through a different permeable channel are required. A discussion is given for two cases; one for the case of heated meteoric water, the other for heated meteoric water mixed with juvenile water from the heat source. Using Darcy's law with the theoretical treatment of invasion, it is shown that the heated water from the heat source would invade the static reservoir along a wide based cylindrical zone in both cases. Verification of this theoretical finding was demonstrated through geophysical and drilling results at the Gecik-Afyon and Saraykoy-Denizli geothermal areas in Turkey and the Broadlands geothermal area in New Zealand. EVALUATION OF OPERATIONAL RESERVES OF HIGH TEMPERATURE WATERS,
Institut Vulkanologii, Petropavlovsk-Kamchatskii (USSR).
V. M. Sugrobov.

In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1256-1260, 1973. 3 fig, 2 tab, 6 ref.

Descriptors: *Geothermal studies, *Investigations, *Hydrogeology, *Aquifer testing, Drilling, Exploration, Hydrothermal studies, Borehole geophysics, Thermal water, Thermal power, Costs, Data collections, Hydrologic data.
Identifiers: *Geothermal power, USSR.

Resources of geothermal steam in the USSR are at present evaluated on the basis of the discharge of steam-water mixture. Evaluation of exploitational resources of thermal waters for a certain period of exploitation of a deposit may be done by definition of the decline of piezometric level according to the unsteady filtration formula. Continuous exploitation of the systems is maintained by outflow of heat, which is located in the heated rocks, and by the inflow of the geothermal deep-seated steam to the zone of depression with intensive outflow of the mass and heat from the upper horizons. HEAT AND MASS TRANSFER IN HYDROTHERMAL SYSTEMS, PHYSICAL-MATHEMATICAL MODELS AND EXPERIMENTS,
Institut Geokhimii, Irkutsk (USSR).
V. N. Kochergin, and V. D. Pampura.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1266-1269, 1973. 3 fig, 2 ref.

Descriptors: *Heat transfer, *Mass transfer, *Hydrothermal studies, *Geothermal studies, Convection, Mathematical models, Hydraulic models, Heat flow, Thermal conductivity, Hydraulic conductivity.
Identifiers: USSR.

In order to investigate processes of heat and mass transfer as well as the dynamics of the formation of temperature fields of natural hydrothermal systems, physico-mathematical models were developed which accounted for conditions of contemporary hydrothermal processes (temperature, pressure, thermo-physical properties, of rocks, and latent heats of transitions). The mathematical model consists of a system of partial differential equations for a two-layer medium (liquid and solid) with an immobile boundary between solid and liquid phases. Models of this type were performed on an IBM computer. Physical models were carried out by means of a hydrothermal experiment at elevated temperatures (up to 200 deg C) and pressures. STUDY OF HEAT CONDUCTION MODELS OF GEOTHERMAL ENERGY RESERVOIRS,
Mining Research and Service Organization, Taipei (Taiwan).
C. Y. Meng, and P. T. Shaw.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1270-1274, 1973. 9 fig, 3 ref.

Descriptors: *Heat transfer, *Mass transfer, *Hydrothermal studies, *Geothermal studies, Convection, Mathematical models, Hydraulic models, Heat flow, Thermal conductivity, Hydraulic conductivity.
Identifiers: USSR.

Temperature anomalies in a rock formation are direct evidence of the existence of geothermal reservoirs. Prospecting for geothermal energy by measurement of the temperature gradient in the rock formation overlying a geothermal reservoir could, theoretically, be effective. Thermal conduction models of different presumed geothermal reservoir shapes are discussed. A geothermal reservoir is considered to be a constant hot body overlain by physically uniform rock formations. Temperature distribution in the overlying rock formation may be represented by the surfaces of constant temperature whose shapes are closely related to the shape of the hot body. The shape of temperature curves at equal depth in a vertical cross-section reflects also the depth, shape, and size of the geothermal energy reservoir. The differences in material and inflow of groundwater in the overlying formation would seriously affect the temperature distribution, the shape of the constant temperature surfaces, and the shape of the temperature curve for the equal depths, consequently making them differ from the models. HEAT TRANSFER MEASUREMENT IN THE OWAKUDANI AND SOUNZAN GEOTHERMAL AREAS, HAKONE VOLCANO,
National Research Center for Disaster Prevention, Tokyo (Japan).
K. Yuhara.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970. Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1280-1288, 1973. 9 fig, 6 tab, 8 ref.

Descriptors: *Geothermal studies, *Hydrothermal studies, *Heat transfer, *Heat flow, Volcanoes, Stream, Sampling, Thermal water, Thermal springs, Data collections, Borehole geophysics, Mass transfer, Thermal conductivity.
Identifiers: *Geothermal power, *Japan.

In geothermal areas, heat is transferred by various processes, such as fumaroles, steam wells, hot springs, steaming grounds, evaporation from hot pools and thermal conduction through the earth. As a practical example, heat transfer measurements in the Owakudani and Sounzan geothermal areas of Hakone volcano, Japan, are outlined. Total mass discharge from these areas amounts to 129 kg/sec and total heat transfer amounts to 10.24 million cal/sec. In Japan where there are about twenty geothermal areas, each having the same size as the Owakudani and Sounzan areas put together, the thermal discharge from all these areas may be estimated roughly to be 2 x 10 to the 23rd power erg/year. In addition to this, the energy released by volcanic activity is 7 x 10 to the 23rd power erg/year, by common hot springs, 1.1 x 10 to the 24th power erg/year, and by the normal heat flow of nonvolcanic regions, 7.3 x 10 to the 24th power erg/year. The total energy released from the whole of Japan, except that by earthquakes, is about 9 x 10 to the 24th power erg/year. (See also W74-08973) (Knapp-USGS)

AN ESTIMATE OF THE NATURAL HEAT RESOURCES IN A THERMAL AREA IN ICELAND,
Oregon State Univ., Corvallis. Dept. of Oceanography.
G. Bodvarsson.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1289-1293, 1973. 1 fig, 10 ref.

Descriptors: *Geothermal studies, *Investigations *Hydrogeology, *Aquifer testing, Drilling, Exploration, Hydrothermal studies, Borehole geophysics, Thermal water, Thermal power, Costs, Data collections, Hydrologic data.
Identifiers: *Geothermal power, *Iceland.

Various geological and geophysical principles involved in te exploitation of geothermal areas are summarized for the Hengill high-temperature thermal area located 30 to 40 km east of the city of Reykjavik, Iceland. The rate at which stored heat can be tapped depends on the availability of water. An estimate of the order of magnitude of the total recoverable heat resources in the Hengill area, based on a reservoir model, indicates that a total of the order of 10,000 million metric tons of water at 220 to 230 deg C could be produced in this area during a period of 100 years. This water is flashed in the boreholes and will yield a total of 250 million tons of dry saturated steam with a pressure ranging from 10 to 2 atmospheres. The estimated production rate of steam is of the order of 3000 tons/hour, or comparable to the production which has already been obtained in the geothermal area at Larderello in Tuscany, Italy. The production costs, based on the rate of 300 tons/hour of steam, are estimated at $ 0.16/ton steam, and the investment necessary is estimated at $5,000.00/ton steam/hour. Corresponding figures for larger installations would probably be somewhat lower. (See also W74-08973) (Knapp-USGS)

EFFECT OF EARTH STRAIN ON GEYSER ACTIVITY,
Colorado Univ., Boulder. Dept. of Mechanical Engineering.
J. S. Rinehart.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1297-1301, 1973. 8 fig, 9 ref.

Descriptors: *Geothermal studies, *Hydrothermal studies, *Geysers, *Earthquakes, Strain, Movement, Thermal water, Stress.
Identifiers: *Yellowstone National Park, *Earth strain.

The very extensive and detailed records that have been kept for the past three decades on the activity of Old Faithful Geyser, located in Yellowstone National Park, make it possible to establish causative relationships between earth strain and geyser activity. A 2- or 3- year steady decrease in average interval between eruptions can precede a large earthquake. This is followed at the time of the earthquake by a sudden lengthening of interval which continues for about fifteen days. Local earthquakes of intensity V or greater can be presaged and accompanied by a gradual and regular decrease in interval over a time span of a few days, followed by an abrupt increase. Such a pattern of change is not always accompanied by an earthquake; this probably indicates non-catastrophic release. of strain. While the effects of varying earth strains are recognizable, they do not appear to be a major factor in controlling the efflux of geothermal energy. (See also W74-08973) (Knapp-USGS)

Identifiers: *Geothermal power, *Japan(Otake).

Thermal discharge, temperature gradient and thermal conductivity of rock samples were measured at Otake geothermal area, Japan. The heat flow from the strong fumaroles was measured by condensing the natural steam. The heat flow from the weak fumaroles was measured by using a wet and dry bulb thermometer. The underground temperature gradient is 1.9 deg C/m in steaming ground and 0.8 deg c/m in other geothermal areas. The thermal conductivity of 30 dried core samples was measured in the laboratory and in situ by means of the line sorce methods. The range is 0.000773 to about 0.0172 cal/sec cm C. The thermal conductivity of unaltered rocks is greater than that of altered ones. (See also W74-08973) (Knapp-USGS)

Descriptors: *Geothermal studies, *Hydrothermal studies, *Water yield, *Thermodynamics, Hydrogeology, Discharge(Water), Drawdown, Steam, Hydrodynamics, Boreholes.
Identifiers: *Well efficiency, *Geothermal power, *Well performance.

Geothermal boreholes were studied to estimate maximum discharges when drawing on (a) a source of pressurized hot water, (b) a source of dry or superheated steam. Where infinite permeability existing at depth (which is common in areas similar

to that at Wairakei, New Zealand), only geometry of the hole controls the flow rate. Also investigated was the effect on discharge of increased hole size throughout the depth or over fractions of the depth, with resultant flow increases quantitatively established. The relationships derived enable fall in borefield discharge to be predicted for known decline in temperature and pressure within the reservoir. The enthalpy may be accurately determined by a method using the maximum running pressure, the wellhead pressure at which imminent collapse of the stream-water mixture occurs, and the bottom hole pressure. A critical discharge pressure tapping located at the pipe outlet face may then measure flow rates direct over a range of wellhead pressures and hence supply the data required to plot the borehole characteristic curve. The conditions were also considered where rock permeability controls the flow into the bottom of boreholes either from radial fissures or from permeable-porous media. SOME ASPECTS OF APPROXIMATING AQUIFER DISCHARGE,
Army Engineer District, Los Angeles, Calif. Flood Plain Management Section.
D. L. Gundlach.
Ground Water, Vol 12, No 3, p 135-139, May-June 1974. 5 fig, 1 tab, 4 ref.

Descriptors: *Water yield, *Discharge(Water), *Groundwater movement, *Darcy's law, Aquifer characteristics, Transmissivity, Artesian aquifers, Confined water, Equations.

Differential equations based on Darcy's equation and the equation of continuity give the steady-flow discharge rate for confined aquifers in which the cross-sectional area and permeability vary from point to point. For the general cast the derived discharge expression is theoretically exact, whereas, for specific cases an approximate form can be used depending on the boundary conditions. Integration of the approxmiate form for a given aquifer length yields simplified solutions for discharges where the variation in cross-sectional area and permeability with distance in the direction of flow can be described by some mathematical expression. DIGITAL-COMPUTER PROGRAMS FOR ANALYSIS OF GROUND-WATER FLOW,
Geological Survey, Little Rock, Ark.
M. S. Bedinger, J. E. Reed, and J. D. Griffin.
Open-file report, 1973. 85 p, 10 fig, 4 tab, 9 ref.

Descriptors: *Computer programs, *Groundwater movement, *Surface-groundwater relationships, *Evapotranspiration, Mathematical models, Water level fluctuations, Hydrogeology, Finite element analysis, Numerical analysis.

Three digital computer programs--GROUNDWATER FLOW, RIVER-INDUCED FLUCTUATIONS, and EVAPOTRANSPIRATION apply digital-computer solutions to previously described mathematical and hydrologic techniques. The GROUNDWATER FLOW program computes the head response in an aquifer to various boundary conditions. The EVAPOTRANSPIRATION program computes the steady-state relation between evapotranspiration and depth to water as a function of thickness and layering of fine-grained material overlying the aquifer. The output from EVAPOTRANSPIRATION is applicable in some problems as boundary criteria in the GROUNDWATER FLOW program. The RIVER-INDUCED FLUCTUATIONS program accepts as input the unit change in stream stage computed by GROUNDWATER FLOW. Using the unit response of the aquifer and a hydrograph of the stream, RIVER-INDUCED FLUCTUATIONS computes the head fluctuations in the aquifer induced by the changes in river stage. (Knapp-USGS)

Descriptors: *Hydraulic conductivity, *Penetration, *Calcareous soils, *Sodium, Sulfur, Sulfides, Acids, Acid mine water, Soils, Carbonates, Neutralization, Salts, Carbon dioxide, Arizona, Alkali soils.
Identifiers: *Sulfuric acid, Saturation point.

Measurements of penetrability and hydraulic conductivity in calcareous soils treated with a dilute sulfuric acid solution showed a severe decrease in conductivity with increasing concentrations over 1000 ppm. A slight decrease in penetrability was observed. Carbon dioxide evolution appeared to be responsible for flow reduction and temporary cessation at 10,000 ppm and 20,000 ppm. In sodic soils penetrability and conductivity increased markedly with sulfuric acid concentrations between 1,000 and 10,000 ppm. For a neutral soil, penetrability decreased with increasing sulfuric acid concentrations, and the stable conductivity for 500 to 5,000 ppm was higher than for water alone. The findings suggest that disposal of sulfuric acid concentrations greater than 1,000 ppm will result in plugging by carbon dioxide. In sodic soils the possibility exists of using sulfuric acid solutions for reclaiming salt and sodium-affected soils. (Mastic-Arizona)

CALCIUM-MAGNESIUM-POTASSIUM EQUILIBRIA IN SOME CALIFORNIA SOILS,
California Univ., Davis. Dept. of Pomology.
R. M. Carlson, and J. R. Buchanan.
Soil Science Society of America Proceedings, Vol 37, No 6, p 851-855, November-December, 1973. 5 fig, 3 tab, 19 ref.

Descriptors: *Salinity, *Ion exchange, Ions, Leaching, Fertilizers, *Potassium, Nutrient removal, Equilibrium, *California, *Calcium, *Magnesium.

Ion exchange equilibria in several soils were studied to seek equilibrium equations that could be used in chromatographic models dealing with movement and distribution of fertilizer potassium in soil profiles. Soil samples were equilibrated with mixtures of CaC12, MgC12, and KC1 solutions and then extracted with NH4OAc to determine exchangeable cation compositions at equilibrium. It was necessary to correct the exchangeable cation concentrations by subtracting the cations extracted from nonexchangeable sources by NH4OAc. Vanselow's, Davis', Gapon's or Kerr's equation would not describe the equilibria. Equations were developed to describe the equilibria. (Skogerboe-Colorado State)

FURTHER EVIDENCE FOR THE INABILITY OF THE KJELDAHL TOTAL NITROGEN METHOD TO FULLY MEASURE INDIGENOUS FIXED AMMONIUM NITROGEN IN SUBSOILS,
Nebraska Univ., Lincoln. Agricultural Experiment Station.
V. W. Meints, and G. A. Peterson.
Soil Science Society of America Proceedings, Vol 36, No 3, p 434-436, May-June, 1972. 2 tab, 6 ref.

Descriptors: *Fertility, *Nutrients, *Nitrogen, *Soil chemical properties, Subsoil, Nitrates.
Identifiers: *Ammonium-nitrogen.

Three methods of Kjeldahl total N determinations in soils were compared. Method 1 involved a pretreatment of the soil with a HF-acid mixture and resulted in higher N values than methods 2 or 3 which involved a long period of digestion and a modification of a Gunning method, respectively. Differences in total N values obtained by the three methods were greatest for subsoils. The inability of methods 2 and 3 to measure all of the indigenous fixed ammonium-nitrogen resulted in low N values and erroneously high C:N ratios in the subsoil. (Skogerboe-Colorado State)

Estacion Experimental de Riego y Cultivos, Viedma (Argentina). Tecnico en Fertilidad de Suelos.
R. S. Lavado.
Anales do la Sociedad Cientifica Argentina, Vol 5, No 195, 2nd Series Applied Science, No 33, p 135-141, March-June, 1973. 4 fig, 2 tab, 11 ref.

Descriptors: *Phosphorus, *Soils, *Saline soils, *Alkaline soils, Calcium sulfate, *Flooding, Gypsum.
Identifiers: *Argentina(Rio Negro).

The evolution of available phosphorus in a salty-alkaline soil of the Lower Valley of the Rio Negro was investigated. In general, flooding is thought to cause an increase of the available phosphorus in the soil. Calcium sulfate also seems to increase the availability of pshosphorus. Soil was flooded several times with big sheets of water after applying gypsum. The results show that, statistically, there were no significant variations in the amount of available phosphorus. (Merritt-FIRL)

CONTROLLED INSTANTANEOUS APPLICATION OF FREE WATER TO A POROUS SURFACE,
Purdue Univ., Lafayette, Ind. Dept. of Agronomy.
S. D. Swartzendruber, and M. S. Asseed.
Soil Science Society of America Proceedings, Vol 37, No 6, p 967-968, November-December, 1973. 1 fig. OWRR B-014-IND(7).

Descriptors: *Porous media, *Infiltration, Seepage, *Flow measurement, Control systems, Pressure head.
Identifiers: Water application.

Instantaneous application of free water to a porous-medium surface is achieved essentially by a device in which the central feature is a plastic plate perforated with small holes. The pressure head of the water can be controlled at a preselected value between 0 and 1 cm. Water enters the porous medium at essentially zero external flow resistance, while volume and time of entry can be measured accurately. No lateral flow of free water occurs, thus eliminating the disturbing effects of such flow on the porous-medium surface. (Sandoski-Franklin)

INTERACTING DIFFUSE LAYERS IN MIXED MONO-DIVALENT IONIC SYSTEMS,
Volcani Inst. of Agricultural Research, Bet Dagan (Israel).
E. Bresler.
Soil Science Society of America Proceedings, Vol 36, No 6, p 891-896, November-December, 1972. 7 fig, 1 tab, 19 ref.

Descriptors: *Cation exchange, *Cations, Analog computers, Computer models, *Ion exchange, Soils, Clays.

A numerical solution of the electric double-layer problem for the case of overlapping diffuse layers in mixed monovalent-divalent ion systems, is used to obtain a series of graphs for various cation compositions in the external solution. In these graphs, the electric potential is expressed as a function of the surface charge density, the concentration of the two cations in the equilibrium solution, and the distance between platelets in various ionic mixtures. The graphs cover most of the situations usually encountered in soil systems, and are not sensitive to the valency of the anions present. They are used to estimate the electrostatic effect on cation exchange equilibria, swelling pressures, and electrokinetic phenomena in mixed-ion clay systems. Application of these estimates to theoretical analyses and comparisons between theoretical models and experimental data are illustrated. Some of the examples used for this illustration are based on work previously published by others. (Skogerboe-Colorado State)

A. G. Hornsby, and J. M. Davidson.
Soil Science Society of America Proceedings, Vol 37, No 6, p 823-828, November-December, 1973. 7 fig, 2 tab, 12 ref.

Descriptors: *Adsorption, Solutes, *Soil water, Soil moisture, Salinity, Measurement, Mathematical models.
Identifiers: *Desorption, Miscible displacement, Dispersion coefficient, *Solute transport model, *Fluometron.

A technique is described for measuring the solution and adsorbed phases of fluometuron in water-saturated soil columns. The data reveal that at an average pore-water velocity of 5.5 cm/hour, the solution and adsorbed phases of fluometuron are not in equilibrium, whereas, at the 0.59 cm/hour velocity they were in equilibrium. The kinetic rate equations for adsorption and desorption were not significantly better than the equilibrium model when describing the fast displacement of fluometuron through soils. The desorption distribution coefficient was found to be a function of the maximum amount of herbicide adsorbed prior to desorption. The experimental data were reasonably well described by the mathematical model. (Skogerboe-Colorado State)

APPLICATION OF THE GREEN AND COREY METHOD FOR COMPUTING HYDRAULIC CONDUCTIVITY IN HYDROLOGIC MODELING,
Oak Ridge National Lab., Tenn.
R. J. Luxmoore.
Available from NTIS, Springfield, Va. 22151 as EDFB-IBP-73-4 Price $3.00 printed copy; $1.45 microfiche. International Biological Program Report EDFB-IBP-73-4, April 1973. 22 p, 11 ref, append.

Descriptors: *Hydraulic conductivity, *Soil water movement, *Computer programs, Saturated flow, Unsaturated flow.

The Green and Corey method for computing the relationship of hydraulic conductivity and soil water content was implemented as a subroutine (SOIL) and coupled with a table lookup subroutine (TABLOK) for use in soil-water modeling at several sites in the Eastern Deciduous Forest Biome. Readily available input data (water content vs pressure, saturated conductivity) are used in the SOIL subroutine to compute unsaturated conductivity. Three data arrays (water content, pressure, conductivity) are set up in SOIL and used in TABLOK such that at a given value of soil-water content the corresponding values for pressure and conductivity are calculated by linear interpolation. Outlines of the computational methods and program listings are given together with example calculations. Two modified methods for calculating conductivity are compared with the Green and Corey method. One modification uses an unsaturated conductivity matching value. The other uses a linearly weighted matching factor, based on both saturated and unsaturated conductivity values. Any one of the three methods can be used in the SOIL-TABLOK subroutines. The package can provide an effective bridge between available data and the input data requirements of a physically based soil-water model. (Knapp-USGS)

SEISMIC REFRACTION ANALYSIS OF WATERSHED MANTLE RELATED TO SOIL, GEOLOGY, AND HYDROLOGY,
Forest Service (USDA), Rapid City, S. Dak. Rocky Mountain Forest and Range Experiment Station.
T. Yamamoto.
Water Resources Bulletin, Vol 10, No 3, p 531-546, June 1974. 8 fig, 3 tab, 15 ref.

Descriptors: *Seismic studies, *Soil water movement, *Rainfall-runoff relationships, *Hydrogeology, Water balance, Alpine, Infiltration, Data collections, Geophysics, Sampling, Subsurface investigations, Hydrograph analysis, Cores, Duration curves, *South Dakota.

A seismic refraction survey was carried out in three contiguous watersheds (217, 89, and 190 acres) on a laccolith near Sturgis, South Dakota. Isopachs, area-elevation curves (hyposmetry), and structure contours were used together with drill cores, petrography, hydrographs, and soil information to interpret the nature and role of porous mantle in the behavior of the watersheds. Refraction profiles produced only one geologically meaningful seismic contrast within the laccolith. Drill cores indicated a shallow stony profile on a sheeted horizon terminating on isotropic crystalline rock impervious except for tight joints. Refraction and core interpretations were not statistically different. Apparent seismic discontinuities deeper within the bedrock lacked geological identity. Storm hydrographs and water yields are better related to soil type differences and porous mantle distribution than to average porous mantle depth. Slopes of flow-duration curves correlate with average porous mantle depth. Porous mantle isopachs, hypsometry, and soil type delineation are complimentary in interpretation of watershed behavior. (Knapp-USGS)

SOIL RESPIRATION IN DIFFERENT TYPES OF SOUTHEAST ASIAN TROPICAL RAIN FOREST, (IN GERMAN),
Zurich Univ. (Switzerland). Institut fuer Allgemeine Botanik.
H. Wanner, S. Soerohaldoko, P. D. Natalia, G. Panggabean, and P. Yingchoi.
Oecologia (Berl). Vol 12, No 3, p 289-302, 1973. (English summary).
Identifiers: Forests, Precipitation(Atmospheric), *Soil respiration, Teak, Tropical rain forests, *Asia(Southeast).

Soil respiration was measured in different types of rain forest in West, South, and East Java and in Sarawak, North Borneo. The altitude of the experimental sites varied from sea level to 1500 m. In keeping with the different amounts and distribution of precipitation during the year, and due to the very different soil types, vegetation varied from lowland to montane rain forest, teak forest, monsoon forest and heath forest. In all these forest types soil respiration values were of the same order of magnitude. They indicate an oxidation of 10-13 tons organic matter/ha/yr. In some of the experimental sites soil respiration was measured during the rainy as well as during the dry season. The values obtained justify extrapolation to a yearly average. The difficulties connected with interpretation of the soil respiration values as equivalent to net production of the different forest types were discussed.--Copyright 1974, Biological Abstracts, Inc.

Uzbekskiy Geologicheskiy Zhurnal, No 1, p 73-76, 1974. 1 fig, 1 tab, 4 ref.

Descriptors: *Lakes, *Saline lakes, *Salts, *Lake sediments, Bottom sediments, Marl, Silts, Clays, Sands, Maps.
Identifiers: *USSR(Aral Sea).

The Aral Sea is a comparatively shallow-water basin. Mean depth is 15-20 m, and maximum depth is 62 m near the western shore. Maximum length from southwest to northeast is 428 km, and maximum width from west to east is 284 km. Marl, which occupies the central part and western deep-sea areas is predominant among bottom sediments of the sea. Silts, sands, and clays are less developed. The presence of water-soluble salts among the marine sediments attests to complete disappearance of the sea at the time and to transformation of the sea into small dry saline lakes. The Aral Sea was formed 700-1,000 years ago, which is confirmed by data on rate of accumulation of muds above the saline deposits (0.7-0.8 mm/yr). By analogy with the structure of present-day saline lakes in Soviet Central Asia it may be assumed that the thickness of the mirabilite layer under bottom sediments of the sea will be of the order of 1 m. Areas of major buried salt deposits probably reach 1,000 sq km. (Josefson-USGS)

SEASONAL CHANGES OF THE FEEDING OF THE ROACH IN THE MOZHAISK RESERVOIR (IN RUSSIAN),
Moscow State Univ. (USSR). Dept. of Ichthyology.
E. A. Zadorozhnaya.
Biol Nauki, Vol 15, No 9, p 31-34, 1972. Illus.
Identifiers: Algae, Detritus, Insect larvae, Plankton, Reservoirs, *Roach, Rutilus-rutilus, *Seasonal, *USSR(Mozhaisk reservoir), Zooplankton, Fish diets.

An investigation of the seasonal change of feeding of the roach (Rutilus rutilus) at age 4-11 yr in the Mozhaisk reservoir (USSR) showed that in the spring and early summer macrophytes, plant detritus, algae, and insect larvae predominated in the food of the roach and during the summer-fall and winter periods zooplankton of the pelagic zone predominated. The general direction in the seasonal change of feeding consisted in a decrease of aquatic vegetation and benthic food objects from spring to summer and a change to feeding on limnoplankton in the summer-fall period.--Copyright 1973, Biological Abstracts, Inc.

LAKE POWELL RESEARCH PROJECT: HYDROLOGIC RESEARCH,
California Univ., Los Angeles. Inst. of Geophysics.
G. C. Jacoby.
In: Hydrology and Water Resources in Arizona and the Southwest, Proc. of the 1973 meetings of the Arizona Section, AWRA, and the Hydrology Section-Arizona Academy of Science, May 4-5, 1973, Tucson, Arizona, p 119-123, (1973).

Descriptors: Hydrology, *Limnology, *Geochemistry, *Streamflow, Evaporation, Bank storage, Sedimentation, Dendrochronology, Colorado River, *Arizona, *Nevada, Data collections.
Identifiers: *Lake Powell.

Two administrative institutions, the University of California at Los Angeles and Dartmouth College, are undertaking several subprojects designed to investigate the hydrology of the Lake Powell region. The subprojects include studies of streamflow trends, evaporation, bank storage, sedimentation, physical limnology, and lake geochemistry. The project is concluding its first year of full-scale research. The first year of research has been devoted to setting up data collection systems and some tentative conclusions have been reached. More specific results will be furnished in the second year, particularly in regard to water budget and limnology of Lake Powell. (Mastic-Arizona)

FINAL ENVIRONMENTAL STATEMENT RELATED TO OPERATION OF NINE MILE POINT NUCLEAR STATION UNIT 1.
Directorate of Licensing (AEC), Washington, D.C.
Aval: NTIS, Springfield, Va., as Rept. No. Docket 50220-227; $10.60/copy, $1.45 microfiche. Report No. Docket 50220-227, January 1974. 471 p, 36 fig, 44 tab, 108 ref, 3 append.

Descriptors: *Lake Ontario, *Nuclear powerplants, Effluents, Environment, Administrative agencies, Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *New York.
Identifiers: *Environmental Impact Statement, *Boiling water reactors.

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the proposed conversion of the current provisional operating license to a full-term license for the Nine Mile Point Nuclear Station Unit 1. The plant is located on Lake Ontario in the state of New York and will employ a boiling-water reactor cooled by once-through flow of water obtained from and discharged to Lake Ontario. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion is to convert the current provisional operating license to a full-term license for the facility subject to the following conditions: (1) construct a new radwaste facility; (2) establish a revised and comprehensive environmental monitoring program; (3) provide an analysis and course of action for any evidence for potential irreversible damage detected. WATER BALANCE OF LAKE BAYKAL (VODNYY BALANS OZ. BAYKAL),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
Z. A. Vikulina, and T. D. Kashinova.
In: Voprosy rezhima i issledovaniya ozer i vodokhranilishch; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 203, p 3-33, Leningrad, 1973. 1 fig, 22 tab, 15 ref.

Descriptors: *Lakes, *Water balance, *Hydrologic cycle, Inflow, Precipitation(Atmospheric), Discharge(Water), Runoff, Evaporation, Water levels, Water level fluctuations, Lake basins, Watersheds(Basins).
Identifiers: *USSR(Lake Baykal).

Water balance of Lake Baykal was refined on the basis of recent observations and calculations. A comparison of data on items in the water balance of the lake for a 70-year period (1901-70) and for the last 38 years (1933-70) shows that variations in surface inflow, lake runoff, and lake level fluctuations do not exceed 2%-5%. Maximum differences occur in determination of evaporation and precipitation values, which, according to calculations by the State Hydrologic Institute on data from 1933-70, increased by more than 40% over those obtained by earlier investigators. The volume of water actually participating in the hydrologic cycle of the lake is 73 cu km as compared with 70 cu km established earlier. Nonuniform inflow and discharge of water in different parts of the lake contribute to intensified circulation of water masses. The annual volume of water flowing from the northern part of the lake to the southern part through the Selenga shoals is 36 cu km. (See also W74-09100) (Josefson-USGS)

REFINEMENT OF THE PRECIPITATION AMOUNT AS APPLIED TO CALCULATION OF WATER BALANCE OF LAKE BAYKAL, (UTOCHNENIYE VELICHINY OSADKOV PRIMENITEL'NO K RASCHETU VODNOGO BALANSA OZ. BAYKAL),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
A. A. Natrus, and I. A. Mukhacheva.
In: Voprosy rezhima i issledovaniya ozer i vodokhranilishch; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 203, p 34-48, Leningrad, 1973. 1 fig, 9 tab, 26 ref.

Descriptors: *Lakes, *Water balance, *Precipitation(Atmospheric), Precipitation gages, Rain gages, Gaging stations, Winds, Evaporation, Mapping, Isohyets.
Identifiers: *USSR(Lake Baykal), Tret'yakov precipitation gages.

Assessment of precipitation is very important in determining its role in the water balance of Lake Baykal. A number of corrections must be applied to precipitation-gage readings to assess the amount of precipitation on the water surface. The most important corrections to be applied are those of the effect of wind on the instruments, precipitation losses to wetting of the precipitation gage (bucket), and precipitation losses to evaporation from the bucket. To obtain a uniform long-term precipitation evaluation, a correction must be allowed for reducing the precipitation amounts measured by rain gages standing 2 m high and surrounded by a shield to the precipitation amounts measured by Tret'yakov precipitation gages. As compared with earlier calculations, refinement of the precipitation amount for Lake Baykal was 100 mm, i.e., 25% of the long-term average. (See also W74-09100) (Josefson-USGS)
W74-09102

RESULTS OF ON-SITE INVESTIGATIONS OF CURRENTS IN THE SOUTHERN PART OF LAKE BAYKAL (REZUL'TATY NATURNYKH ISSLEDOVANIY TECHENIY V YUZHNOM BAYKALE),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
M. M. Aynbund.
In: Voprosy rezhima i issledovaniya ozer i vodokhranilisch; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 203, p 49-70, Leningrad, 1973. 7 fig, 10 tab, 11 ref.

Descriptors: *Lakes, *Currents(Water), *On-site investigations, Mapping, Water circulation, Movement, Velocity, Rates, Winds, Ice cover, Flow measurement, Current meters, Floats, Buoys, Seasonal.
Identifiers: *USSR(Lake Baykal), Longshore currents.

Currents in the southern part of Lake Baykal were measured in 1965-67 during the ice-free season and during the period of complete ice cover. The major factor in the formation of currents in the southern part of the lake during the ice-free season is that of wind. The effects of other factors are negligible. The stability of prevailing currents varies throughout the lake and increases from summer to fall. Average current velocities in the southern part of the lake during the navigation period vary between 12 and 18 cm/sec at a depth of 15 m and between 4 and 8 cm/sec at a depth of 50 m. Current velocity generally increases significantly from summer to fall. Influence of the bank manifests itself in the 1-1.5 km-wide littoral zone and is reflected in lower (by a factor of 2-2.5) velocities of longshore currents and in formation of eddies of varying types and sizes. As a result, transport is considerably less in the littoral zone than at a distance of 1.5-3 km from the bank. A prevailing cyclonic cycle formed before start of complete ice cover is retained in upper layers under the ice. Current velocities in winter are negligible in all regions in the southern part of the lake. Local circulations and eddies produced by turbulence are strongly developed in deep layers (900-1,200 m) during complete ice cover. (See also W74-09100) (Josefson-USGS)
W74-09103

PROBLEM OF THE PROCESSES OF INTERNAL WATER EXCHANGE AND TURBULENCE IN LAKE BAYKAL (K VOPROSU O PROTSESSAKH VNUTRENNEGO VODOOBMENA I TURBULENTNOSTI NA OZ. BAYKAL),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
V. A. Znamenskiy.
In: Voprosy rezhima i issledovaniya ozer i vodokhranilishch; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 203, p 71-79, Leningrad, 1973. 4 fig, 2 tab, 5 ref.

Descriptors: *Lakes, *Turbulence, *Water circulation, Movement, *Water chemistry, Mixing, Eddies, Dissolved solids, Littoral, Surveys, Mapping, Equations.
Identifiers: *USSR(Lake Baykal), *USSR(Selenga River), *Water exchange, Mineralization.

Internal exchange of water between individual parts of the lake, character of turbulence in the littoral zone, and distribution of waters of the Selenga River were investigated in hydrochemical surveys in the southern part of Lake Baykal in 1967-69. The surveys were performed by an expedition of the Hydrochemical Institute of the Main Administration of the Hydrometeorological Service (GUGMS) and were conducted at the surface, mid-depth, and bottom of the lake. Large-scale turbulent eddies governing the mixing and transport of water masses and dissolved chemical and organic substances were found to exist in the littoral zone of the lake. W74-09104

A DYNAMIC METHOD AND ITS APPLICATION TO INVESTIGATIONS OF CURRENTS IN INLAND BODIES OF WATER (DINAMICHESKIY METOD I YEGO PRIMENENIYE DLYA ISSLEDOVANIY TECHENIY VO VNUTRENNIKH VODOYEMAKH),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
T. V. Rotatova, and T. N. Filatova.
In: Voprosy rezhima i issledovaniya ozer i vodokhranilishch; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 203, p 80-124, Leningrad, 1973. 15 fig, 9 tab, 40 ref.

Descriptors: *Stage-discharge relations, *Inland waterways, *Lakes, *Currents(Water), Bodies of water, Density currents, Height, Depth, Circulation, Water circulation, Air circulation, Velocity, Wind velocity, Winds, Current meters, Water quality, Meteorology, Temperature, Isotherms, Mapping, Equations.
Identifiers: *USSR, *Dynamic height method, Gradient currents, Drift currents, Wind currents, Geostrophic currents, Convective currents.

Possibilities of the dynamic height method for investigation of currents in inland bodies of water are limited by (1) absence of generally accepted concepts of types of currents that can be calculated by this method and (2) absence of sufficiently complete studies summarizing its adaptation to freshwater conditions. Fundamentals of the dynamic method are discussed; possibility of its application to investigation of currents in inland freshwater bodies is considered; computed and observed characteristics of currents are compared; and concepts of the types of currents calculated by the dynamic method are refined. The method is applied to Lakes Ladoga, Issyk-Kul' and Baykal in the Soviet Union, Lakes Huron and Michigan in the United States, Lake Constance (Bodensee) on the border between Germany, Austria, and Switzerland, and Lake Ohrid in southern Yugoslavia and eastern Albania. (See also W74-09100) (Josefson-USGS)
W74-09105

LONG-TERM CHARACTERISTICS OF THE TEMPERATURE REGIME OF LAKE LADOGA (MNOGOLETNIYE KHARAKTERISTIKI TEMPERATURNOGO REZHIMA LADOZHSKOGO OZERA),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
V. A. Misyuk.
In: Voprosy rezhima i issledovaniya ozer i vodokhranilishch; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 203, p 125-147, Leningrad, 1973. 8 fig, 8 tab, 5 ref, append.

Descriptors: *Lakes, *Thermal properties, *Water temperature, Thermocline, Heat, Heating, Cooling, Shallow water, Deep water, Depth, Littoral, Isotherms, Mapping, Seasonal.
Identifiers: *USSR(Lake Ladoga).

The close relation which exists between surface water temperature in the open part of a lake and temperature recorded by gaging stations can be used to determine 10-day and monthly water temperatures for littoral, intermediate, and deep-water zones as well as for the entire lake. Isotherms, constructed in 1963-70 at different depths during the second phase of spring warming, the summer period, and the first phase of autumnal cooling, give a graphic picture of the distribution of water masses of Lake Ladoga and show that warmest waters are in the southeastern region and that coldest waters are in northern and northwestern regions. The maximum depth of wind mixing is 30 m. At the start of spring warming the thermocline occurs only in the southern shallow-water zone. Cold waters having a temperature of about 4 deg C or less are located at this time in middle and northern parts of the lake. With additional entry of heat into the lake the thermocline in the southern part descends and forms in middle and northern parts of the lake. Maximum temperature gradients are observed in July-August in the upper layers of water to a depth of 10 m. Advection of cold northern water masses into the southern shallow-water part of the lake occurs in July-September. Storage of heat in the lake is calculated, and recommendations call for additional studies of the lake's thermal regime. (See also W74-09100) (Josefson-USGS)
W74-09106

DEPTH DISTRIBUTION OF WATER TEMPERATURE IN THE KAKHOVKA RESERVOIR (RASPREDELENIYE TEMPERATURY VODY PO GLUBINE V KAKHOVSKOM VODOKHRANILISHCHE),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
V. M. Klaven.
In: Voprosy rezhima i issledovaniya ozer i vodokhranilishch; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 203, p 148-160, Leningrad, 1973. 5 fig, 2 tab, 5 ref.

Descriptors: *Reservoirs, *Water temperature, *Depth, *Distribution, Air temperature, Wind velocity, Thermal stratification, Summer, Fluctuations, Cross sections.
Identifiers: *USSR(Kakhovka Reservoir).

Characteristics of the thermal regime of the Kakhovka Reservoir in southeastern Urkaine were investigated in May-August 1970-71. Water temperature in a surface layer in deep water and in a littoral zone in an area of measurement differs only slightly. The range of daily fluctuations in a surface layer during summer months is 1-2 deg C, and only on individual hot days does it reach 6-8 deg C. The difference between surface and bottom water temperatures at the temperature station and at sections across the reservoir is 0.1-0.5 deg C on stormy days but reaches 5-7 deg C on calm, hot days. Four characteristic types of depth distribution of water temperature are identified: (I) isothermal conditions with a temperature difference between surface and bottom layers, not exceeding 0.5 deg C; (II) a smooth temperature drop from surface to bottom, ranging from 0.5 to 1.5 deg C; (III) a sharp temperature drop from the surface to a depth of 1.5-4.0 m, ranging from 1.5 to 7.0 deg C; and (IV) presence of three expressed layers: the epilimnion, metalimnion, and hypolimnion. The temperature difference between surface and bottom layers is 1.5-5.0 deg C. Isothermal conditions (type I) prevail during most (73%) of the summer season. Type III stratification during summer months is more frequent (14%) than type IV stratification (5%), while the duration of type II stratification occupies a middle position (8%). (See also W74-09100) (Josefson-USGS)

THERMAL CHARACTERISTICS AND VERTICAL EXCHANGE IN MEROMICTIC LAKES AS ILLUSTRATED BY LAKE GEK-GEL' (TERMICHESKIYE OSOBENNOSTI I VERTIKAL'NYY OBMEN V MEROMIKTICHESKIKH OZERAKH NA PRIMERE OZ. GEK-GEL'),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
T. N. Filatova, and M. A. Fortunatov.
In: Voprosy rezhima i issledovaniya ozer i vodokhranilishch; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 203, p 161-185, Leningrad, 1973. 6 fig, 5 tab, 57 ref.

Descriptors: *Lakes, *Meromixis, *Water circulation, *Thermal properties, Water temperature, Thermal stratification, Thermocline, Thermal conductivity, Convection, Turnovers, Seasonal, Mixing, Mixolimnion, Epilimnion, Hypolimnion, Probability, Curves, Equations.
Identifiers: *USSR(Lake Gek-Gel'), *Meromictic lakes, Metalimnion, Monimolimnion, Thermoisopleths.

Lake Gek-Gel' is located in Azerbaydzhan, 30 km south of Kirovabad, at a height of 1,650 m above sea level on slopes of the Morov-Dag mountain range. The area of the lake is 0.79 sq km; length is 2.5 km; and maximum width is 0.5 km. Maximum depth, which is about 100 m, occurs in the middle part of the lake. The shape of the lake basin is conical. Distribution of water temperature on the lake surface is similar to that on the surface of lakes in temperate latitudes. The water layer of the mixolimnion of the lake in May-November is divided into the epilimnion, metalimnion, and hypolimnion. The metalimnion is the most clearly expressed. Maximum temperature gradients in it are observed in July and reach 5 deg/m or more. In July-August the probability of vertical temperature gradients of about 1 deg/m is 99%, that of 2 deg/m--50% and that of 5 deg/m or more--1%. A stable temperature approaching 5 deg is maintained throughout the year in the monimolimnion located at a depth below 20 m. In July-August vertical exchange in the lake approaches molecular exchange. During other periods of direct stratification, vertical exchange is approximately of the order of 1-2 times higher than molecular exchange. Similarity in vertical distribution of water and in hydrochemical and hydrobiological indices in Lake Gek-Gel' and the Black Sea may be due to similar conditions of vertical exchange in the two bodies of water, although in Lake Gek-Gel' the rate of vertical exchange during the period of sharp stratification is of an order lower than in the Black Sea. Data are presented on the best studied ectogenic, crenogenic, and biogenic meromictic lakes of the world. (See also W74-09100) (Josefson-USGS)

A COMPARATIVE ESTIMATE OF ENERGY LOSSES IN WATER BODIES AND IN TRANQUIL AND TURBULENT FLOWS (SRAVNITEL'NAYA OTSENKA POTER' ENERGII V VODOYEMAKH, SPOKOYNYKH I BURNYKH POTOKAKH),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
V. A. Znamenskiy.
In: Voprosy rezhima i issledovaniya ozer i vodokhranilishch; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 203, p 186-199, Leningrad, 1973. 3 fig, 1 tab, 8 ref.

Descriptors: *Subcritical flow, *Turbulent flow, *Bodies of water, *Energy loss, *Estimating, Fluid mechanics, Hydraulics, Hydraulic gradient, Slopes, Reynolds number, Froude number, Velocity, Viscosity, Turbulence, Chezy equation, Roughness(Hydraulic), Friction, Resistance, Chutes, Bottom sediments.
Identifiers: *USSR.

Problems in estimation of energy losses for different types of flows are considered. Basic indicators are hydraulic gradient, Reynolds and Froude criteria, and relative smoothness of the bottom surface. Analytical expressions are obtained for determining total energy losses and coefficients of

hydraulic friction in water bodies and chutes, where bottom roughness is a static phenomenon. The analytical relations proposed agree with conclusions from Prandtl's semiempirical theory and with results of experimental investigations of kinematic characteristics of the bottom layer. Relations proposed for flows in water bodies can be used to determine mean velocity and coefficients of turbulent exchange. (See also W74-09100) (Josefson-USGS)

STATISTICAL AND SPECTRUM ANALYSES OF WIND WAVES ON THE KAYRAKKUM RESERVOIR (STATISTICHESKIY I SPEKTRAL'NYY ANALIZY VETROVOGO VOLNENIYA NA KAYRAKKUMSKOM VODOKHRANILISHCHE),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
M. I. Krivoshey, and R. B. Kudryashova.
In: Voprosy rezhima i issledovaniya ozer i vodokhranilishch; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 203, p 200-222, Leningrad, 1973. 8 fig, 2 tab, 16 ref.

Descriptors: *Reservoirs, *Waves(Water), *Statistical methods, Correlation analysis, Probability, Wind velocity, Winds, Fetch, Curves, Equations.
Identifiers: *USSR(Kayrakkum Reservoir), *Wind waves, *Spectrum analysis, Pearson distributions, Correlograms.

The Kayrakkum Reservoir, located in the western part of the Fergana valley on the Syr Dar'ya River, was built in 1956. The area of the reservoir is 523 sq km; length is 56 km; maximum width is 15 km; mean depth is 8 m; and maximum depth near the dam is 20-24 m. Statistical and spectrum analyses were made of several recordings of steady wind waves and an analysis was also made of the errors of computation of mean wave heights and periods in deep water of the reservoir. Distribution curves of wave heights and periods conform fairly good to the Pearson Type I distribution. Rayleigh's curve, developed under the assumption of a normal law of distribution of wave ordinates, agrees poorly with empirical data. At wind velocities of 10-15 m/sec the relative error of computation of mean wave heights after the Braslavskiy and spectral methods is practically the same and equals 5%. At a wind velocity of 5 m/sec both methods overestimate wave heights, the Braslavskiy method by 24% and the spectral method by 38%. At a wind velocity of 5 m/sec the Labzovskiy method overestimates wave heights by 68%. At a wind velocity of 10-12 m/sec the error of computation is zero and at a wind velocity of 15 m/sec it is 7%. W74-09110

VOLUME OF WATER IN RIVERS, LAKES, AND RESERVOIRS OF THE SOVIET UNION (OB"YEM VODY V REKAKH, OZERAKH I VODOKHRANILISHCHAKH SOVETSKOGO SOYUZA),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
R. A. Nezhikhovskiy.
In: Voprosy rezhima i issledovaniya ozer i vodokhranilishch; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 203, p 239-247, Leningrad, 1973. 1 fig, 6 tab, 10 ref.

Descriptors: *Water, *Rivers, *Lakes, *Reservoirs, *Volume, Discharge(Water), Equations.
Identifiers: *USSR.

The number of rivers in the Soviet Union is 2,963,397, and their total length is 9,647,864 km. The total volume of water in the rivers is 504 cu km. The number of lakes in the country is 2,854,157, and their total water surface area is 721,644 sq km. Of the total volume of water (27,994 cu km) in lakes, 23,000 cu km or almost 82% is concentrated in Lake Baykal. The volume of water in the three largest lakes of the country (Baykal, Issyk-Kul' and Aral Sea) is 25,750 cu km or 92% of all of the country's lake water. The number of river reservoirs with a total storage of 0.001 cu km or more is 747, and the total volume of water in these reservoirs is 598 cu km. The volume of water in river reservoirs with a normal backwater level is 603 cu km. The total volume of water in all water bodies of the country is 29,101 cu km or almost 7 times the volume of annual runoff into seas, oceans, and enclosed lakes during an average water year (4,384 cu km). Water in rivers is completely renewed 8.7 times a year, i.e., every 42 days. Water in lakes and reservoirs (excluding Lake Baykal and, correspondingly, runoff of the Angara River) is renewed once every 1.3 years. Considering the land area of the Soviet Union (22,272,000 sq km) the total volume of water in water bodies corresponds to a uniform water depth of 1,300 mm, which is 6.6 times the depth of runoff (198 mm) and 2.5 times the depth of atmospheric precipitation (531 mm). (See also W74-09100) (Josefson-USGS)
W74-09111

WATER BALANCE OF WORLD LAKES AND RESERVOIRS (VODNYY BALANS OZER I VODOKHRANILISHCH ZEMNOGO SHARA),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
Z. A. Vikulina.
In: Voprosy rezhima i issledovaniya ozer i vodokhranilishch; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 203, p 248-262, Leningrad, 1973. 4 tab, 12 ref.

Descriptors: *Lakes, *Reservoirs, *Water balance, *Hydrologic cycle, Inflow, Precipitation(Atmospheric), Discharge(Water), Runoff, Evaporation, Water level fluctuations, Geographical regions, North America, Europe, Asia, Africa.
Identifiers: *USSR.

Quantitative estimates are made of the volumes of water which contribute to the hydrologic cycle of major and some moderate-size and small lakes and reservoirs in North America, Europe, Asia, and Africa. The volume of water participating in the hydrologic cycle of major lakes in North America is 440 cu km, in Europe--126 cu km, in Asia--172 cu km, and in Africa--153 cu km. The proportion of major incoming components--surface inflow and precipitation--in the water balance of lakes in North America is 55% and 45%, respectively; in Europe--80% and 20%, in Asia--83% and 17%, and in Africa--30% and 70%. The proportion of major outgoing components--runoff and evaporation--in the water balance of lakes in North America is 62% and 38%, respectively, in Europe--86% and 14%, in Asia--39% and 61%, and in Africa--32% and 68%. In areas of intense economic exploitation the total hydrologic cycle increases at the expense of large reservoirs. The volume of water participating in the water balance of Volga River reservoirs is 240 cu km or approximately twice the hydrologic cycle of large lakes of Europe. The results obtained represent the first stage in the study of the hydrologic cycle of lake waters of the world. Additional water-balance studies should include new bodies of water such as large lakes and reservoirs in South America, Australia, and Southeast Asia and should be extended to moderate-size lakes in different climatic zones of the world. SURVEY OF LAKE FLOODING FROM ERTS-1: LAKE CHAMPLAIN.
Vermont Univ., Burlington. Dept. of Geography.
Available from NTIS, Springfield, Va. 22151 as N73-27247 - Price $3.00 printed copy; $1.45 microfiche. Remote Sensing Laboratory Contract Report, June 1973. 9 p, 6 fig. NASA Contract NAS 5-21753.

Descriptors: *Lakes, *Water level fluctuations, *New York, *Floods, *Remote sensing, Satellites(Artificial), Mapping.
Identifiers: *ERTS, *Lake Champlain(NY).

ERTS-1 imagery showing seasonal lake-level conditions in Lake Champlain can be used to assess shoreline change and flooding extent. MSS bands 6 and 7 provide maximum land-water contrasts and are the most useful for shoreline location. Shoreline changes observed between ERTS coverages of October 10 (low water) and April 7 and 25 (high water) are readily apparent; enlargement of specific scenes by 4X provides data which can be transferred to a map base. The synoptic view provided by ERTS-1 makes it possible to map shoreline positions occurring at a specific lake stage. (Knapp-USGS)
W74-09231

2I. Water In Plants

LABORATORY CULTURE, GROWTH RATE, AND FEEDING BEHAVIOR OF A PLANKTONIC MARINE COPEPOD,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
M. M. Mullin, and E. R. Brooks.
Limnology and Oceanography, Vol 12, p 657-666, 1967. 2 fig, 3 tab, 29 ref.

Descriptors: *Copepods, Ecology, *Animal populations, *Growth rates, Breeding, Marine algae, Saline water, Plankton, Cultures, Diatoms.
Identifiers: *Rhincalamus nasutus, *Artemia salina.

Rhincalanus nasutus was cultured through seven consecutive generations in 19-liter carboys when provided with a mixture of diatoms and Artemia salina nauplii as food. The mean generation length was 8.7 weeks, similar to that of the local field population of this species during some seasons. Fecundity of laboratory-reared animals was lower than that of the field population. Instatnaneous coefficients of individual exponential growth (k in the expression, Wt = Woekt, where W is body weight of organic carbon and t is days) were 0.24 to 0.12/day, depending on the age of the individual. About 10 ug of detrital carbon were produced as exuviae during the growth of an individual. Even young nauplii fed preferentially on large food particles. The suggestion that the copepods' first antennae are used in the feeding process was not supported by an experimental test. R. nasutus nauplii are apparently active enough to avoid being eaten by their parents.
W74-08732

CULTURE STUDIES OF MARINE ALGAE. I. EISENIA ARBOREA,
G. J. Hollenberg.
American Journal of Botany, Vol 26, p 34-41, January 1939.

Descriptors: *Marine algae, *Life cycles, *Cytological studies.
Identifiers: *Eisenia arborea, Gametophyte plants, Laminariales.

A cytological investigation was made of critical stages in the life cycle of Eisenia arborea. The life cycle and the gametophyte plants of Eisenia arborea are essentially like those described for other members of the Laminariales.

THE DEVELOPMENT OF ARTIFICIAL MEDIA FOR MARINE ALGAE,
Haskins Labs., New York; and Marine Biological Station, Millport (Scotland).
L. Provasoli, J. J. A. McLaugillin, and M. R. Droop.
Archiv fur Mikrobiologie, Bd 25, p 392-428, 1957.

Descriptors: *Marine algae, *Cultures, Water chemistry, *Reviews.
Identifiers: The development of culture media for marine algae is traced from the time of Miquel (1890) to the present. The principles involved in designing synthetic media suitable for bacteria-free cultures of a variety of exacting organisms are discussed and an account given of their application in the United States and United Kingdom.
W74-08734

REMATING IN A PLANKTONIC MARINE CALANOID COPEPOD,
Naval Research Lab., Washington, D.C.
D. F. Wilson, and K. K. Parrish.
Marine Biology, Vol 9, p 202-204, 1971.

Descriptors: *Copepods, *Plankton, Cultures, Productivity, *Breeding.
Identifiers: *Acartia tonsa, *Remating.

The knowledge that the initial mating in planktonic copepods may be inadequate to permit realization of a female's total reproductive potential, and that remating can occur, has important implications for both population dynamics and speciation studies. Acartia tonsa Dana females in controlled laboratory experiments were successfully remated after becoming totally infertile following approximately 3 weeks of highly fertile production. Large numbers of viable nauplii resulted from these second matings.
W74-08735

CULTURE OF A PLANKTONIC CALANOID COPEPOD THROUGH MULTIPLE GENERATIONS,
Naval Research Lab., Chesapeake Beach, Md.
E. J. Zillioux, and D. F. Wilson.
Science No. 151 (3713), p 996-998, 1966 (illus).

Descriptors: *Growth rates, *Cultures, *Copepods, Productivity, *Reproduction.
Identifiers: *Acartia tonsa.

Acartia tonsa has been propagated through 12 filial generations during 1 year in small laboratory cultures. The mean generation time was 25 days at 17 degrees C on a slightly suboptimum, mixed algal diet. Body size, reproductive capacity, and generation time were unchanged during the culture period.

NATIVE INFUSORIA OF THE RIVER SVETUPE IN SUMMERTIME, (IN RUSSIAN),
Akademiya Nauk Latviiskoi SSR, Riga. Inst. of Biology.
R. A. Liepa.
Latv Psr Zinat Akad Vestis. 3, p 27-32, 1973. Illus. (English summary).
Identifiers: Fauna, *Infusoria, *Protozoa, Rivers, Temperature, *USSR(River Svetupe), Seasonal.

In the small river Svetupe (USSR) and in the estuaries of its tributaries (Perlupe, Arupe) the variety of free living protozoa appears to be insignificant. A total of 77 species of Protozoa were found: 56 in Svetupe, 28 in Perlupe and 17 in Arupe. The average number of Protozoa fluctuates from 90-160/sq.m, the maximum number 1020 thousand/sq. m, the minimum number 20 thousand/sq. m. The number of Protozoa depends on the temperature changes: the lowest number was observed in the second part of the month, when rapid lowering of the temperature occurred. The tributaries of the River Svetupe (Perlupe, Arupe), the hydrological structure and fauna of which greatly differ from that of the main stream, do not affect the structure and number of protozoa in the River Svetupe.--Copyright 1973, Biological Abstracts, Inc.
W74-08925

VASCULAR PLANTS OF WASTE STORAGE SITES IN THE 200 AREAS OF THE HANFORD RESERVATION,
Battelle-Pacific Northwest Lab., Richland, Wash.
K. R. Price, and W. H. Rickard.
Available from NTIS, Springfield, Va, as Rept No BNWL-1796; $4.00/copy, $1.45/microfiche. Report No BNWL-1796. December 1973, 7 p.

Descriptors: *Radioactive waste disposal, *Waste storage, *Washington, *Plant populations, *Vascular tissues, Tracheids, Habits, Environment, Aquatic plants, Water pollution, Nuclear powerplants, Speciation, Data collections, Ecosystems.
Identifiers: *Richland(Wash).

A brief account is presented of terrestrial, riparian and semi-aquatic plants known to be associated with radioactive waste storage sites in the 200 Areas of the Hanford Reservation. In most cases the species are characteristic of those which generally inhabit the reservation, but some plants are restricted to specialized habitats provided by particular waste storage sites. It is impractical to list all species growing at each waste storage site because of seasonal variation and changes brought about by environmental management practices. An alphabetical listing has been prepared with an example of where each species is known to occur. This list will be updated as needed and expanded to include other waste storage areas. Plant specimens were collected during spring and fall when flowering material was available. Herbarium mounts were prepared of many specimens and have been retained as part of the Hanford Reservation herbarium collection. Identification to species level was made whenever possible. (Houser-ORNL)
W74-08967

VERTICAL DIFFERENTATION OF TIEN-SHAN TORRENTS, BASED ON THE DISTRIBUTION OF CHARACTERISTICS OF WATER INSECTS, (IN RUSSIAN),
Akademiya Nauk SSR, Leningrad. Zoologicheskii Institut.
K. A. Brodskii, and E. O. Omorov.
Gidrobiol Zh. Vol 9 No 2 p 40-51, 1973. Illus. (English summary).
Identifiers: Ameletus-Alexandrae, Asioreas-Nivia, Asiores-Tianschanica, Asiores-Turkestanica, Blepharocera-Asiatica, *Distribution patterns, Ecological factors, Iron-Montanus, Iron-Rheophilus, Rhithrogena-Tianschanica, Tianschanella-Monstrudsa, *USSR(Tien-Shan), *Aquatic insects.

An ecological-faunistic vertical differentiation of the mountain torrents in Tien-Shan (USSR) is presented. It is based on the occurrence of guide water insects (Ephemeroptera, Trichoptera and Diptera-Blepharoceridae). Two torrents in N and S Tien-Shan were subjected to a detail study; more than 60 were studied in general. The scheme is of rather universal significance and may be successively applied to Karakorum, Hindu-Kush and Himalaya mountain countries. Due to their faunas, the following zones are distinguished within Tien-Shan range: zone of glacier springs, zone of upper, middle and lower flow currents. Comparisons with schemes for Europe and North America show that Tien-Shan differs from them in specific peculiarities, making it possible to distinguish this distinct type of torrent for mountain countries of Asia. The most characteristic water insect guide species are endemics for Tien-Shan, Pamirs and adjoining mountain regions (Iron mountanus, I. rheophilus, Rhithrogena tianschanica, Ameletus alexandrae, Tianschanella monstruosa, Blepharocera asiatica, Asioreas nivia, A. tianschanica, A. turkestanica, etc.).--Copyright 1973, Biological Abstracts, Inc.

LABORATORY SIMULATION OF RAINFALL EROSIVITY FOR GULLY FORMATION STUDY,
Kentucky Univ., Lexington. Water Resources Research Inst.
T. Y. Kao.
Available from the National Technical Information Service as PB-232 999; $3.75 in paper copy, $1.45 in microfiche. Research Report No 73, May 1974. 61 p, 23 fig, 4 tab, 21 ref. OWRR A-037-KY(1). 14-31-0001-3517 and 14-31-0001-3817.

Descriptors: *Simulated rainfall, *Gully erosion, *Rainfall simulators, *Soil erosion, Kinetics, Energy, Simulation analysis.
Identifiers: Water drops, Momentum, Erosivity index.

The objective was to develop a rainfall simulator, which imparts to the laboratory rainfall the more important characteristics of natural rainfall such as intensity, drop spectrum, kinetic energy, and momentum at impact, for using in soil erosion research with better results. In developing this simulator the better features of the basic types of earlier simulators, drip and nozzle, have been incorporated into this single design. The simulator developed in this study consists of a number of individual box modules placed in a rectangular pattern to form a single unit. Each module has a grid of capillary holes with cone shaped exits drilled through the bottom plate. The modules were mounted so that their bottom plates form the ceiling of a pressurized room. This provides a hydrostatic pressure differential between the bottom plate and the water surface in each module, such that water will not leak through the holes during the nonoperating state. When pressure pulses are applied to the water surface in each module, water drops are ejected with an initial velocity so that a terminal velocity corresponding to a natural rain drop can be attained without requiring excessive height of fall. The test results indicated that this simulator provides good simulation of the natural rainfall erosivity. (Grieves-Kentucky)

SEDIMENT DISCHARGE IN THE TRINITY RIVER BASIN, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
J. M. Knott.
Water-Resources Investigations 49-73, April 1974. 56 p, 17 fig, 8 tab, 29 ref.

Descriptors: *Sediment discharge, *Sediment transport, *California, Bed load, Suspended load, Sediment yield, Floods, Channel morphology.
Identifiers: *Trinity River basin(Calif).

Long-term total-sediment discharge of the Trinity River, California, and selected tributaries is estimated. Water-discharge data for the period 1912-70 and sediment data collected between 1955 and 1970 were used to evaluate trends and relations between sediment discharge (suspended and bedload) and water discharge. The hydraulic and sediment-transport characteristics of many of the streams in the basin were significantly altered by the December 1964 flood. The depth and velocity of streams changed drastically; for equal magnitudes of streamflow, suspended-sediment discharges after the 1964 flood were several times larger than before the flood. The long-term average annual sediment discharge of the Trinity River near Hoopa is estimated to be 3,120,000 tons. The percentage of clay, silt, and sand or coarser material at this station is estimated to be 20, 32, and 48 percent. Bedload discharge is estimated to be 19 percent of the total-sediment discharge. CHEMISTRY IN THE EXPLORATION AND EXPLOITATION OF HYDROTHERMAL SYSTEMS,
Department of Scientific and Industrial Research, Wellington (New Zealand). Chemistry Div.
W. A. J. Mahon.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1310-1322, 1973. 3 fig, 2 tab, 17 ref.

Descriptors: *Geothermal studies, *Hydrothermal studies, *Geochemistry, *Water chemistry, Exploration, Heat flow, Thermal water, Mineral water, Boreholes, Thermal springs, Sampling.
Identifiers: *Borehole geochemistry, New Zealand, Geothermal power.

Geochemistry plays an important role in the investigation of hydrothermal systems. Experimental information on the geochemistry of individual elements in high temperature environments, and thermodynamic data for solution equilibria and gas solubilities has enabled detailed interpretations to be made of natural hot water and steam compositions. The lateral extent and chemical uniformity of the deep system can often be judged, and zones of high rock permeability connecting the aquifer at depth to the surface outlined. Minimum estimates of the deep water temperature may be made from the concentration of constituents such as silica, magnesium, and fluoride, and from the ratio of sodium to potassium in the spring waters. The tendency for deposition of minerals, particularly calcite, in the deep aquifer during exploitation, can sometimes be assessed from the carbon dioxide and ion concentrations in the surface flows. Information on rock types in the deep system may be obtained from the surface water chemistry. The chemistry of fluids discharged from drillholes during exploration and production drilling provides information on the temperature of the water supplying the drillholes, the migration of fluids and the distribution of steam and water in the system, changes in temperatures and pressures in the aquifer during exploitation, and the possibility of minerals depositing. Examples are given of interpretations of this type from the New Zealand hydrothermal areas of Wairakei, Broadlands, Waiotapu, Orakeikorako, and Ngawha. (See also W74-08973) (Knapp-USGS)

In: Proceedings of the United Nations Sumposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1344-1354, 1973. 7 fig, 1 tab, 45 ref.

Descriptors: *Sampling, *Geochemistry, *Water chemistry, *Thermal water, *Hydrothermal studies, Gases, Geothermal studies, Water analysis, Volcanoes, Radioisotopes.
Identifiers: *Hydrothermal gases, New Zealand, Geothermal power.

A knowledge of the composition of the gas phase associated with the various surface emanations of volcanic and geothermal systems forms an essential part of the study of these systems. Gases play a major role in eruptive phenomena, such as lava fountains and volcanic explosions, and may be useful in predicting eruptions. The interpretation of the composition of gases emitted from fumaroles, hot springs and drillholes in a geothermal field gives a better understanding of the underlying hot water aquifer. A survey of the literature since the beginning of this century shows that five basic methods have been employed for taking gas samples: displacement of air from the sample container, displacement of water or mercury, vacuum tubes or flasks, condensation and absorption. Specific examples are given of the application of these methods either singly or incombination. The advantages and disadvantages of these techniques are discussed, particularly with respect to their success in meeting requirements for the collection of a gas sample. Specific examples of methods used for the analysis of gas samples are discussed. The techniques include absorption methods, wet chemical methods both titrimetric and gravimetric, and instrumental methods (spectroscopy, mass spectrometry and gas chromatography). Possible ways to improve collecting techniques are discussed and the possible application of some more recent instrumental methods of analysis are suggested. (See also W74-08973) (Knapp-USGS)

INTERPRETATION OF GAS COMPOSITIONS FROM THE WAIRAKEI FIELD OVER 10 YEARS,
Department of Scientific and Industrial Research, Taupo (New Zealand). Chemistry Div.
R. B. Glover.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1355-1366, 1973. 9 fig, 4 tab, 13 ref.

Descriptors: *Sampling, *Geochemistry, *Water chemistry, *Thermal water, *Hydrothermal studies, Gases, Geothermal studies, Water analysis, Volcanoes, Radioisotopes.
Identifiers: *Hydrothermal gases, *New Zealand, Geothermal power.

From 1959 to 1969 15 systematic surveys of the carbon dioxide and hydrogen sulphide content of the Wairakei geothermal drillhole discharges were made. Gas solubility data were used to calculate theoretical curves relating the percentage steam separation from the original water to the carbon dioxide content, hydrogen sulphide content, and the carbon dioxide/hydrogen sulphide ratio in both the separated steam and the residual water. From a comparison of the actual gas concentrations of drillhole discharges with the theoretical curves, it was possible to deduce the underground separation and mixing processes taking place and to follow changes in downhole pressures and temperatures. Either nonequilibrium gas and steam separation takes place or steam separation occurs in several stages during the movement of the geothermal fluid. Evidence from downhole temperatures measured under nondischarging conditions, the supply water temperatures during discharge calculated from silica concentrations, and enthalpy data suggest that many drillholes are discharging water which has lost steam at some distance from the drillholes. HIGH ACTIVITY HYDROTHERMAL ZONES DETECTED BY NA/K, CERRO PRIETO, MEXICO,
Comision Federal de Electricidad, Mexico City. Geothermochemical Research.
S. Mercado.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1367-1376, 1973. 10 fig, 1 tab, 20 ref.

Descriptors: *Geothermal studies, *Hydrothermal studies, *Geochemistry, Water chemistry, Exploration, Heat flow, Thermal water, Mineral water, Boreholes, Thermal springs, Sampling, *Mexico.
Identifiers: *Borehole geochemistry, Geothermal power.

The chemical index or molar ratio Na/K is a good indicator of high hydrothermal activity zones in the Cerro Prieto geothermal field, Mexico. Drillholes with a Na/K ratio of 6 have bottom temperatures of 370 deg C and 70 kg/sq cm of pressure at the wellhead, and drillholes with high Na/K proportion (16) have only 160 deg C at the bottom and 3 kg/sq cm of pressure at the wellhead. The Na/K ratio is indicative of the high steam production zones and helps to determine the underground water distribution and migration with acceptable results. (See also W74-08973) (Knapp-USGS)

CHEMICAL STUDIES IN MEXICAN GEOTHERMAL FIELDS,
Comision Federal de Electricidad, Mexico City Inst. of Investigations of Electrical Industry.
B. R. Molina, and C. J. Banwell.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1377-1391, 1973. 4 fig, 9 tab, 8 ref.

Descriptors: *Geothermal studies, *Hydrothermal studies, *Geochemistry, *Water chemistry, Exploration, Heat flow, Thermal water, Mineral water, Boreholes, Thermal springs, Sampling, *Mexico.
Identifiers: *Borehole Geochemistry, Geothermal power.

Chemical samples have been analyzed from the geothermal fields of Los Humeros, Ixtlan de los Hervores, Los Negritos, Pathe, and Cerro Prieto, all in Mexico. Quantitative analyses for up to 16 principal elements or compounds were made on water samples as well as from selected hot springs, and steam and gas discharges were analyzed for seven gaseous elements and compounds. In Los Humeros, where the manifestations consist only of dry steam vents, water analyses were made on condensate, but in the other areas the analyses were made on samples from hot springs, geysers, and mud pools. In Ixtlan de los Hervores, water samples were also available from two test drillholes. Samples were taken from a large enough number of points to permit isochemical contours of several kinds to be drawn in each area, and the resulting patterns show a striking correlation with certain of the geological and geophysical data. These correlations have been of considerable value for siting prospecting drillholes in the Ixtlan area. A number of the more important chemical relationships were plotted in the conventional type of triangle or other form of diagram and compared with similar data from fields in other parts of the world. W74-09019

GEOCHEMISTRY OF THE AHUACHAPAN THERMAL AREA, EL SALVADOR, CENTRAL AMERICA,
Iceland Univ., Reykjavik. Science Inst.
G. E. Sigvaldason, and G. Cuellar.
In: Proceedings of the United Nations Sumposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1392-1399, 1973. 1 fig, 4 tab, 11 ref.

Descriptors: *Geothermal studies, *Hydrothermal studies, *Geochemistry, *Water chemistry, Exploration, Heat flow, Thermal water, Mineral water, Boreholes, Thermal springs, Sampling.
Identifiers: *El Salvador.

Geothermal activity in El Salvador consists of two types of thermal areas: Low temperature areas with hot spring activity, and high temperature areas also displaying fumarolic activity. The high temperature area at Ahuachapan is being studied at present, and deep drilling has started. Two distinct chemical types of thermal water exist in the area: a shallow aquifer with a moderate concentration of dissolved solids (temp. 120-150 deg C) and a deep aquifer with saline water (temp at least 228 deg C). The shallow aquifer probably represents a normal groundwater body which is heated by escaping steam and water from the lower aquifer, and by conduction. Deuterium analyses of both types of thermal water show similar values to those found in cold water springs in the area, indicating common meteoric origin. (See also W74-08973) (Knapp-USGS)
W74-09020

A NOTE ON THE HOT SPRINGS OF ECUADOR,
Proyecto Minero, Quito (Ecuador).
A. De Grys, J. Vera, and P. Goossens.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1400-1404, 1973. 1 fig, 3 tab, 18 ref.

Descriptors: *Geothermal studies, *Hydrothermal studies, *Geochemistry, *Water chemistry, Exploration, Heat flow, Thermal water, Mineral waters, Boreholes, Thermal springs, Sampling.
Identifiers: *Ecuador.

Waters from several Ecuadorian hot springs were analyzed. The springs may be divided into three groups: (a) coastal springs; (b) a northern group of springs which are in the vicinity of volcanoes; and (c) a southern group of springs associated with travertine deposits, situated in an area of Plio-Pleistocene volcanism. The last group has waters with high concentrations of Ca HCO3, Na, and Cl, besides adnormal amounts of Li, As, and B; the SO4 content is low. There may be a relationship between these waters and the numerous epithermal deposits in the area. (See also W74-08973) (Knapp-USGS)
W74-09021

DEUTERIUM AND CHLORIDE IN GEOTHERMAL STUDIES IN ICELAND,
Iceland Univ., Reykjavik. Science Inst.
B. Arnason, and J. Tomasson.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1405-1415, 1973. 6 fig, 6 tab, 12 ref.

Descriptors: *Thermal water, *Hydrothermal studies, *Deuterium, *Chlorides, Groundwater

movement, Hydrogeology, Water chemistry, Tracers.
Identifiers: *Iceland, Geothermal power.

In Iceland, deuterium measurements are useful for distinguishing between different water systems, even in the same geothermal field. One of the areas is fed by at least three hot-water systems of different origin. Two other areas are fed by two hotwater systems each. Deuterium measurements used together with chemical analyses of the water may give valuable information about the chemical composition of the geological formations through which the groundwater flows and about the chemical reactions taking place. In some cases the groundwater, initially meteoric, has passed through chloride-rich formations in the ground whereby it acquires considerable amounts of chloride. In one place the hot-water originates in the ocean. The possibility that the deuterium concentration of the hot-water may change during its passage underground is discussed; on the basis of data available at present it is concluded that such a change does not take place. In one of the areas the hot groundwater contains less deuterium than the lowest yearly average value of precipitation found in Iceland at present. The explanation offered for this is that this water dates from a time when the climate was considerably colder than it is today. (See also W74-08973) (Knapp-USGS)

CHEMICAL PROSPECTING OF STEAM AND HOT WATER IN THE MATSUKAWA GEOTHERMAL AREA,
Japan Metals and Chemicals Co., Ltd., Morioka.
Y. Fujii, and T. Akeno.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1416-1421, 1973. 3 fig, 6 tab.

Descriptors: *Geothermal studies, *Hydrothermal studies, *Geochemistry, *Water chemistry, Exploration, Heat flow, Thermal water, Mineral water, Boreholes, Thermal springs, Sampling.
Identifiers: *Geothermal prospecting, *Japan, Geothermal power.

In the Matsukawa geothermal area, Japan, the first experimental well, AR-1, was drilled in 1960, and the sixth production well, No. 6, was completed January, 1969. The steam of Matsukawa is classified into three types according to the physical characteristics such as the degree of moisture and existence of hot water. Chemically, it is classified in two types according to the composition of the steam. The shallower wells tend to contain more hydrogen sulfide. Drilling a new well did not cause any decrease of the steam amount in former wells. With regard to the discharge of hot water, however, interference was observed between No 1 and No 4 wells, and No 1 and No 5 wells. (See also W74-08973) (Knapp-USGS)
W74-09023

GEOCHEMISTRY OF THE WATERS DISCHARGED FROM DRILLHOLES IN THE OTAKE AND HATCHOBARU AREAS,
Kyushu Univ., Beppu(Japan). Inst. of Balneotherapeutical Research I.
A. Koga.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1422-1425, 1973. 3 tab.

Descriptors: *Geothermal studies, *Hydrothermal studies, *Geochemistry, *Water chemistry, Exploration, Heat flow, Thermal water, Mineral water, Boreholes, Thermal springs, Sampling.
Identifiers: *Geochemical prospecting, *Japan, Geothermal power.

The waters discharged from drillholes at Otake and Hatchobaru geothermal areas in Japan are slightly alkaline and contain sodium and potassium chlorides as major constituents. Otake and Hatchobaru waters may be somewhat diluted with shallow waters rich in sulphate and bicarbonate. The water temperatures calculated were between 195 deg C and 240 deg C at Otake, and 300 deg C at Hatchobaru. In general, the deep waters at Otake and Hatchobaru, especially Hatchobaru water, may be considered typical of geothermal areas in Japan. (See also W74-08973) (Knapp-USGS)

In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1636-1639, 1973. 2 fig, 5 ref.

Descriptors: *Saline waters, *Hydrothermal studies, *Thermal water, Salts, Bromine, Chlorine, Iodine, Potassium, Lithium, Rubidium, Groundwater, Brines, Mineral water.
Identifiers: *USSR.

Thermal waters have become the focus of attention in recent years as a source of mineral reserves and energy, both in the Soviet Union and abroad. Chloride waters, rich in salts of bromine, potassium, lithium, and strontium are formed in halogen formations found throughout the sedimentary sequence. Concentration of bromine, strontium, lithium and rubidium increases with depth of occurrence of thermal waters and rising mineralization, while boron and iodine show a reverse dependence; their concentration goes down with depth and rising mineralization. EXPLORATION OF THE REYKIANES THERMAL BRINE AREA,
National Energy Authority, Reykjavik (Iceland).
S. Bjornsson, S. Arnorsson, and J. Tomasson.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1640-1650, 1973. 8 fig, 4 tab, 7 ref.

Descriptors: *Brines, *Water chemistry, *Thermal water, Mineral water, Chlorides, Sodium, Potassium, Calcium, Hydrogeology, Hydrothermal studies.
Identifiers: *Iceland.

The Reykjanes thermal brine area is located in the extreme southwest of Iceland. This area is unique among thermal areas for its fluid composition. In the reservoir where temperatures are between 250 and 290 deg C, the brine has the same salinity as seawater. However, the concentrations of some ions are different and can be explained by relatively simple interaction of seawater with the rock. Due to its temperature and composition, feasibility studies indicate that the brine could be exploited economically for the production of NaCl, KCl, CaCl2, and possibly other components. Aquifers are abundant in the basalt formation. It is therefore recommended that production wells penetrate to depths of about 2,600 m to withdraw brine within this permeable formation so as to ensure highest mass flow and minimize risk of cold seawater intrusion. W74-09039

CONTRIBUTION TO THE MINERAL EXTRACTION FROM SUPERSATURATED GEOTHERMAL BRINES, SALTON SEA AREA, CALIFORNIA,
H. H. Werner.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1651-1655, 1973. 2 fig, 4 tab.

Descriptors: *Hydrothermal studies, *Brines, *California, *Water chemistry, Mineral water, Thermal water, Zinc, Lead, Tin, Titanium, Copper, Silver, Gold, Beryllium, Scaling, Thermal power.
Identifiers: *Geothermal power, *Salton Sea(Cal).

Mud volcanoes, pumicite domes, and warm thermal springs are characteristic for the Salton Sea geothermal area in the northern part of the Imperial Valley, California. The recovery of Zn, Pb, Sn, Ti, Cu, Ag, Au and Be could amount to about $264,670 per well per year. In some cases the value of the minerals can supersede the value derived from the sale of the power and will make the complete project viable. (See also W74-08973) (Knapp-USGS)

Identifiers: *USSR, *Dniester River, *Dnieper River, *Danube River.

The possibility is examined of applying the systems approach to solution of the problem of transformation of natural conditions of the river-estuary-sea system under influence of human activity. The systems concept of a river-estuary-sea ecosystem can eventually be used to simulate processes occurring at the level of interaction of subsystems and to qualitatively evaluate the structural relations. The effects of man on natural conditions of the ecosystem are investigated, using, as an example, the Dniester River basin and the Dniester estuary. At the present stage of development of productive resources in the Southern Economic Region, the sole sources of water are runoff of the Danube (196 cu km), Dniester (8 cu km), Dnieper (51 cu km), and freshwaters of major open estuaries of the Dniester (volume--0.7 cu km) and

Dnieper (volume--3 cu km). Location of estuaries and estuarine lagoons in the northwestern part of the Black Sea is mapped. (Josefson-USGS)

Marine Biology, Vol 9, p 65-70, 1971.

Descriptors: *Copepods, Life Cycles, Labortory Animals, Phytoplankton, Algae, *Fertility, Productivity.
Identifiers: *France(Gulf of Marseilles), *Acartia clausi, *Temora stylifera, *Centropages typicus.

Egg-laying of 3 common copepod species from the Gulf of Marseilles (Centropages typicus Kroyer, Acartia clausi Giesbrecht, Temora stylifera Dana) has been studied under various trophic conditions, at different periods of the year. The role of phytoplankton abundance in the induction and importance of egg-laying is indicated. The specific quality of the algal suspension used for feeding affected also fertility. A seasonal variation in the importance of egg-laying is established. Some observations are made on egg deposition and development.

Texas Univ., Austin. Bureau of Economic Geology.
R. A. Morton, and A. C. Donaldson.
Sedimentary Geology, Vol 10, No 4, p 285-299, December 1973. 7 fig, 21 ref.

Descriptors: *Sedimentation, *Shores, *Tidal effects, *Littoral drift, Deltas, *Virginia, Beaches, Barrier islands, Geomorphology.
Identifiers: *Wachapreague(Va).

Major inlets in the vicinity of Wachapreague, Virginia have been relatively stable throughout Holocene time; they appear to be located where Pleistocene stream valleys previously existed. Holocene barrier islands apparently developed on drainage divide areas following post-Wisconsin transgression of the sea. The initial phase of tidal delta development was characterized by vertically accreting, fan-shaped, inlet-mouth bars; tidal channels stabilized after bar crests had shoaled sufficiently for marsh to form. With landward progradation across the lagoon, sand-rich deposits graded laterally away from the inlets and vertically into clayey sand and silty clay of the tidal flat bay and marsh environments. Ebb inlet-mouth bars developed asymmetrically southward in response to littoral drift. Flood tidal deltas also built preferentially toward the south as indicated by: (1) sand distribution of the inlet-mouth bar complex; and (2) greater development of marsh south of the inlets. Identifiers: *USSR, *Mineralization.

Desalination is discussed in connection with the use of highly mineralized groundwater for water supply. Estimates are made of groundwater resources for the United States, Australia, and the Soviet Union. Desalination methods most adaptable for processing groundwater are described, and data are given on Soviet and foreign desalting plants in operation and on their basic economic indices. Maps show distribution of saline groundwater in the United States, of groundwater of varying salinity on the Australian continent, and of brackish and saline groundwater in the USSR. (Josefson-USGS)

SEAWATER DESALINATION WITH PBI HOLLOW FIBER REVERSE OSMOSIS MEMBRANES,
Celanese Research Co., Summit, N.J.
H. J. Davis, J. S. Soehngen, and F. S. Model.
Available from the National Technical Information Service as PB-230 693/AS, $6.25 in paper copy, $1.45 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-937, March 1974. 58 p, 18 fig, 17 tab, 5 ref. OSW Contract 14-30-3199.

Descriptors: *Desalination, *Membranes, *Reverse osmosis, Permeability, Salt rejection, *Annealing, Pretreatment, Chlorination, Sea water.
Identifiers: *Hollow fibers(PBI), Fiber spinning, In-line annealing.

Laboratory evaluations have shown that the reverse osmosis properties of PBI hollow fiber membranes are adequate for a single-pass desalination of seawater at an operating pressure of 1,000 psi. Against 3.5% (35,000 ppm) sodium chloride feed at 75F, product water with 250 to 350 ppm sodium chloride was obtained in long-term testing; similarly, against 3.6% (36,000 ppm) sea salt solution, product water with 250-350 ppm total dissolved solids was obtained -- well within limits commonly accepted for potable water. In field evaluation tests against chlorinated sea water at 1,000 psi and at about 55F, total dissolved solids

concentrations as low as 108 to 174 ppm were reported. High rejection values 98.8% to 99.4% were obtained and continued at these high levels over the long-term test periods. Product water flux ranged from 0.6 to 1.1 gfd in laboratory long-term testing at 75F and from 0.2 to 0.5 gfd in the field evaluation tests at 55F. (OSW)

APPLICATION OF EXTERNALLY WOUND TUBULAR MEMBRANE SYSTEMS FOR SEA WATER DESALINATION,
Universal Water Corp., San Diego, Calif.
Serop Manjikian.
Available from the National Technical Information Service as PB-229 730/AS, $7.75 in paper copy, $1.45 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-929, March 1974. 86 p, 28 fig, 9 tab. OSW Contract 14-30-3107.

Descriptors: *Desalination, Sea water, *Reverse osmosis, *Membrane processes, Pilot plants, Corrosion, Membranes.
Identifiers: Cellulose acetate membranes, Diacetate-triacetate membranes, Helical elements, Nylon-dacron backing materials.

The primary objective was the modification and adaptation of the externally wound tubular membrane element unit for use in high pressure sea water desalination. Various prototype modules were constructed and tested. Modular components, subassemblies and various materials of construction were evaluated in prototype modules with respect to their mechanical properties, corrosion resistance, and reliability when operated with sea water. The results indicated that the fabrication of cellulosic membrane systems for sea water is technologically and economically practical when the desired goal is 1000 ppm total dissolved solids or less and when operated at 1000 psi at a 20% recovery. With the determination of helical systems sea water operating parameters and the optimization of the externally wound tubular membrane element unit for high pressure applications, a bench scale pilot unit was designed and built for long term evaluation using sea water. Descriptors: *Geothermal studies, *Hydrothermal studies, *Mexico, *Water supply, Water treatment, Saline waters, Potable water, *Pilot plants.
Identifiers: Geothermal power.

At the Cerro Prieto geothermal field, a pilot plant is used for production of freshwater using the endogenous steam. The cost of freshwater obtained is 1.39 Mexican pesos per cu/m. The cost of freshwater obtained competes with the cost of drinking bottled water, which in Mexicali City is between 1.50 to 2.00 Mexican pesos for a 20 liter flask. (See also W74-08973) (Knapp-USGS)

DESALTING THE SEAS: A STEP TOWARD WORLD PEACE,
R. Schuessler.
Oceans, Vol 4, No 5, p 64-69, September-October 1971. 4 photo.

Descriptors: *Adoption of practices, *Desalination plants, Distillation, Membrane processes, Water yield, Desalination wastes, Fertilizers, Nuclear energy, Cost analysis.

Like outer space in the 1960's, the oceans can now be regarded as the greatest challenge to man's pioneering spirit and engineering skill, and the 1970's could become the decade of the deep, the age of desalting plants. While steps have been taken toward that goal, much more must be done in both building plants and developing cheaper methods of desalting water if the needs of modern society are to be met. Studies show that 41% of water systems deliver water of poor quality. Costs are relatively high at present but certain technology will lower them, and then as a diplomatic means of communication, the U.S. could help the entire world solve their water crisis, preventing droughts and famines. For all the progress today, desalination experts have but scratched the surface in how best to desalt the seas. The two best methods used today are distillation and the membrane method. Some of the collateral aspects of desalination include production of fertilizer, helping to prevent environmental pollution and waste water management. The most promising new method is one that involves the use of nuclear energy in a dual-purpose plant which would power steam turbines to generate electricity and utilize the exhaust steam to evaporate and condense seawater. MULTI-STAGE FLASH DISTILLATION PLANT,
Industrial Science and Technology Agency, Tokyo (Japan). (Assignee)
K. Sato, K. Kamiyama, and K. Tahara.
U. S. Patent No 3,801,471, 3 p, 4 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 921, No 1, p 297, April 2, 1974.

Descriptors: *Patents, *Desalination, *Distillation, *Flash distillation, *Evaporators, *Water treatment, *Potable water, Sea Water.

A multi-stage flash evaporator is capable of producing fresh water in high yield by approximating the adiabatic evaporation process to the state of theoretical rate production. The apparatus comprises in combination, a series of flash evaporator stages connected in horizontal series and each partitioned by a plate. A baffle plate is disposed from an upper surface of each stage and defines an auxiliary flash chamber with a plate along one side of the stage and defines a flash chamber with a plate along the opposite side of the stage. The flash chamber has a demister, a condenser and a product tray disposed at the top. The demister is placed between the baffle plate and the plate at the opposite side of the stage and below the condenser and product tray. A seawater flow path connecting each adjacent pair of flash chambers is provided near its open end on the low-pressure side. (Sinha-OEIS)

PROCESS AND APPARATUS FOR SOLAR DISTILLATION UTILIZING CELLULAR CERAMIC NODULES TO IMPROVE THE EVAPORATION RATE,
Pittsburgh Corning Corp., Pa. (Assignee)
N. T. Castellucci, and N. C. Krouskop.
U. S. Patent No 3,801,474, 6 p, 2 fig, 3 tab, 17 ref; Official Gazette of the United States Patent Office, Vol 921, No 1, p 298, April 2, 1974.

Descriptors: *Patents, *Solar distillation, *Evaporation, *Condensation, *Desalination, *Water quality, Sea water, Potable water, Distillation, Saline water.

A process is described for recovering fresh water from brine or salt water by solar distillation. A quantity of substantially spherical cellular ceramic nodules having an outer textured surface is positioned on the upper surface of a body of sea water within a container. The nodules float on the upper surface of the salt water in a partially submerged condition with the upper exposed surfaces of the nodules above the surface of the water. The upper surfaces of the nodules are wetted by the water and a relatively thin film is formed thereon. The film on the upper surface of the nodules is subjected to elevated temperatures by solar radiation and the water in the thin film evaporates and is continually replaced as a thin film from the body of water. The water vapor condenses on a covering surface over the container and is suitably collected. (Sinha-OEIS)
W74-09179

OBTAINING INCREASED HEAD IN WATER SYSTEMS,
G. D. James.
U.S. Patent No. 3,795,587, 3 p, 4 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 920, No 1, p 160, March 5, 1974.

Descriptors: *Patents, *Water vapor, *Desalination, *Condensation, *Water supply, Water treatment.
Identifiers: *Power generation, Water head.

The method for gaining head in a water supply system in which water vapor is generated includes introducing the water vapor into a vertically extended zone and contacting the vapor with relatively cool water droplets moving through the zone condensing the vapor on the droplets, deflecting the droplets repeatedly upward in the zone and collecting the droplets with the condensate upon deflection to the top of the zone. The method further contemplates generating water vapor for introduction into the zone by subjecting relatively warm water to a reduced pressure. The water is introduced into the lower portion of the zone and is dispersed as droplets upward through the zone. Deflection of the droplets in an upward direction may be accomplished by sweeping the zone repeatedly with angularly disposed surfaces adapted to provide upward deflection of impacting droplets. The deflected droplet may be further deflected upward by impacting on a second superjacent surface. The deflection while always upward may have more or less of a horizontal component which is desirably varied from surface to surface impact. (Sinha-OEIS)

PRECIPITATION AUGMENTATION--PROBLEMS AND PROGRESS,
Texas Tech Univ., Lubbock. Dept. of Geosciences.
D. R. Haragan.
Water Resources Bulletin, Vol 10, No 3, p 547-554, June 1974, 10 ref.

Descriptors: *Weather modification, *Artificial precipitation, Cloud seeding, Reviews, Social aspects, Legal aspects, Water management(Applied).

Weather modification and precipitation management are reviewed. Coordination of efforts and intensification of both laboratory and field research could lead to major advances. Scientific efforts should be coordinated with a program designed to inform and educate the public on the role and potential of artificial precipitation augmentation. In addition, careful consideration must be given to social and legal issues. Environmental impact, land use, economic potential and damage liability are all factors of importance in any comprehensive analysis. Rational solutions to questions in each of these areas are dependent upon the establishment of a sound scientific basis for operational weather modification, which should be the first priority. (Knapp-USGS)

A CLIMATOLOGY OF CUMULUS SEEDING POTENTIAL FOR THE WESTERN UNITED STATES,
Navy Weather Research Facility, Norfolk, Va.
P. R. Lowe, D. C. Schertz, and D. A. Matthews.
Available from NTIS, Springfield, Va. 22151 as AD-769 543 - Price $6.50 printed copy; $1.45 microfiche. Technical Paper No 4-71, February 1971. 78 p, 32 fig, 5 tab, 8 ref. USBR Contract 14-06-D-6989.

Descriptors: *Cloud seeding, *Weather modification, *Simulation analysis, Mathematical models, Probability, Climatology, Synoptic analysis, *Southwest U.S.

For rainfall enhancement through the seeding of cumulus clouds, no large body of information relative to the probable outcome of cloud modification exists. Lacking these data, recourse to mathematical simulation of cloud modification is the only means of estimating the likelihood of outcomes of such activity. The WEARSCHFAC-Penn State, one-dimensional, steady state, cumulus model, needs only a small amount of computer memory, and only very little time for processing atmospheric soundings in numbers sufficient to generate a climatology. The seeding procedure represented by the simulation case wherein all liquid water is converted to ice at -15 deg C shows considerably less potential for rainfall enhancement than the procedure represented by the simulation case for conversion at -8 deg C. In terms of increased absolute volumes of water delivered into watershed areas, larger clouds definitely show significantly more potential than smaller ones. There is no significant trend in the amounts of rainfall inhibition with respect to geography. (Knapp-USGS)

IMPROVEMENT OF TROUT STREAMS IN WISCONSIN BY AUGMENTING LOW FLOWS WITH GROUND WATER,
Geological Survey, Washington, D.C.
R. P. Novitzki.
Available from Sup Doc, GPO, Washington, D C 20402 - Price $0.55. Water-Supply Paper 2017, 1973. 52 p, 26 fig, 3 tab, 45 ref, append.

Descriptors: *Low-flow augmentation, *Water temperature, *Wisconsin, Conjunctive use, Groundwater, Streamflow, Fishing, Trout.
Identifiers: Little Plover River(Wisc), Black Earth Creek(Wisc).

Approximately 2 cubic feet per second of groundwater were introduced to augment low flow in the Little Plover River, Wisconsin in 1968 when natural streamflow ranged from 3 to 4 cubic feet per second. These augmentation flows were retained undiminished through the 2-mile reach of stream monitored. Maximum stream temperatures were reduced as much as 5 deg F at the augmentation site during the test period, although changes became insignificant more than 1 mile downstream. Maximum temperatures might be reduced as much as 10 deg F during critical periods, based on estimates using a stream-temperature model developed as part of the study. Augmentation flows of nearly 2.5 cubic feet per second of groundwater were introduced into the headwater reach of Black Earth Creek from the end of June through mid-October 1969. Augmentation flows were retained through the 8-mile reach of stream. Temperature of the augmentation flow as it entered the stream ranged from 60 deg to 70 deg F during the test period, and minimum stream temperatures were raised 5 deg F or more at the augmentation site, with changes extending from 2 to 3 miles downstream. Augmentation during critical periods could maintain stream temperatures between 40 deg and 70 deg F through most of the study reach. Dissolved oxygen levels were increased by as much as 2 milligrams per liter or more below the augmentation site. During critical periods DO improvement in the problem reach would be somewhat greater. Institute for Applied Research on Natural Resources, Baghdad, Iraq. Technical Bulletin 48, September 1973. 15 p, 4 fig, 6 tab, 4 ref.

Descriptors: *Soil amendments, *Soil texture, *Gypsum, *Planting management, Soil profiles, Organic matter, Alfalfa, Saturation, Lime, Salts, Soil chemistry, Irrigation, Groundwater, Soil water movement, Soil physical properties, Farm wastes.
Identifiers: *Iraq.

A reconnaissance survey in Central Iraq showed that 20 percent of the region is composed of irrigation depression soils with poor structure. The soils exhibit low permeability with puddles and compaction occurring following irrigation. Experiments were conducted using gypsum and farm manure as soil amendments, and a combination of farm manure and deep plowing was also tried. Wheat and alfalfa were cultivated on these sites. No perceptible change occurred from the gypsum application as a result of a restricted plow depth and consequently restricted rooting depth. Application of farm manure resulted in increases of 11-13 percent in alfalfa yields and 25-31 percent for wheat plots. More drastic increases were believed to be hampered due to restricted plow and rooting depths. On plots that were deep plowed significant increases in yields from both crops were evident. The highest yields resulted from combinations of farm manure and deep plowing. (Mastic-Arizona)

NITROGEN METABOLISM OF STARGRASS AS AFFECTED BY NITROGEN AND SOIL SALINITY,
Department of Agriculture, Watkinsville, Ga.
G. W. Langdale, J. R. Thomas, and T. G. Littleton.
Agronomy Journal, Vol 65, No 3, p 468-470, May-June, 1973. 3 fig, 2 tab, 19 ref.

Descriptors: *Fertility, *Nitrogen, Fertilizers, *Salinity, Nutrient removal, Leaching, Crop response, Saline soils, *Metabolism.

Interactive effects of soil salinity and N fertilizer on stargrass growth and N metabolism were investigated. Nitrogen contents were partitioned to study the effects of substrate salinities on hydrolysis of protein-N and the accumulation nonprotein-N assimilates. Mixed chloride-sulfate solutions of the same ionic ratios and electrical conductivities (EC) of 4.8, 9.6, and 14.4 mmhos/cm were equilibrated with Brennan fine sandy loam soil, after which N was applied in a factorial arrangement at rates of 0, 67, 133, and 200 mg/kg of soil. Nitrogen fertilizer interacted significantly with soil salinity to stimulate dry matter and protein-N yields at the 4.8-mmhos/cm level. No evidence of a toxic nonprotein-N accumulation in plant tissue was observed even with high N fertilization at this salinity level. The 9.6-mmhos/cm salinity treatment was considerably more deleterious to dry matter than to protein-N production processes. (Skogerboe-Colorado State)

CELL WALL PROPERTIES OF COTTON ROOTS AS INFLUENCED BY CALCIUM AND SALINITY,
Texas A and M Univ. Weslaco Agricultural Research and Extension Center.
C. J. Gerard, and E. Hinojosa
Agronomy Journal, Vol 65, No 4, p 556-560, July-August, 1973. 11 fig, 1 tab, 15 ref.

Descriptors: *Salinity, *Crop response, Calcium, Root development, *Cotton(Field), *Root system, Root zone.

Research was conducted to determine the influences of salinity and Ca uptake on cell wall properties of cotton roots. It was postulated that examination of cell wall properties might give insight on the role of Ca in moderating the influences of salinity and toxic ions on cellular stability and plant growth. Age and Ca are essential to th

development of thick cell walls in the stele. Thick cell walls exhibit high birefringence under polarized light. Salinity reduced Ca uptake and concentration of cotton roots. Xylem and phloem cell walls of cotton roots grown in solutions with sufficient Ca and low salinity thickened and in about 70 hours, exhibited high birefringence. Young cell walls in the pericycle or laterals did not exhibit birefringence. Even at adequate level of Ca, salinity retarded the development of thick cell walls and high birefringence in the stele to about 140 hours. (Skogerboe-Colorado State)

LEACHING REQUIREMENT STUDIES: SENSITIVITY OF ALFALFA TO SALINITY OF IRRIGATION AND DRAINAGE WATERS,
Agricultural Research Service, Riverside, Calif. Salinity Lab.
L. Bernstein, and L. E. Francois.
Soil Science of America Proceedings, Vol 37, No 6, p 931-943, November-December, 1973. 4 fig, 10 tab, 17 ref.

Descriptors: *Salinity, *Salt balance, *Crop response, *Leaching, *Alfalfa, Lysimeters, Irrigation practices, Sodium, *Drainage engineering.

Alfalfa was grown in 0.6 by 1.5 m greenhouse lysimeters and irrigated with two waters of EC 1 and 2 mmho/cm prepared by adding equivalent amounts of NaCl and CaC12 to a 0.4 mmho/cm tap water. Yields showed relatively little effect of leaching fraction (LF) within the limits consistent with steady-state salt balance for suction-drained lysimeters but decreased 26% at the lowest LF for gravity-drained lysimeters. Yields with the 2 mmho/cm irrigation water treatments were consistently about 10% less than those with the 1 mmho/cm water. Cessation of leaching or reduction of LF to levels requiring drainage water salinities for salt balance at steady state to exceed 35 mmho/cm, the maximum salinity achievable by alfalfa roots, eventually reduced yields. Yields were significantly higher when leaching was done every third or sixth irrigation than in every irrigation while maintaining the same average LF of 1/32 and 1/16 for the 1 and 2 mmho/cm irrigation waters, respectively. (Skogerboe-Colorado State)

GROWTH, MINERAL COMPOSITION, AND SEED OIL OF SESAME (SESAMUM INDICUM L.) AS AFFECTED BY NACL,
California Univ., Riverside. Dept. of Soil Science and Agricultural Engineering.
A. H. Yousif, F. T. Bingham, and D. M. Yermanos.
Soil Science Society of America Proceedings, Vol 36, No 3, p 450-453, May-June, 1972. 2 fig, 4 tab, 10 ref.

Descriptors: *Salinity, *Crop response, Sodium, Chlorides, Seeds, *Sodium chloride, *Oilseed crops, *Growth, *Mineralogy.
Identifiers: *Sesame.

The tolerance of sesame to NaCl salinity was studied first during germination, and later during plant growth up to maturity. Germination was conducted in the laboratory at 25C. Sesame plants were tested for response to salinity using nutrient solution cultures with sodium chloride added when test plants were approximately 10 cm tall. Experiments were continued until mature seed pod formation. The data showed a high tolerance during germination but sensitivity at later growth stages. (Skogerboe-Colorado State)

PROCEDURAL PROBLEMS IN PROJECTED PLANNING OF WATER CONSUMPTION AND DIVERSION BY INDUSTRY IN THE USSR (METODICHESKIYE VOPROSY RASCHETA VODOPOTREBLENIYA I VODOOTVEDENIYA V PROMYSHLENNOSTI SSSR NA PERSPEKTIVU),
Akademiya Nauk SSSR, Moscow. Institut Vodnykh Problem.
B. G. Blagoverov.
Vodnyye Resursy, No 4, p 37-42, 1973.

Descriptors: *Water utilization, *Diversion, *Water requirements, *Industrial production, *Future planning(Projected), Human population, Urbanization.
Identifiers: *USSR.

Major water users in the Soviet national economy are agriculture (irrigation) and industry (including thermal powerplants). In 1970 the discharge of freshwater in all branches of Soviet industry was about 90 cu km or about 40% of total water intake from sources. Approximately 10% of water presently used by industry cannot be recovered. Diversion of flow reaches more than 80 cu km a year. Almost 90% of the water returned by industrial enterprises and thermal powerplants is diverted in either a partially treated or totally untreated form. Techniques are presented for calculating industrial water requirements for the USSR. For projected planning, data are needed on volume of production by types of industry within economic regions and on projected water consumption rates. Water consumption and diversion data obtained from economic regions should be examined in relation to river basins. In the absence of sufficient data, water distribution should be based on projections of urban population. As much as 90%-95% of water consumed and diverted in the Volga Economic Region should be transferred to the Volga River, 4%-8% to the Don River (part of the Penza, Saratov, and Volgograd Oblasts) and 1%-2% to the Ural River (part of the Bashkir ASSR). COTTON LEAF TEMPERATURES AS RELATED TO SOIL WATER DEPLETION AND METEOROLOGICAL FACTORS,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
W. L. Ehrler.
Agronomy Journal, Vol 65, p 404-409, May-June 1973. 4 fig, 3 tab, 9 ref.

Descriptors: *Cotton, *Air temperature, *Rates of application, *Moisture deficit, *Soil-water-plant relationships, Leaves, Irrigation practices, Saturation, gravimetric analysis, potentiometers, stomata, Vapor pressure, Evaporation, Regression analysis.

The feasibility of using air temperature difference and moderate soil water depletion relationships as a possible guide for irrigation scheduling of cotton was investigated. Data were gathered during six irrigation cycles during two summers. The experimental plots were irrigated on a schedule to obtain a high lint yield. Results showed it was possible to measure a rise in air temperature difference accompanying a moderate soil water depletion, but the saturation deficit of the air must also be known. Precautions must be taken to make accurate measurements of leaf temperature, air temperature, and vapor pressure through the irrigation cycle. Attention must be paid to species involved. Use of this method is restricted to predominantly sunny regions, but further development is necessary to obtain values predicting maximum yields. (Mastic-Arizona)

AGRICULTURAL DEMAND FOR WATER IN THE PECOS RIVER BASIN: AN ADDENDUM,
New Mexico Univ., Albuquerque. Dept. of Economics.
M. Gisser.
Water Resources Research, Vol 9, No 5, p 1429-1432, October 1973. 4 tab, 2 ref.

Descriptors: *Water demand, Imported water, *Groundwater recharge, *Phreatophytes, Aquifers, Salinity, Evaporation, Pumping, Irrigation, New Mexico, Texas.
Identifiers: *Pecos River(N.Mex.-Tex).

This addendum explores some questions proposed in two earlier studies on importing water to meet agricultural demand in the Pecos River Basin. The first assumed that the water would be stored on the ground if not immediately used. In the second the assumption was that the imported water would be recharged artifically to the aquifer for storage and to reduce high evaporation rates. Some problems posed by earlier studies are defined in this report, particularly salinity constraints and the possibility of reducing natural discharge of water by lowering the evaporation rate of salt cedars and other solutions such as irrigation systems. However, alternative technologies are not sufficiently developed to allow complete evaluation. (See also W70-10055, and W73-04277) (Mastic-Arizona)
W74-08756

AIR TEMPERATURE AND VAPOR PRESSURE CHANGES CAUSED BY SPINKLER IRRIGATION,
Agricultural Research Service, Kimberly, Idaho. Snake River Conservation Research Center.
R. A. Kohl, and J. L. Wright.
Agronomy Journal, Vol 66, p 85-88, January-February 1974. 2 fig, 2 tab, 14 ref.

Descriptors: *Evaporation, *Air temperature, *Humidity, *Vapor pressure, *Sprinkler irrigation, Evaportranspiration, Solar radiation, Wind velocity.

Evaporation from a sprinkler irrigation system was investigated to determine whether air temperature and vapor and vapor pressure downwind were changed enough to offset plant growth and water use. Wet-bulb and dry-bulb temperatures were measured along with wind speed and direction. As a result of spray evaporation, air temperature was reduced less than 1 degree C and vapor pressure in the air was increased less than 0.8 mb. The effects are considered insignificant when compared to the influence of an actively transpiring crop; and compared with diurnal and cyclonic temperature changes, the sprinkler effects are very small. The amount of change in air temperature and humidity is not likely to produce any significant change in plant growth or evaporation losses of water. (Mastic-Arizona)

COMPARATIVE STUDY ON THE INTERACTIVE EFFECT OF QUALITIES OF IRRIGATION WATER AND FERTILIZER LEVELS ON THE YIELD OF WHEAT GROWN ON DIFFERENT SOILS,
Udaipur Univ. (India). Coll. of Agriculture.
P. Lal, and K. S. Singh.
Z. Acker-Pflanzenbau, Vol 136, No 4, p 302-308, 1972.
Identifiers: Comparative studies, Electrical conductivity, *Fertilizers, *Irrigation water, *Sodium adsorption ratio, Soils, *Wheat, Crop production.

Grain and straw yields decreased with increasing levels of electrical conductivity (EC) or Na adsorption ratio (SAR) of irrigation water, but at every level of EC or SAR of irrigation water, better yields were obtained with the higher dose of fertilizers than with the lower dose. Fertilization tended to offset the adverse effect of higher level of EC or SAR of water. The effect of fertilization decreased as the level of EC and SAR of water increased. Reduction in yields with an increase in salt concentration of irrigation water was small on sandy and loamy sand soils as compared to sandy loam and loam soils.--Copyright 1973, Biological Abstracts, Inc.

INTERACTION EFFECTS OF BORON AND LIME ON BARLEY,
Department of Agriculture, Charlottetown, (Prince Edward Island). Research Station.
U. C. Gupta.
Soil Science Society of America Proceedings, Vol 36, No 2, p 332-334, March-April, 1972. 3 tab, 15 ref.

Descriptors: *Nutrient requirements, *Trace elements, *Boron, *Toxicity, Crop response, *Barley, Salts, Salinity, *Lime.

A greenhouse study involving six levels of B and four levels of lime was conducted on barley. Boron toxicity symptoms occurred at 0.5 to 4.0 ppm applied B, with the most severe symptoms occurring at 4.0 ppm B level at soil pH 5.3. At 0.5 ppm B, no visible symptoms occurred at pH values of 6.3 and 6.8, and at 1.0 ppm B no symptoms occurred at pH 6.8. There was a highly significant soil pH x B interaction, in which high rates of B were more detrimental to kernel yields at lower pH than at high pH values. The highest kernel yields were recorded with 0.25 ppm B at soil pH 5.8. An application of 4.0 ppm B at soil pH 5.3 and 5.8 did not produce any kernels. A range in the B concentration of 1.4 to 9.9 ppm and in Ca/B ratio of 343 to 1,159 in the boat stage tissue (b.s.t.) collected from Prince Edward Island fields indicated a deficiency of B in many soils for growing barley. However, no visible B deficiency symptoms were found either under greenhouse or field conditions. (Skogerboe-Colorado State)

RESPONSE OF SUBIRRIGATED HAY MEADOWS TO THE APPLICATION OF NITROGEN, PHOSPHORUS, AND SULFUR,
Nebraska Univ., Concord. Northeast Station.
G. W. Rehm, W. J. Moline, R. C. Sorensen, and D. F. Burzlaff.
Agronomy Journal, Vol 65, No 4, p 665-668, July-August, 1973. 4 fig, 7 tab, 7 ref.

Descriptors: *Fertilizers, *Nitrogen, *Phosphorus, Fertility, Hay, Yield equations, *Sulfur, *Grasses, Nutrients.

A study was designed to evaluate the effect of five rates of N, P and S on the yield and grass-legume composition of subirrigated meadows. Forage yields were recorded and separations made to determine grass-legume composition. Yields increased linearly with applied N while the response to P was curvilinear. There was no response to S. The percentage of grass in the meadows increased with applied N. Legume percentages increased with added P. Grass yields showed a linear increase with applied N and a curvilinear response to added P. Legume yields decreased linearly at low P rates when high rates of N were applied but increased curvilinearly as P rates were increased. Throughout the study, combinations of N and P produced the highest yields, thus demonstrating the importance of the combination of these two nutrients for maximum production from subirrigated hay meadows. EFFECT OF SUPPLEMENTAL WATER ON BARLEY AND CORN PRODUCTION IN A SUB-HUMID REGION,
Agricultural Research Service, Northern Great Plains Research Center. Mandan, N.D.
J. F. Power, J. J. Bond, W. A. Sellner, and H. M. Olson.
Agronomy Journal, Vol 65, No 3, p 464-467, May-June, 1973. 1 fig, 4 tab, 6 ref.

Descriptors: *Irrigation, *Irrigation practices, *Supplemental irrigation, Irrigation programs, Irrigation effects, *Corn(Field), *Barley.

A 3-year field experiment was conducted on a loam soil in eastern North Dakota to determine the effect of supplemental water, added in various quantities and at different times, on malting barley and corn silage production. Irrigation consisted of (a) none; (b) after previous harvest only (to fill 120-cm profile); (c) 6 cm applied per irrigation as needed during growing season; (d) after previous harvest plus 6 cm at anthesis; (e) after previous harvest plus 6 cm applied as needed during the growing season; and (f) after previous harvest plus 9 to 12 cm applied as needed during the growing season. Water added after harvest was not reflected in soil water content by seeding time the following spring or in increased crop yields, indicating that fall irrigation was of little value. A linear regression existed between total water use and both barley grain and corn silage production, with no distinct differences between the six water treatments evident. (Skogerboe-Colorado State)

DEVELOPMENT OF AUTOMATED SURFACE IRRIGATION,
Department of Agriculture, Lethbridge (Alberta). Research Station.
K. Pohjakas.
Canadian Agricultural Engineering, Vol 14, No 2, p 72-74, December, 1972.

Descriptors: *Irrigation practices, *Irrigation systems, *Automation, Automatic control, Surface irrigation, Furrow irrigation, Border irrigation, Irrigation.

Surface irrigation by manual methods, because of its high labor requirement, is rapidly being replaced by automated sprinkler irrigation. Various gates, valves, dams, and weirs have been developed that, when used, enable a surface irrigation system to function automatically or by remote control. These components must be reliable, inexpensive, and simple to operate. Hardly any of the recently developed components are being manufactured for commercial use. Automated equipment can reduce the labor requirement of the traditional surface irrigation. Further developmental work, field testing, and commercial production of automatic water control devices are necessary to make surface irrigation competitive with other more automatic systems of irrigation. YIELD RESPONSE OF SOYBEAN VARIETIES GROWN AT TWO SOIL MOISTURE STRESS LEVELS,
Ohio Agricultural Research and Development Center, Wooster.
H. J. Mederski, and D. L. Jeffers.
Agronomy Journal, Vol 65, No 3, p 410-412, May-June, 1973. 2 tab, 12 ref.

Descriptors: *Irrigation, *Irrigation practices, *Soil moisture, *Crop response, *Soybeans, Stress, Droughts.

Eight soybean varieties in each of four maturity groups were grown to maturity at optimum and deficient soil moisture conditions to determine differences in varietal response to soil stress. A significant variety by stress level interaction on seed yield was detected among varieties in each of four maturity groups, indicating that the effect of soil moisture stress on yield varied among varieties. Under high moisture stress conditions, the yield of the most stress-resistant varieties was reduced about 20%, while the yield of the least stress-resistant varieties was reduced about 40%. Under conditions of optimum soil moisture, the difference in yield among varieties was large relative to the difference in yield produced under deficient moisture conditions. A low or nonstress soil moisture level permits greater genotypic expression, thereby increasing genotypic variance among varieties. A low soil moisture stress environment appears to be the optimum environment for selecting soybean yield attributes. (Skogerboe-Colorado State)

PIMA COTTON LINT YIELD AS INFLUENCED BY IRRIGATION SCHEDULE, CULTIVAR AND ALTITUDE,
Agricultural Research Service, Phoenix, Ariz.
D. L. Kittock.
Agronomy Journal, Vol 65, No 3, p 498-501, May-June, 1973. 4 fig, 2 tab, 9 ref.

Descriptors: *Irrigation, *Irrigation practices, *Crop response, *Cotton(Field), Water conservation, Yield equations.

Development of heat tolerant cultivars of American Pima cotton made it desirable to re-evaluate irrigation practices for hot climates. To accomplish this, two cultivars and one experimental strain were tested over a period of 6 years at two altitudes and under several irrigation regimes. There were three basic irrigation regimes and several modifications of them. The regime were: wet, irrigate every 7 to 12 days; medium, 14 to 17 days; and dry, 21 to 28 days. Individual irrigations were added in amounts necessary to refill the soil profile. At high altitude, the heat tolerant cultivar, 'Pima S-4', did not differ in water requirement from the non-heat tolerant cultivar, 'Pima S-3'. Both cultivars obtained maximum lint production with a total of 80 cm of water or five post-emergence irrigations. At low altitude, Pima S-4 yielded higher and required more water than Pima S-3. REFLECTANCE, TRANSMITTANCE, AND ABSORPTANCE OF LIGHT BY SUBCELLULAR PARTICLES OF SPINACH (SPINACIA OLERACEA L.) LEAVES,
Agricultural Research Service, Weslaco, Tex.
H. W. Gausman.
Agronomy Journal, Vol 65, No 4, p 551-553, July-August, 1973. 2 fig, 16 ref.

Descriptors: *Photosynthesis, *Reflectance, Chlorophyll, Energy conversion, Plant physiology, *Absorption.
Identifiers: *Spinach.

Subcellular particles of spinach leaves were differentially sedimented and resuspended in a buffered sucrose solution. A spectroreflectometer was used to measure R and transmittance (T) over the 500- to 2,500-nm wavelength interval (WLI) on replicated aliquots of five preparations: buffered sucrose solution; chloroplast preparation; S1, sediment of chloroplast preparation supernatant; S2, sediment of S1 supernatant; and S3, sediment of S2 supernatant. All suspensions of particulates caused less R than the buffered sucrose solution over the 500- to 650-nm WLI. The chloroplast preparation, compared with the buffered sucrose solution, increased R over the 750- to 950-nm WLI. The chloroplast preparation, compared with the buffered sucrose solution, S2, and S3, decreased T over the 500- to 1,250-nm WLI; S1 decreased T over the 500- to 900-nm WLI. A conclusion was reached that subcellular particles in leaves contribute to the R and A of IR light. (Skogerboe-Colorado State)
W74-08809

IONIC BALANCE FOR BARLEY AS INFLUENCED BY P FERTILITY, WATER, AND SOIL TEMPERATURE,
Agricultural Research Service, Northern Great Plains Research Center. Mandan, N. Dak.
R. F. Follett, and G. A. Reichman.
Agronomy Journal, Vol 65, No 3, p 477-482, May-June, 1973. 4 fig, 1 tab, 23 ref.

Descriptors: *Nutrient removal, *Leaching, *Phosphorus, *Barley, Ion transport, Fertility, *Fertilizers, Soil water, Soil temperature.

The relationship between organic anion concentration and yield of spring barley was investigated in a growth room at three levels of P. This relationship was tested at three levels of available soil water (W) and three soil temperatures (T). The concentration of organic anions was determined as the difference between the sum of the meq/kg of inorganic cations and the sum of the meq/kg of inorganic anions. A normal organic anion (C-A) concentration was considered to be that giving optimal growth. In this study, P was more important for obtaining a normal (C-A) than either W or T. Phosphorus increased yields, decreased (C-A) to near normal, and decreased the adverse effects of low W and low T. The large differences in (C-A) between treatments suggests that, under adverse conditions, organic anions may serve as reservoirs of useful metabolites. (Skogerboe-Colorado State)

WATER STRESS RELATIONS OF THE POTATO PLANT UNDER FIELD CONDITIONS,
Agricultural Research Service, Orono, Maine.
E. Epstein, and W. J. Grant.
Agronomy Journal, Vol 65, No 3, p 400-404, May-June, 1973. 9 fig, 15 ref.

Descriptors: *Soil moisture, *Crop response, *Potatoes, Water requirements, Water utilization, Stress, *Maine.

Potatoes grown in northern Maine are often subjected to extensive periods of drought. The objective of this study was to examine the physiological response of potatoes to soil water stress. Relative water content, leaf diffusive resistance, and tuber water potential of two potato varieties were measured under irrigated and nonirrigated conditions. There were pronounced differences in relative water content, leaf diffusive resistance, and tuber water potential as a result of irrigation. Relative water content (RWC) of plant leaves correlated well with soil water potential but poorly with leaf diffusive resistance. The two potato varieties differed in RWC when soil water potential was high. Tuber water potential correlated well with RWC and soil water potential. Similarity between tuber water potential and the RWC data suggested that the potato plant exhibits water stress when the soil water potential drops below-0.25 bar. (Skogerboe-Colorado State)

COTTON LEAF TEMPERATURES AS RELATED TO SOIL WATER DEPLETION AND METEOROLOGICAL FACTORS,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
W. L. Ehrler.
Agronomy Journal, Vol 65, No 3, p 404-409, May-June, 1973. 4 fig, 3 tab, 9 ref.

Descriptors: *Irrigation, *Irrigation practices, *Crop response, *Cotton, Soil moisture, Tension, *Soil water.

In two field experiments with cotton, the relation between moderate soil water depletion and leaf-air temperature difference (Delta T) was investigated for feasibility of measurement and possible use as

a guide to irrigation scheduling. Hourly temperatures of the upper leaves and of the air 1 m above the canopy were obtained for three cultivars of short-staple cotton and one of long-staple. In addition, hourly measurements were made of the vapor pressure 1 m above the crop. These data were taken during six irrigation cycles extending over two summers and encompassing a wide range of saturation deficit (SD). The temperature differences were measurable and predictable. When the SD remained steady from day to day, the mean daytime Delta T decreased 1 C on the day of irrigation and an additional degree the next day owing to leaf rehydration and consequent stomatal opening. CONTROLLED SPRINKLER IRRIGATION SYSTEM FOR EQUALIZED WATER DISTRIBUTION DEVELOPED IN ISRAEL.
Rhodesia Agricultural Journal, Vol 69, No 4, p 75-76, July-August, 1972. 2 fig.

Descriptors: *Irrigation practices, *Distribution systems, Irrigation systems, *Sprinkler irrigation, Application equipment, Irrigation efficiency.
Identifiers: *Israel.

A new irrigation system has been developed in Israel to achieve maximum controlled water distribution on permanent set sprinkler schemes. Equalized water distribution with the new sprinkler offers the obvious advantage of ensuring against over-saturating areas served by the first sprinklers or under-irrigating the last points in the network. It prevents water wastage resulting from over-discharge in the first units to compensate for the loss caused by the drop of pressure--up to 20 percent--as the result of friction over the length of the irrigation pipe and changes in topography experienced in conventional systems. The savings in water due to complete regulation of the outflow of each sprinkler is said to range from five to 15 percent of the total water use for a given plot, depending upon pressure and topographical conditions. These are low discharge sprinklers designed for use in all types of fruit orchards for under-the-foliage fixed irrigation. (Skogerboe-Colorado State)

SOIL CRUSTING RELATED TO SPRINKLER INTENSITY,
Auburn Univ., Ala. Dept. of Agricultural Engineering.
C. D. Busch, E. H. Rochester, and C. L. Jernigan.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 16, no 4, p 808-809, 1973. 5 fig, 2 tab, 10 ref. OWRR A-025-ALA(1).

Descriptors: *Sprinkler irrigation, *Soil strength, *Soil density, *Regression analysis, *Irrigation practices, Rainfall, Soil texture, Rain gages, Rainfall simulators.
Identifiers: *Soil crusting, Penetrometer.

Investigations of sprinkler intensities and their influence on crust strength after one and repeated irrigation cycles were made. Regression analyses were done correlating penetrometer readings of crust strength and crust moisture data. Preliminary results showed that previous sprinkling can reduce strength of crust formed by a subsequent rainfall. Other results showed that lower sprinkler intensities consistently produced a weaker crust, and that increasing numbers of water application cycles failed to show a consistent influence on crust strength. A COMPUTER SIMULATION OF CORN GRAIN PRODUCTION,
Missouri Univ., Columbia. Dept. of Agronomy.
C. H. Baker, and R. D. Horrocks.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 16, No 6, p 1027-1029, 1031, November-December, 1973. 3 tab, 22 ref.

Descriptors: *Computer models, *Mathematical models, *Plant growth, *Corn(Field), Crop response, Model studies, *Crop production, *Simulation analysis.

When the ideal simulation model is pictured, it is evident that the trend of crop research needs to be changed. Instead of researching a plant on a monthly or seasonal basis, it should be considered on a daily basis. The corn plant, like most biological systems, is a highly variable and highly buffered system. A system of this complexity does not respond to average or monthly weather -- instead it is affected each day by that day's weather. The effect of similar weather on two successive days also differs to a degree since the plant has changed. In a month's time, the plant can change many times. Development of a simulation model is not limited by computer capacity, but rather is limited by lack of mathematical definitions for the basic plant processes. (Skogerboe-Colorado State)

TRICKLE IRRIGATION -- APPLICATION UNIFORMITY FROM SIMPLE EMITTERS,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
D. A. Bucks, and L. E. Myers.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 16, No 6, p 1108-1111, November-December, 1973. 4 fig, 3 tab, 12 ref.

Descriptors: *Irrigation practices, *Surface irrigation, *Application equipment, Uniformity coefficient, Irrigation systems, *Irrigation design, Construction, Design.
Identifiers: *Drip irrigation.

Procedures for design and construction of two multiple-size systems, using a stainless-steel and microtube or spaghetti-tube emitter, were developed. Mean discharge deviations for these simple emitters operated at constant pressure were from 1.7 percent to 3.3 percent for the stainless-steel emitters, and from 1.8 percent to 2.5 percent for the microtube emitters. Performance by a multiple-diameter stainless-steel emitter system designed for row-crop usage verified the practicality of changing emitter diameters along the lateral. The theoretical performance of a 250-foot lateral with a 2-foot emitter spacing, using five sizes of stainless-steel emitters, showed a mean deviation of 1.7 percent and maximum deviations of +5.2 percent to -6.6 percent from design discharge. Actual mean deviation from design discharge was 3.1 percent, with maximum deviations of +8.8 percent to -10.8 percent in the field. (Skogerboe-Colorado State)

EVALUATION OF GRADED FURROW IRRIGATION WITH LENGTH OF RUN ON A CLAY LOAM SOIL,
Agricultural Research Services, Bushland, Tex. Southwestern Great Plains Research Center.
J. T. Musick, W. H. Sletten, and D. A. Dusek.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 16, No 6, p 1075-1080, 1084, November-December, 1973. 11 fig, 1 tab, 13 ref.

Descriptors: *Irrigation practices, *Furrow irrigation, *Infiltration rates, Surface irrigation, Runoff, Infiltration, Inflow, *Texas, Soil water, Crop production, *Sorghum, Clay loam.
Identifiers: Graded furrows.

The effects of length of run on water intake, soil water distribution, grain sorghum yields and irrigation water use efficiencies were evaluated on graded furrow irrigated Pullman clay loam at Bushland, Texas, in 1961-63 on a 900-foot run and in 1965-66 on an 1,800-foot run. Total water intake during the 15 irrigations studied ranged from 1.3 to 6.0 inches, depending primarily on soil water content at time of irrigation and surface soil consideration. Intake rates after runoff started were affected by length of run. As water advanced down the furrows, an increasing portion of the furrow length reached the basic rate which caused the average rate for the wetted furrow length to decline. (Skogerboe-Colorado State)

RATIONALE FOR OPTIMUM NITROGEN FERTILIZATION IN CORN PRODUCTION,
Agricultural Research Service, Beltsville, Md. Soils Lab.
G. Stanford.
Journal of Environmental Quality, Vol 2, No 2, p 159-166, April-June, 1973. 5 fig, 1 tab, 27 ref.

Descriptors: *Fertilizers, *Fertilization, Fertility, Nutrient removal, Leaching, *Nitrogen, Nitrates, Denitrification, Water pollution sources, Groundwater, *Corn(Field), Optimum development plans.

During the past decade, the percentage of the corn acreage in the USA receiving N fertilizer has risen steadily. By 1971, in the Corn Belt and five adjoining states, this proportion ranged from 93 to 100% of the total corn acreage. Between 1964 and 1970 the average rate of N applied to fertilized acres increased about 83% in the Corn Belt and 128% in adjacent states (Nebraska, Kansas, Michigan, Wisconsin, and Minnesota). Undoubtedly, there has been an accompanying increase in the proportion of the corn acreage receiving optimum to excessive amounts of N fertilizer. These trends emphasize the importance of developing improved procedures for achieving optimum fertilizer N use (i.e., adequate but not excessive rates, and proper timing for greater efficiency) consistent with the goal of minimizing the possibility of environmental pollution. DYNAMIC SIMULATION OF AUTOMATED SUBSURFACE IRRIGATION SYSTEMS,
Texas A and M Univ., College Station. Dept. of Soil and Crop Sciences.
C. H. M. van Bavel, J. Ahmed, S. I. Bhuiyan, E. A. Hiler, and A. G. Smajstrla.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 16, No 6, p 1095-1099, November-December, 1973. 6 fig, 1 tab, 6 ref.

Descriptors: *Irrigation practices, *Subsurface irrigation, *Automation, Computer models, Mathematical models, Soil moisture, Soil water, Soil water movement, *Simulation analysis, *Water distribution(Applied), *Water delivery.

Water delivery and distribution from a subsurface irrigation system were simulated for a simplified one-dimensional case. Water loss by surface evaporation and root uptake was taken into account in a manner reflecting its dependence upon depth and time of day. The system was defined as an automatic one, in which the water content at a given depth would turn infiltration from the buried delivery system off and on. The simulation was performed in S/360 CSMP, a dynamic simulation language that appears well adapted for this type of problem. The program is efficient and allows ready substitution of the hydraulic characteristics of the soil, the consumptive use pattern, and the root uptake distribution with depth, as well as geometrical variables. The results that in a Yolo clay loam and with a typical consumptive use and root distribution pattern, an automated system will cycle from a delivery period of about 2 hours through a redistribution period of about 40 hours, while maintaining an essentially constant water content in the root zone, provided the depth of delivery and control are properly chosen. FURROW IRRIGATION CRITERIA FOR HAWAIIAN SUGARCANE,
Hawaiian Sugar Planters' Association Experiment Station, Honolulu.
F. M. Vaziri, H. G. Collins, and W. N. Reynolds.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 99, No IR1, p 1-14, March, 1973. 4 fig, 3 tab, 3 ref.

Descriptors: Irrigation, *Irrigation practices, Furrow irrigation, *Hawaii, Hydraulics, Infiltration, *Sugarcane, Water distribution(Applied), Water control.

Empirical equations describing infiltration, advance, recession, and opportunity time for infiltration were developed by analysis of inflow-outflow-time measurements recorded during furrow irrigation of sugarcane. The measurements represent field conditions at various sugarcane stages on the Molokai soil series. A concept of relating furrow infiltration as a function of furrow length is presented. The development of equations and tables for use in the design and efficient operation of sugarcane furrow irrigation systems in the Hawaiian Islands is described. (Skogerboe-Colorado State)

SOIL ASSOCIATIONS AND LAND CLASSIFICATION FOR IRRIGATION, TAOS COUNTY,
New Mexico State Univ., University Park. Dept. of Agronomy.
H. J. Maker, J. J. Folks, and J. U. Anderson.
Available from the National Technical Information Service as PB-233 119, $3.25 in paper copy, $1.45 in microfiche. Agricultural Experiment Station Research Report 268, New Mexico State University, Las Cruces, New Mexico, 1974. 44 p, 1 fig, 7 tab, 8 ref. OWRR B-015-NMEX(24).

Descriptors: *New Mexico, *Irrigable land, *Soil classification, *Land classification, Soil investigations, Agriculture, Irrigation.
Identifiers: *Taos County(N. Mex), *Soil associations, *Irrigation potential, Soil interpretation, Soil characteristics, Soil description.

Information is presented on the suitability of soils in Taos County, New Mexico for irrigation. The acreage, general location, and relative capability of the soils for use in irrigated agriculture are given. The general soil map and a detailed soil survey provided the information necessary for the classification for irrigation. The data were organized and presented on the basis of soil associations shown on the general soil map and on the irrigation land classification map. Taos County has about 1,444,500 acres, of which about 29 percent were considered suitable for irrigation. About 33,600 acres were in irrigation class 1; 200,442 acres in class 2; 136,968 acres in class 3; and 55,044 acres in class 4. The remaining 1,018,446 acres in the county were in land class 6, which was not considered suitable for irrigation. Information also is provided on soil resources that can be used for preliminary planning for irrigated agriculture, forestry, range, urban, engineering, recreation, and wildlife uses. A general soil map and a classification of land for irrigation map, both in color are included. (Hain-New Mexico State)

SUITABILITY OF NEW MEXICO LANDS FOR IRRIGATION,
New Mexico State Univ., University Park. Dept. of Agronomy.
J. U. Anderson, and H. J. Maker.
Available from the National Technical Information Service as PB-233 122, $3.25 in paper copy, $1.45 in microfiche. Agricultural Experiment Station Research Report 276, New Mexico State University, Las Cruces, New Mexico, 1974. 28 p, 12 fig, 1 tab, 5 ref. OWRR B-015-NMEX(25).

Descriptors: *New Mexico, *Irrigable land, Soil classification, Land classification, Soil investigation, Agriculture, Irrigation.
Identifiers: *Soil associations, *Irrigation potential, Soil interpretation, Soil characteristics, Soil description.

Results are summarized of a study which was conducted to obtain the extent, nature, and distribution of irrigable land in New Mexico. Irrigation land classes were assigned to soils on the basis of data obtained from various published and unpublished detailed and reconnaissance soil surveys. The data were organized and presented on the basis of soil associations. New Mexico has about 77,866,400 acres, of which about 41 percent were considered suitable for irrigation. About 3,799,809 (5%) acres were in irrigation class 1; 10,167,058 (13%) acres in class 2; 11,030,216 (14%) acres in class 3; 6,827,297 (9%) acres in class 4. The remaining 46,042,020 acres in the state were in land class 6, which was not considered suitable for irrigation. These figures are in contrast to the 1.5 percent of the state now being irrigated. Information is provided on soil resources to be used for preliminary planning for irrigated agriculture, forestry, range, urban, engineering, recreation and wildlife use. A general suitability map prepared from the county irrigation land classification maps of the 31 county reports previously published is included. (Hain-New Mexico State)

SOIL ASSOCIATIONS AND LAND CLASSIFICATION FOR IRRIGATION, MCKINLEY COUNTY,
New Mexico State Univ., University Park. Dept. of Agronomy.
H. J. Maker, H. E. Bullock, Jr., and J. U. Anderson.
Available from the National Technical Information Service as PB-233 121, $3.75 in paper copy, $1.45 in microfiche. Agricultural Experiment Station, Research Report 262, New Mexico State University, Las Cruces, New Mexico, 1974. 68 p, 13 fig, 7 tab, 8 ref. OWRR B-015-NMEX(22).

Descriptors: *New Mexico, *Irrigable land, *Soil classification, *Land classification, Soil investigations, Agriculture, Irrigation.
Identifiers: *McKinley County(N. Mex), *Soil associations, *Irrigation potential, Soil interpretation, Soil characteristics, Soil description.

Information is presented on the suitability of soils in McKinley County, New Mexico for irrigation. The acreage, general location, and relative capability of the soils for use in irrigated agriculture are given. The general soil map based on a reconnaissance soil survey and limited detailed soil surveys provided the information necessary for the classification for irrigation. The data were organized and presented on the basis of soil associations shown on the general soil map and on the irrigation land classification map. McKinley County has about 3,495,000 acres, of which about 42 percent were considered suitable for irrigation. About 86,553 acres were in irrigation class 1; 410,917 acres in class 2; 298,331 acres in class 3; and 654,910 acres in class 4. The remaining 2,044,289 acres in the county were in land class 6, which was not considered suitable for irrigation. Information is also provided on soil resources that can be used for preliminary planning for irrigated agriculture, forestry, range, urban, engineering, recreation, and wildlife uses. A general soil map and a classification of land for irrigation map, both in color, are included. (Hain-New Mexico State)

SOIL ASSOCIATIONS AND LAND CLASSIFICATION FOR IRRIGATION, VALENCIA COUNTY,
New Mexico State Univ., University Park. Dept. of Agronomy.
H. J. Maker, C. W. Keetch, and J. U. Anderson.
Available from the National Technical Information Service as PB-233 120, $3.75 in paper copy, $1.45 in microfiche. Agricultural Experiment Station Research Report 267, New Mexico State University, Las Cruces, New Mexico, 1974. 72 p, 13 fig, 7 tab, 11 ref. OWRR B-015-NMEX(23).

Descriptors: *New Mexico, *Irrigable land, *Soil classification, *Land classification, Soil investigations, Agriculture, Irrigation.
Identifiers: *Valencia County(N. Mex), *Soil associations, *Irrigation potential, Soil interpretation, Soil characteristics, Soil description.

Information is presented on the suitability of soils in Valencia County, New Mexico for irrigation. The acreage, general location, and relative capability of the soils for use in irrigated agriculture are given. The general soil map based on a reconnaissance soil survey and limited detailed soil surveys provided the information necessary for the classification for irrigation. The data were organized and presented on the basis of soil associations shown on the general soil map and on the irrigation land classification map. Valencia County has about 3,621,000 acres, of which about 38 percent were considered suitable for irrigation. About 75,357 acres were in irrigation class 1; 477,008 acres in class 2; 531,389 acres in class 3; and 305,140 acres in class 4. The remaining 2,232,206 acres in the county were in land class 6, which was not considered suitable for irrigation. Information also is provided on soil resources that can be used for preliminary planning for irrigated agriculture, forestry, range, urban, engineering, recreation, and wildlife uses. A general soil map and a classification of land for irrigation map, both in color, are included. (Hain-New Mexico State)

EFFECTS OF VARIOUS WATER REGIMES ON STOMATAL AND MESOPHYLL CONDUCTANCES OF BEAN LEAVES,
Akademiya Nauk Estonskoi SSR, Tartu. Institut Fiziki i Astronomii.
H. Moldau.
Photosynthetica (Prague). Vol 7, No 1, p 1-7, 1973. Illus.
Identifiers: *Bean leaves, Defoliation, *Desiccation, Leaves, *Mesophyll conductances, Phaseolus-vulgaris, *Stomatal conductances, Soil flooding.

Soil-grown bean plants (Phaseolus vulgaris L.) were subjected to rewatering after desiccation, partial defoliation and flooding. Subsequent responses of the conductances of the stomata and of the mesophyll were studied in a conditioned leaf chamber under a saturating illuminance and a limiting CO2-supply. The mesophyll conductance remained constant during 4 days of desiccation to -13 bar and during the recovery of the leaf water potential from -13 to -5 bar. Changes in the photosynthetic activity of leaves were solely attributed to changes in the stomatal conductance. Defoliation of a well-watered plant caused no changes in both conductances of the remaining leaves. Defoliation of a desiccated plant resulted in an increase in the stomatal conductance, with the mesophyll conductance remaining constant. Flooding of the soil caused a sharp decrease in both conductances. It is concluded that soil-induced changes of the water deficit of leaves cause no changes in the mesophyll conductance over the whole range of leaf water potentials where stomata usually operate. Flooding of the root system probably brings about an insufficient supply of metabolites (needed for the normal course of the carboxylation reaction) from roots to leaves.--Copyright 1974, Biological Abstracts, Inc.

WATER LOSS FROM AN IRRIGATED SORGHUM FIELD: I. WATER FLUX WITHIN AND BELOW THE ROOT ZONE,
South Dakota State Univ., Brookings. Dept. of Plant Science.
L. R. Stone, M. L. Horton, and T. C. Olson.
Agronomy Journal, Vol 65, No 3, p 492-495, May-June, 1973. 5 fig, 1 tab, 6 ref. OWRR A-018-SDAK(4).

Descriptors: *Soil water, *Soil moisture, *Leaching, Tensiometers, Hydraulic gradient, Hydraulic conductivity, *Sorghum, Irrigation.

Water movement within and below the root zone of a sorghum crop was evaluated during a 31-day field study following water application. Hydraulic potential data from tensiometers placed at eight depths in the soil profile were used to determine the hydraulic gradients. Soil water flux in various depth layers was calculated using the hydraulic potential gradients and the determined hydraulic conductivity vs soil water content relationships. Upward water movement commenced in the 15 to 30 cm layer 3 days following water application and 130 to 150 cm layer after 19 days. The upward water flux into the root reached a maximum of approximately 0.2 cm/day near the end of the study period. During the 31-day study period, 6.0 cm of water were lost from the 150 cm soil profile by flux below the root zone. This illustrates the importance of considering water loss due to flux below the root zone in crop situations. (See also W74-09249) (Skogerboe-Colorado State)
W74-09248

WATER LOSS FROM AN IRRIGATED SORGHUM FIELD: II. EVAPOTRANSPIRATION AND ROOT EXTRACTION,
South Dakota State Univ., Brooking. Dept. of Plant Science.
L. R. Stone, M. L. Horton, and T. C. Olson.
Agronomy Journal, Vol 65, No 3, p 495-497, May-June, 1973. 5 fig, 9 ref. OWRR A-018-SDAK(5).

Descriptors: *Drainage, *Evapotranspiration, *Deep percolation, Soil water, Soil moisture, Tensiometers, Soil water movement, *Sorghum, Irrigation.

A method using tensiometers for obtaining evapotranspiration rates and root extraction patterns within an actively growing sorghum crop is discussed. Profile water depletion was calculated from water content profiles determined using tensiometer readings and laboratory-measured soil water characteristics. Profile water depletion minus flux below the root zone yielded the daily evapotranspiration rate. During the 31-day study, approximately 65% of the total water loss was due to flux loss from the root zone. These data clearly show the importance of considering flux below the root zone when attempting to determine evapotranspiration rates using depletion methods. The method of determining evapotranspiration rates illustrated provides an alternative to the microclimatological and lysimeter methods. (See also W74-09248) (Skogerboe-Colorado State)

FORECASTING CHANGES IN WATER BALANCE UNDER INFLUENCE OF HUMAN ACTIVITY (PROGNOZIROVANIYE IZMENENIY VODNOGO BALANSA POD VLIYANIYEM KHOZYAYSTVENNOY DEYATEL'NOSTI),
A. G. Bulavko.
Vodnyye Resursy, No 4, p 50-58, 1973. 1 fig, 3 tab, 20 ref.

Descriptors: *Forecasting, *Future planning(Projected), *Water balance, *Human population, Watershed management, Forest management, Land management, Soil management, Land reclamation, Drainage practices, Reservoir construction, Agriculture, Crop production, Runoff, Evaporation.
Identifiers: *USSR(Belorussia).

A forecast of changes in water-balance items in Belorussia resulting from man's activities in watersheds was prepared on the basis of projected plans of development of agricultural production and land reclamation in the Republic. Four types of human activity are considered: (1) changes in forested and plowed areas, (2) intensification of agriculture, (3) drainage practices such as reclamation of bogs and waterlogged soils, and (4) construction of reservoirs. Present streamflow data can be used in planning for water-resources development, since no significant changes are anticipated in the structure of the water balance or in the value and seasonal distribution of runoff in the next 10-15 years. (Josefson-USGS)

MAN-MADE LAKES: THEIR PROBLEMS AND ENVIRONMENTAL EFFECTS,
W. C. Ackermann, G. F. White, E. E. Worthington, and J. L. Ivens.
American Geophysical Union, Washington, D.C. Geophysical Monograph 17. 1973. 847 p.

Descriptors: *Environmental effects, *Artificial lakes, *Multiple-purpose reservoirs, *Lake morphology, Limnology, Hydraulics, Hydrology, Impoundments, Social aspects, Recreation, Africa, Sedimentation, *Aquatic environment.

Presented in this volume are 113 technical papers given at the third International Symposium on Man-Made Lakes, held in Knoxville, Tennessee, in 1971, organized by the International Council of Scientific Unions. Topics were divided into sessions covering opportunities and environmental effects, Man-made lakes of the world, Case studies of major artificial lakes, Reservoirs as physical systems, Limnology and biologicql systems, Reservoirs in relation to man, and Management for multiple use. Questions addressed were how man-made lakes differ from natural lakes and from place to place, and how man functions as a part of the new ecosystem as it goes through its several stages of development. There is emphasis on African lakes such as Kainji, Volta, Kariba, and Nasser. A comprehensive summary and recommendations section synthesizes the complex relationships and choices by the participants, and offers a number of guidelines designed to be useful in future decisions relating to this method of altering the natural ecosystem. LAKE MEAD, A CASE HISTORY,
Bureau of Reclamation, Denver, Colo.
D. A. Hoffman, and A. R. Jonez.
In: Man-Made Lakes: Their Problems and Environmental Effects, Geophysical Monograph 17, American Geophysical Union, Wash. D.C., 1973. W. C. Ackermann, G. F. White, and B. Worthington, editors, p 220-233, 9 fig, 1 tab, 1 append, 15 ref.

Descriptors: *Density currents, *Sedimentation, *Ecosystems, *Colorado River Basin, Dams, Lake morphology, Geologic history, Arid lands, Water quality, Earthquakes, Climatology, Limnology, Hydrology, Hunting, Fishing, Recreation, *Arizona, *Nevada, Stratification.
Identifiers: *Lake Mead, Hoover Dam, Lake Powell, Las Vegas Wash, Black Canyon, Lake Mead National Recreation Area, Virgin River basin.

A history of Lake Mead, formed by Hoover Dam in the arid Black Canyon of the Colorado River is presented. Subjects include geologic aspects, limnology, ecology, hydrology, history of man in the area, and recreation. Research is needed in the biology and ecology of the reservoir: circulation patterns in relation to Lake Powell; the cause of regime of low dissolved oxygen layers during stratification; and the effect of development in the Las Vegas Wash and Virgin River basins on water quality of Lake Mead. SEEPAGE LOSSES FROM LAKE NASSER,
High Dam Authority, Cairo (Egypt).
T. A. Wafa, and A. H. Labib.
In: Man-Made Lakes: Their Problems and Environmental Effects, Geophysical Monograph 17, Amer. Geophysical Union, Washington, D.C., 1973, W. C. Ackermannn, G. F. White, and E. B. Worthington, editors, p 287-291, 2 tab.

Descriptors: *Seepage, *Water level recorders, *Boreholes, Seepage control, *Porosity, Permeability, Aquifers, Reservoirs, Sandstones, Evaporation, Faults(Geologic), Groundwater, Piezometers, Bank Storage, Water table, Hydraulic gradient, Outlets, Inlets(Waterways).
Identifiers: *Aswan High Dam, *Lake Nasser, *U.A.R.(Egypt).

Before the construction of the Aswan High Dam forming Lake Nasser, average seepage losses were estimated to be 1000 million cu/m per year. Following construction, investigations were undertaken to confirm or correct the estimate. In total, 29 shallow bore holes and 5 deep research bore holes were drilled, of which 23 of the shallow and all the deep bore holes were completed as piezometers and were equiped with automatic water level recorders. Results showed the porosity of the overall bedding to be approximately 25 percent. Evidence of at least two groundwater aquifers in the Nubian sandstone was found, but only the upper unconfined aquifer is affected by the riverbed, while the deep confined aquifer is recharged mainly from the Eastern Desert. Investigations also showed that water seeping from the banks of the Nile below the Dam is the result of seepage loss along the banks of the reservoir. The expected seepage losses appear to have been reasonably estimated, based on present data, but studies are being continued, particularly the monitoring of flow at the inlet and outlet. FALL AND RISE OF LAGO DEL ORO,
Dept. of Civil Engineering, Knoxville. Tennessee Univ.,
R. L. A. De Jong.
In: Man-Made Lakes: Their Problems and Environmental Effects, Geophysical Monograph 17, American Geophysical Union, Washington, D.C. 1973, W. C. Ackermann, G. F. White, and E. B. Worthington, editors, p 292-294.

Descriptors: *Dam design, *Soil mechanics, *Reservoir construction, *Reservoir leakage, *Project post-evaluation, Runoff, Streambeds, Recreation seepage, Spillways, Grouting, Slurries, Sealants, Impoundments, *Arizona.

Water-holding problems were studied in the Lago Del Oro reservoir near Tucson, Arizona. Hydrologic observations showed evidence of excess seepage. Further investigations showed that problems stemmed from inadequate clay core depth, a poor seal between upper and lower clay core sections, and on one side of the reservoir bottom, conglomerate containing several old buried stream channels with occasional outcroppings in the reservoir bottom. A number of corrective measures were tested including clay slurry, chemical sealants, grouting, modification of soil distribution in the reservoir, and a clay blanket. A combination of the last two has been the most economical dependable measure. Problems encountered point out the need for comprehensive studies prior to construction of dam and reservoir projects. ECOSYSTEM OF THE SALTON SEA,
California State Univ., Long Beach. Dept. of Microbiology.
J. Kim.
In: Man-Made Lakes: Their Problems and Environmental Effects, Geophysical Monograph 17, American Geophysical Union, Washington D.C., 1973, W. C. Ackermann, G. F. White, and E. B. Worthington, editors, p 601-605. 14 ref.

Descriptors: *Saline lakes, *Salinity, *Water pollution sources, *Agricultural chemicals, Marine microorganisms, Salts, Halophilic animals, Fish, Population, Pollutants, Algae, Plankton, Nutrients, Marine bacteria, Irrigation canals, Desalination, Chlorides, Sinks, Hydrogen ion concentration, *California, Ecosystems.
Identifiers: *Salton Sea.

The ecosystem of the Salton Sea, a saline lake in southeastern California, is threatened with destruction as a result of increasing salinity and pollution of the lake. Having no outlet, the Salton Sea is a sink collecting large amounts of treated and untreated sewage from surrounding communities, agricultural chemicals and fertilizers, and natural drainage water containing nutrients and salts which are left in residual form. Chlorosities will reach the critical range for fishery and water contact sports by 1980. Each year a sudden massive die-off of millions of fish occurs due principally to toxic algae poisoning. Recommendations are cited, but emphasis is on the need to control the inflow of sewage and agriculture chemicals particularly, in addition to control of increasing salinity. PREDICTING THE HYDROLOGIC EFFECTS OF LAND MODIFICATIONS,
Arizona Univ., Tucson.
M. M. Fogel, L. Duckstein, and C. C. Kisiel.
Paper no. 73-250 for presentation at 1973 meeting of American Society of Agricultural Engineers, University of Kentucky, Lexington, June 17-20, 1973. 14 p, 5 fig, 1 tab, 22 ref. OWRR B-032-ARIZ (5).

Descriptors: *Forecasting, *Stochastic processes, *Peak discharge, *Hydrologic data, *Simulation analysis, Water yield, Sediment yield, Watershed management, Precipitation(Atmospheric), Evaporation, Small watersheds, Storm runoff, Unit hydrographs.
Identifiers: Hydrologic forecasting.

A methodology that can be used to predict long-term hydrologic effects of land modifications on ungaged watersheds is presented. An event-based stochastic model of precipitation provides input into a deterministic watershed model that transforms the inputs into desired hydrologic data such as water yield, peak runoff rate, and sediment yield. The Soil Conservation Service method is used to transform rainfall into runoff. On a large scale, the procedure can be used to determine watershed treatment effects on the optimum size of a floodwater retarding structure. The model is designed to reduce uncertainties in the current practice of implying that rainfall and runoff have similar frequency distributions. The model also provides flexibility in that elevation effects can be accounted for, the distribution function of mean areal rainfall can be utilized, the probability density function of runoff can be obtained, and simultaneous synthetic sets of rainfall, runoff, and soil moisture can be generated for more detailed hydrologic investigations. THE BIRCHWOODS OF MONTANE DAGESTAN (IN RUSSIAN),
Dagestanskii Gosudarstvennyi Universitet, Makhachkala (USSR).
P. L. L'Vov.
Bot Zh, Vol 58, No 1, p 106-113, 1973.
Identifiers: Alder, Birch, *Birchwoods, Conservation, *Montane regions, Oak, Rhododendron-luteum, *USSR(Dagestan-montane).

Species composition of mixed and pure birchwoods was studied in the 3 geomorphological regions of Daghestan (Russian SFSR, USSR): intramontane, extramontane and high mountain. Only in the high mountain region is the subalpine forest zone clearly defined, characterized by successively alternating subalpine sparse woods and subalpine dwarf shrubs. In intermontane Daghestan, the subalpine forest zone is characterized only by sparse birchwoods, while in the extramontane regions, by birch, oak, occasionally alder, and thickets of Rhododendron luteum. These differences are related to characteristics of each geomorphological region (altitude above sea level, presence or absence of glaciers, amount of precipitation, rock composition). In addition, in all 3 regions, subalpine elements dominated in the grassy covering of the birch groves. The birchwoods of Daghestan play an important role in preventing soil erosion, affect mountain streams, are economically valuable and must therefore be protected from exploitation.--Copyright 1974, Biological Abstracts, Inc.

Descriptors: *Groundwater, *Pumping, *Computer models, Aquifers, Wells, *Sandstones, *Drawdown, Water table, Hydraulic conductivity, Artesian aquifers, Groundwater recharge, Potentiometric level, Artesian head, *Arizona, Simulation analysis.
Identifiers: *Navajo Sandstone groundwater(Ariz), Slurry pumping.

Computer modeling of the Navajo Sandstone groundwater system is used to determine the relationship between mining pumping and declines in the potentiometric surface at locations within the Navajo and Hopi Indian communities. The computer simulation developed is a modified version of the basic artesian aquifer routine used by the Illinois State Water Survey. Assuming no abnormal leakage paths, mining usage will not appreciably affect Indian wells located in the Mesa-verde formation. Theoretical drawdown estimates can be made for locations in the artesian and unconfined areas of the Navajo Sandstone. The drawdowns vary from zero to less than 20 percent of the artesian head elevation above the Navajo Sandstone formation in confined areas. (Mastic-Arizona)

NORTHERN ILLINOIS USES STORAGE EFFECTIVELY,
D. P. Fowler.
Energy Pipelines and Systems, Vol 1, No 4, p 46-47, April, 1974.

Descriptors: *Sand aquifers, *Natural gas, *Storage, *Illinois.

The use of natural underground aquifers by the Northern Illinois Gas Co. for storage of natural gas is described. The aquifers are large, water bearing, dome shaped rock layers of porous sandstone. The sandstone spaces hold water much like gigantic sponges. Natural gas is pumped or injected into the sandstone at pressure great enough to push the water aside, and then downward. An overlying layer of impermeable caprock, usually shale or dense limestone keeps the gas from migrating to the surface. As more gas is injected, the shape of the dome provides the unique trapping mechanism. The aquifers deliver as much as 25% of the total gas sold during the winter, and as much as 55% of the gas distributed on an exceptionally cold day. (Merritt-FIRL)

Descriptors: *Geothermal studies, *Thermal water, Thermal springs, Hot springs, Hydrothermal studies, Thermal power, Hydrogeology.
Identifiers: *Geothermal power, *USSR(Caveasus).

During the exploitation of many gas-oil fields of the Caucasus a great quantity of thermal water is obtained. This water, with great economical effect, is sometimes used for hot water for industrial and agricultural enterprises and for heating commercial services. The development of Middle Miocene deposits over many years led to a considerable decrease of hydrodynamic levels and expansion of cones of depresseions for scores of kilometers. As a result of this there was reduction of yield and even exhaustion on many thermal springs. The most favorable conditions for development of the hydrodynamic system of the Black Mountains, Peredovoy ridges can be created by recovery and injection of 100,000 or 50,000 cu m of water per day. Descriptors: *Geothermal studies, *Heat flow, *Borehole geophysics, Thermal conductivity, Temperature, Instrumentation.
Identifiers: *Geothermal power, *Czechoslovakia.

In Czechoslovakia geothermal measurements have been made since about 1964. A map of the heat flow on the territory of Czechoslovakia was made from more than 40 measurements in the boreholes. For measurement of the thermal conductivity on samples of rocks a fully automatic working apparatus was constructed. For direct measurements of the temperature gradient in boreholes a special probe 2 meters in length was designed, with a sensitivity of 0.01 deg C when measuring the gradient and 0.1 deg C when measuring the absolute temperature. GROUND SUBSIDENCE OF A GEOTHERMAL FIELD DURING EXPLOITATION,
Ministry of Works, Wairakei (New Zealand).
J. W. Hatton.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1294-1296, 1973. 3 fig.

Descriptors: *Subsidence, *Withdrawal, *Hydrothermal studies, *Geothermal studies, Thermal power, Water levels, Hydrogeology, Land subsidence.
Identifiers: *New Zealand, Geothermal power.

Ground subsidence in the geothermal field at Wairakei, New Zealand, was first measured in 1956 when bench mark levels were compared with those established in 1950. The area affected by subsidence probably exceeds 25 square miles. The area of maximum subsidence occurs outside the production field. The present maximum subsidence rate in this area is 1.3 feet per annum. Some measurements of horizontal ground movement were made, and a relationship between this surface strain and vertical subsidence has been found. Exploitation of the Wairakei geothermal field has clearly been the major cause of the ground subsidence. At first, a simple relationship between subsidence and aquifer drawdown was evident, indicating elastic ground compression caused by a loss of buoyancy. In more recent years the ground has continued to subside despite a stabilizing of aquifer pressure. Although the region of maximum subsidence occurs outside the production field, the steam transmission pipes and the main concrete hot water drain at Wairakei have been affected by the ground movement. PHOTOGRAMMETRIC TECHNIQUES APPLIED IN THE DEVELOPMENT OF GEOTHERMAL RESOURCES IN MATSUKAWA AND OTAKE GEOTHERMAL AREAS USING A VECTOR METHOD,
International Geodetic Survey Inst. Co. Ltd., Tokyo (Japan).
N. Todoki.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1302-1309, 1973. 6 fig, 1 tab, 6 ref.

Descriptors: *Photogrammetry, *Aerial photography, *Structural geology, Geothermal studies, Faults(Geologic), Terrain analysis, Stress, Strain.
Identifiers: *Japan, Geothermal power.

Many fracture zones are observed as linear features (photo-lineaments) in aero photographs. Photo-lineaments are translated and defined as character vector (C.V.). Using such procedures, the position and the depth of the geothermal reservoir in the Matsukawa and Otake areas of Japan were successfully determined. The geothermal zones are controlled by the C. V. oriented NE-SW and NS in Matsukawa area, and NE-SW, EW and NS in Otake, respectively. The distribution of resources shows the presence of various zonal harmonic periodicities. STATICAL INTERPRETATION OF CHEMICAL RESULTS FROM DRILLHOLES AS AN AID TO GEOTHERMAL PROSPECTING AND EXPLOITATION,
Department of Scientific and Industrial Research, Wellington (New Zealand).
In: Proceedings of the osium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1323-1339, 1973. 7 fig, 1 tab, 26 ref, append.

Descriptors: *Geothermal studies, *Hydrothermal studies, *Geochemistry, *Water chemistry, *Statistical methods, Exploration, Heat flow, Thermal water, Mineral water, Boreholes, Thermal springs, Sampling.
Identifiers: *Borehole geochemistry, *New Zealand, Geothermal power.

In prospecting a geothermal field, it is necessary to allow a number of wells to discharge freely to test the potential of the field. Determinations of the concentrations of chloride and silica on water separated from the discharge at atmospheric pressure can be used to give information about the uniformity of the underground water. For this purpose, enthalpy should be plotted against chloride concentrations on paper with lines showing the effects on enthalpy and chloride of loss of steam, dilution, and loss of heat by conduction. When production wells are delivering separated steam to a steam line to the power station, samples of water separated at atmospheric pressure should be analyzed to give information on changes in the underground water supplies to the drillholes. Statistical studies with computer calculation of changes of chloride with time for groups of wells can give average yearly changes of enthalpy, which are much more accurate than changes found from direct enthalpy determinations and also give indications of the reasons for the changes. THE BEHAVIOUR OF THE WAIRAKEI GEOTHERMAL FIELD DURING EXPLOITATION,
Ministry of Works, Wellington (New Zealand).
R. S. Bolton.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1426-1439, 1973. 18 fig, 5 ref.

Descriptors: *Geothermal studies, *Investigations, *Hydrogeology, *Aquifer testing, Drilling, Exploration, Hydrothermal studies, Borehole geophysics, Thermal water, Thermal power, Costs, Data collections, Hydrologic data.
Identifiers: *Geothermal power, *New Zealand.

Since the first bore discharged at Wairakei, New Zealand, in 1951, the total mass drawn from the field up to the middle of 1969 was 660,000,000 tons. Over this period, the rate of discharge has varied considerably from the gradual build up in the early years, to relatively sudden and substantial increses and decreases which have been imposed on the system from time to time. The Wairakei system consists basically of a highly permeable hot water aquifer contained within almost impermeable boundaries. Under exploitation, the dominant influence on the system is the saturation temperature pressure relationship for water, but the withdrawal of steam from the upper levels and the existence of a hot inflow at the lower levels have also played an important part. A satisfactory mathematical model having a predictive ability has not yet been formulated, but from a consideration of the past behavior, in general terms, the power output of the Wairakei station can be sustained at or near its present level for a number of years to come. A STUDY OF THE RESERVOIR AT THE MATSUKAWA GEOTHERMAL FIELD,
Geological Survey of Japan, Kawasaki.
K. Baba, S. Takaki, G. Matsuo, and K. Katagiri.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1440-1447, 1973. 6 fig, 5 ref.

Descriptors: *Geothermal studies, *Investigations, *Hydrogeology, *Aquifer testing, Drilling, Exploration, Hydrothermal studies, Borehole geophysics, Thermal water, Thermal power, Costs, Data collections, Hydrologic data.
Identifiers: *Geothermal power, *Japan(Matsukawa).

The geothermal fluid reservoir of the Matsukawa geothermal field is below the Matsukawa andesite layer. Hot water and steam can be obtained from and below the lower part of dacite tuff layer, which lies beneath Matsukawa andesite. The lost circulation data during drilling often show the possible positions of a more permeable zone. Electric logging data give the clue to deduce whether the strata are permeable or not. Temperature logs obtained before discharging geothermal fluids often indicate the existence of a localized hot zone. In accordance with theory, some probable patterns of temperature and pressure near the well are shown, and their applications to the examples obtained at the wells of Matsukawa and its adjacent geothermal areas are discussed. ESTIMATION OF HYDROTHERMAL SYSTEMS BY MEANS OF WELL-HEAD OBSERVATIONS,
National Research Center for Disaster Prevention, Tokyo (Japan).
K. Yuhara.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics, 1970, Special Issue 2, Vol 2, Part 2, p 1458-1462, 1973. 4 fig, 2 tab, 8 ref.

Descriptors: *Geothermal studies, Hydrothermal studies, *Groundwater movement, Equations, Model studies, Thermal water, Drawdown, Water table, Boiling, Steam, Thermodynamics.
Identifiers: *Geothermal power.

Most geothermal steam originates from the underground boiling of groundwater. To find out the boiling conditions of thermal water in steam wells or reservoirs, a theoretical method is proposed. It can show the temperature, the pressure, the ascending velocity and the boiling depth of the thermal water in the well or the reservoir as functions of steam properties which can be observed at the wellhead. The knowledge gained by this method may be useful in estimating the hydrothermal system of the geothermal field. A few practical examples are given. (See also W74-08973) (Knapp-USGS)

CURRENT STATUS OF GEOTHERMAL POWER PLANTS AT THE GEYSERS, SONOMA COUNTY, CALIFORNIA,
Pacific Gas and Electric Co., San Francisco, Calif. Dept. of Engineering.
D. B. Barton.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1552-1559, 1973. 4 fig.

Descriptors: *Geothermal studies, *Thermal power, *California, Thermal powerplants, Hydrothermal studies, Steam.
Identifiers: *Geothermal power.

Electric power has been produced in commercial quantities from geothermal steam at The Geysers in Sonoma County, California, since 1960. Development at The Geysers started in 1922 when the first steam well was drilled. Eight wells were drilled from that date through 1925. However, commerical development was not feasible at that time. Some steam was used at an adjacent resort for heating and also, through use of two small reciprocating steam engine-generators, lighting was provided until 1959. Present development started with well drilling in 1955. As condensed water is contaminated, principally with ammonia, sulfides, and boron, its disposal presents a serious problem. Injection wells are currently being used for this purpose. The steam supply is slightly superheated and contains ammonia, carbon dioxide, and hydrogen sulfide as principal contaminants, amounting to 0.3% to 2.0% of the steam. PHYSICO-CHEMICAL SAMPLING OF HIGH TEMPERATURE WELLS IN CONNECTION WITH THEIR ENCRUSTATION BY CALCIUM CARBONATE,
Adademiya Nauk SSSR. Novosibirsk. Institut Neorganicheskoi Khimii.
P. A. Kryukov, and E. G. Larionov.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1624-1628, 1973. 9 fig, 2 tab, 6 ref.

Descriptors: *Hydrothermal studies, *Thermal power, *Water chemistry, *Scaling, Water wells, Well casings, Well screens, Corrosion, Sampling, Instrumentation, Water temperature.
Identifiers: *Geothermal power, *USSR.

The most important practical problems of physical-chemical studies of high-thermal underground waters are connected with the conditions of well encrustation due to calcium carbonate. Methods were developed for use in high-thermal waterfields

of Bolshebanny and Pauzhetsky in Kamchatka and Goryachy Plazh (Hot Beach) on Kunashir island, USSR. For water sampling of operating wells, a probe (a tube made of stainless steel) was used and inserted in the well through a gasket below the vaporization level. To measure pH in deep-seated water samples the probe was connected to a high-temperature cell with a glass and reference electrodes mounted in autoclave where natural pressure and temperature conditions were created. A thermistor was used for the continuous temperature measurement at different depths and for determining the position of vaporization zones in operating wells. (See also W74-08973) (Knapp-USGS)

NEUTRON WELL LOGGING IN HAWAII,
Hawaii Univ., Honolulu. Water Resources Research Center.
F. L. Peterson.
Available from the National Technical Information Service as PB-233 124, $3.25 in paper copy, $1.45 in microfiche. Technical Report No 75, February 1974. 42 p, 15 fig, 4 tab, 9 ref. OWRR A-032-HI(2). 14-31-0001-3511.

Descriptors: *Hawaii, *Logging(Recording), Water wells, *Porosity, Gamma rays, Radiation, Basalts, Correlation analysis, Equipment, Aquifers, Water yield.
Identifiers: *Neutron well logging.

The primary objective was to apply neutron logging techniques to the problem of obtaining reliable porosity data and relating these to water yields from Hawaiian aquifers. Neutron well logging in Hawaiian basaltic formations has produced much important qualitative and quantitative information. The most important application has been the determination of porosity in the saturated zones. Interpretation of neutron log responses in Hawaiian basaltic formations is similar to conventional neutron log interpretation in sedimentary formations. Neutron count varies as an inverse function of porosity. High neutron counts are indicative of low porosities and low neutron counts are indicative of high porosities. In general, the neutron logs are extremely responsive to detailed changes in formation porosity, and of particular importance is that the reproducibility of neutron logs from the same well is excellent. Neutron logs from Hawaiian wells also are extremely responsive to the saturated-unsaturated boundary and to the casing termination. Surprisingly, the neutron logs show little consistent response to nominal hole diameter or borehole fluid salinity. Probably the best use of the neutron logs is in conjunction with other borehole geophysical logs. Correlation between neutron logs and electric resistivity logs is particularly good.

ARTIFICIAL RECHARGE--STATE OF THE ART,
Geological Survey, Lubbock, Tex.
R. F. Brown, and D. C. Signor.
Ground Water, Vol 12, No 3, p 152-160, May-June 1974. 48 ref.

Descriptors: *Artificial recharge, *Waste water disposal, Water storage, Hydrogeology, *Reviews, Research and development, Water quality control, Water management(Applied).

The largest potential underground reservoir for the storage of potable water is in the unsaturated zone. Artificial recharge has many similarities to liquid-waste disposal through deep wells. In both, the problem is to place liquid in a permeable lithologic unit at an economic rate, to predict movement and the chemical reactions and physical changes that take place while the liquid is in the reservoir. In both artificial recharge and liquid-waste storage, the nature of the storage must be known, particularly that of the unsaturated zone. Water commonly is recharged by surface spreading through basins or by induced recharge from adjacent streams and lakes or through injection wells. Research in recharge through basins has been dominated by mathematical models based on idealized conditions and empirical relations, derived by experimental sequencing of recharge operations, and operational controls in the pretreatment of recharge water. Recharge by injection wells has been undertaken in a variety of hydrologic environments. In Israel, efforts have been directed toward the analyses of diffusion and dispersion of the injected water. Much research in the United States has been directed toward the movement of bacteria and organic matter through an aquifer and toward the chemical modeling of changes in recharged water as it moves. BORE HOLE SAMPLING OF SATURATED UNCEMENTED SANDS AND GRAVELS,
Commonwealth Scientific and Industrial Research Organization, Syndal (Australia). Div. of Applied Geomechanics.
C. M. Barton.
Ground Water, Vol 12, No 3, p 170-181, May-June 1974. 2 fig, 11 ref, append.

Descriptors: *Sampling, *Boreholes, Core drilling, Core logging, Sands, Gravels, Cores, Water wells, Equipment.
Identifiers: *Borehole sampling.

Borehole sampling of loose saturated sands and gravels forms a very important part of water well investigations. The materials are often difficult to sample and the adoption of adequate equipment and techniques can sorely tax the ingenuity of the driller. In some situations, the standard exploration sampling procedures can provide satisfactory information, while in others, it is necessary to resort to more precise techniques. A great variety of samplers have been designed including types such as open drive, piston drive, jet and extension flap samplers. No single sampler can cover the very wide range of material conditions and operational requirements which may be met during the drilling of water wells. In extreme circumstances, particularly for uncemented or poorly cemented gravels, it may be found necessary to stablize the strata prior to sampling. (Knapp-USGS)

A QUIET REVOLUTION: FLORIDA'S FUTURE ON TRIAL,
Florida State Senate, Tallahassee.
D. R. Graham.
The Florida Naturalist, Vol 45, No 5, p 146-151, 1972. 1 photo.

Descriptors: *Florida, *Water supply, *Land use, Watersheds(Basins), Legislation, Water resources development, Droughts, Non-structural alternatives, Zoning.

A counter-movement is underway among the states to recapture some of the land use powers which had previously been delegated to local government. Environmental crises have provided the catalyst for enactment of state land use legislation. In Florida, a crisis appeared in form of an immediate drought--and also uneasiness over current and projected population growth. During 1970 and 1971, the water supply for over two million residents reached dangerously marginal levels, and for the first time, the flood control districts pumped surface water into well fields. Thus, the

dwindling supply of water in canals and conservation areas was committed to avoid massive salt water intrusion in the water supply of Dade County. A special conference noted that in order to provide an adequate long-range water supply, the state must have a comprehensive land and water use plan. The conference also articulated the concern over population pressures and concluded that there is a limit to the number of people which the south Florida basin can support. Numerous pieces of legislation were enacted following the conference to provide a plan assessing the quality and quantity of natural resources, especially water. (Ritchie-Florida)

ANNUAL REPORT ON GROUND WATER IN ARIZONA, SPRING 1972 TO SPRING 1973.
Geological Survey, Phoenix, Ariz.
Arizona Water Commission Bulletin 7, April 1974. 46 p, 31 fig, 3 plates, 1 tab, 2 ref.

Descriptors: *Groundwater, *Arizona, *Water utilization, *Withdrawal, *Water levels, Drawdown, Water yield, Water resources development, Data collections, Hydrologic data.

Water levels in selected wells and annual groundwater pumpage in most of the developed areas in Arizona were determined. Maps show hydrologic conditions in Sacramento and Hualapai Valleys, potential well production by areas, depth to water in selected wells in spring 1973, and change in water levels in selected wells from 1968 to 1973. Nearly two-thirds of Arizona's water supply comes from the groundwater reservoirs. Although municipal and industrial uses are increasing, the greatest use is for irrigation of crops. For the 20th consecutive year, the withdrawal of groundwater exceeded 4 million acre-feet. In 1972 the withdrawal of groundwater was nearly 5 million acre-feet. (Knapp-USGS)

FOREST FIRES DAMAGE MORE THAN TREES,
American Forestry Association, Washington, D.C.
C. A. Connaughton.
American Forests, Vol 78, p 30-31, 60-62, August 1972. 2 photo.

Descriptors: *Burning, *Forest management, *Watershed management, *Forest fires, Infiltration, Flood protection, Flood damage, Carrying capacity, Erosion control, Recreation, Wildlife conservation, Public lands, Surface runoff, Channelization, Flood plain zoning, Watershed protection.
Identifiers: Controlled burning.

The protection of forest land from wildfires is necessary in order to provide protection from floods, which would invariably follow. It was watershed values in relation to fire, not forest production values, that triggered the designation of public lands as national forests. When a fire occurs on a steep mountain watersheds subject to torrential storms, devastating mudrock flows can be expected with major loss of property and even life, since the runoff is greatly accelerated and can carry large volumes of debris. With plant cover and normal soil infiltration rates, water of the best quality will be yielded. With plant cover destroyed by fire, debris laden streams may result with adverse influence on water supplies, fish spawning, reservoirs, and other hydraulic water quality features. After a watershed area is burned over, the problem arises as to what can be done to protect and rehabilitate the watershed. If flood damage is likely, land managers can immediately plan to restore the ground cover. This is usually done by seeding a quick growing plant. Sometimes preventative steps are undertaken such as debris racks, enlarged culverts, channel clear-out, and relocation of critically situated improvements. (Sperling-Florida)

EFFECT OF URBANIZATION ON RUNOFF FROM SMALL WATERSHEDS,
Arizona Univ., Tucson. Water Resources Research Center.
S. E. Kao, M. M. Fogel, and S. D. Resnick.
In: Hydrology and Water Resources in Arizona and the Southwest, Proc. of the 1973 meetings of the Arizona Section-American Water Resources Assn. and the Hydrology Section-Arizona Academy of Science, May 4-5, 1973. Tucson, Arizona, p 86-91 (1973). 5 fig, 3 tab, 8 ref. OWRR B-012-ARIZ(4) and B-023-ARIZ(3).

Descriptors: *Urbanization, *Watersheds(Basins), Runoff, *Urban runoff, *Rainfall-runoff relationships, Infiltration, Rainfall, Rainfall intensity, Peak discharge, Regression analysis.

Hydrologic data obtained from three urban and one rural experimental watersheds were analyzed to determine urbanization effects on runoff. A Soil Conservation Service procedure was used to explain the relationship between rainfall amounts and runoff. A runoff curve number obtained indicated that convective storm rainfall can be related to the runoff volume from small, semiarid watersheds. A linear relationship existed between runoff volume and its corresponding peak discharge rate. Urban watersheds with a high percentage of impervious areas may not necessarily produce high peak rates for a given volume of runoff. Results show that the SCS method of relating runoff volume to rainfall is sufficiently sensitive to determine the effect of urbanization on the volume of runoff. (Mastic-Arizona)

4D. Watershed Protection

EFFECT OF LONG-TERM MANAGEMENT ON PHYSICAL AND CHEMICAL PROPERTIES OF THE COSHOCTON WATERSHED SOILS,
Agricultural Research Service Coshocton, Ohio. North Appalachian Experimental Watershed.
W. M. Edwards, J. L. McGuiness, D. M. Van Doren, Jr., G. F. Hall, and G. E. Kelley.
Soil Science Society of America Proceedings, Vol 37, No 6, p 927-930, November-December, 1973. 5 tab, 22 ref.

Descriptors: *Water supply development, *Soil conservation, Water conservation, Runoff, Fertility, Erosion control, Water pollution sources, *Ohio, Watersheds(Basins), *Crop response.
Identifiers: *Coshocton watershed(Ohio).

After 30 years of differential treatment, 0.7- to 3.2-ha watersheds in improved management had higher crop yields and less runoff and erosion than watersheds under prevailing management. Soil samples were taken from the topsoils, plowsoles, and B horizons of the watersheds to determine the effect of such management on soil physical and chemical characteristics. Large changes in chemical characteristics resulted from the higher fertilization associated with improved management but the changes generally did not persist below the topsoil layer. Measurable differences in physical characteristics of the watershed soils were slight and were confined to the topsoil layer. Differences in crop yield and hydrologic performance are attributed to fertilization, crop growth, and tillage differences associated with the two levels of management. (Skogerboe-Colorado State)

5. WATER QUALITY MANAGEMENT AND PROTECTION

METHOD OF PURIFYING WATER,
S. R. Kennedy.
U.S. Patent No. 3,801,501, 3 p, 2 ref; Official Gazette of the United States Patent Office, Vol 921, No 1, p 305, April 2, 1974.

Descriptors: *Patents, *Waste water treatment, *Chemical reactions, *Neutralization, *Water purification, *Water supply, pH, Iron, Ammonia, Flocculation, Chlorination, Potable water, Water reuse.
Identifiers: *Chemical treatment, Sulfuric acid.

Polluted water is first mechanically treated to clarify it and remove most of the suspended or retained solids. The treated water is mixed with sulfuric acid to decrease the pH to 2.5 and the acidified water is maintained at this pH for at least 3 1/2 minutes. The effluent from this step is monitored so that the pH can be maintained at the desired point. Maintenance of the desired pH is accomplished by introducing a further amount of sulfuric acid during the period before the next step if the pH begins to rise above the selected pH. The acid-containing water is then brought in contact with a source of iron such as iron bars, iron plates, or scrap iron in sufficient quantity to have 3.2 square feet of surface of the iron exposed to the acid liquid for every gallon per minute flow. The reaction with the iron takes place during the retention time of 6 minutes in the iron treatment tank. The pH rises to about 3.5. After the iron treatment the water is neutralized utilizing ammonia. The water is thoroughly mixed with the ammonia so that the neutralizing is effective throughout and the water is brought to a pH of at least 7. In lieu of ammonia, sodium hydroxide, barium hydroxide or potassium hydroxide may be substituted. The iron salt in the water acts as a flocculating agent but other flocculating agents such as aluminum sulfate may be added. The water may also be subsequently treated with chlorine and also mechanically degasified to improve the quality of the effluent. (Sinha-OEIS)

5A. Identification Of Pollutants

USE OF DAPHNIA MAGNA FOR THE MICROBIO-ASSAY OF PESTICIDES, I. DEVELOPMENT OF STANDARDIZED TECHNIQUES FOR REARING DAPHNIA AND PREPARATION OF DOSAGE MORTALITY CURVES FOR PESTICIDES,
D. E. H. Frear, and J. E. Boyd.
Journal of Economic Entomology, Vol 60, p 1228-1239, 1967.

Descriptors: *Bioassay, *Daphnia, Testing procedure, Pesticides, Pollutant identification, *Pesticide residues, Toxicity, Insecticides, Mortality, Water pollution effects.

It is possible to rear Daphnia magna under closely-controlled laboratory conditions, when asexual reproduction yields a homogeneous population suitable for microbio-assay of pesticide residues. Tests with various insecticides showed that some were toxic even in very low trace concentrations. Detailed procedure is given for rearing daphnids and using them for bio-assays, and dose-mortality curves and LD50 values are given for 56 common pesticides. (See also W74-08715)
W74-08714

USE OF DAPHNIA MAGNA FOR THE MICROBIO-ASSAY OF PESTICIDES. II. COMPARISON OF MICROBIO-ASSAY WITH GAS CHROMATOGRAPHY FOR ANALYSIS OF PESTICIDE RESIDUES IN PLANT EXTRACTS,
D. E. H. Frear, and N. S. Kawar.
Journal of Economic Entomology, Vol 60, p 1228-1239, 1967.

Descriptors: *Bioassay, Daphnia, Testing, Pesticide residues, Gas chromatography, Toxicity, Pollutant identification, Toxicity, Insecticides, Mortality, DDT, Water pollution effects.
Identifiers: Ethion, Lindane.

The Daphnia bio-assay method was compared with gas chromatography for determining traces of pesticides (DDT, ethion, and lindane), and gas chromatography gave more accurate and more consistent results. (See also W74-08714)
W74-08715

AN INVESTIGATION OF THE COULTER COUNTER IN 'BIOMASS' DETERMINATIONS OF NATURAL FRESHWATER PHYTOPLANKTON POPULATIONS,
Royal Holloway Coll., Englefield Green (England).
J. H. Evans, and S. M. McGill.
Hydrobiologia, Vol 35, No 3/4, p 401-419, 1970 (Illus).

Descriptors: *Algae, *Growth rates, *Phytoplankton, *Biomass, Water pollution effects, Pollutant identification.
Identifiers: Coulter counter.

During the period Nov. 1965 to Nov. 1968 an investigation was made into the use of the Model A Industrial Coulter Counter for determining the biomass of freshwater phytoplantkon. Parallel determinations of other parameters, including algal numbers, calculated algal volumes, dry weight, C content and chlorophyll pointed towards the general validity of the results obtained by the electronic method provided the background level of non-algal detritus is relatively low. The importance of parallel determinations, especially those involving visual inspection of samples, is emphasized. For uni-algal samples, either from culture or nature, or for natural samples dominated by 1 sp., the Coulter Counter does not necessarily give a quicker result than traditional methods of analysis. However, for at least 2 reasons the Coulter Counter adds a most useful new dimension to the realm of phytoplankton analysis. For assemblages of algae, whether or not certain species are dominant or co-dominant, a more rapid determination of a result, which can be taken to represent the biomass, is possible than by other methods. Such results, expressed here as total particulate volume (T.P.V.), can be accepted as being as accurate as those obtained by any other method and are probably better than some. In addition to the single figure T.P.V. result for a sample, volume analyses within selected size and particle number ranges can be made.
W74-08727

HEAVY METAL CONCENTRATIONS IN MUSEUM FISH SPECIMENS: EFFECTS OF PRESERVATIVES AND TIME,
Smithsonian Institution, Washington, D.C. Dept. of Vertebrate Zoology.
R. H. Gibbs, Jr., E. Jarosewich, and H. L. Windom.
Science, Vol 184, No 4135, p 475-477, April 26, 1974. 2 fig, 5 ref.

Descriptors: *Cadmium, *Copper, *Zinc, Mercury, *Lead, Fish physiology, Time, *Heavy metals, *Pollutant identification.
Identifiers: Metals concentration, *Preservatives effects.

Higher concentrations of cadmium, copper, zinc, and sometimes lead, and lower concentrations of mercury and sometimes lead were found in specimens of myctophid fish preserved for one month in formalin, ethyl alcohol, and isopropyl alcohol as compared with unpreserved frozen specimens. Properties of the preservatives and species differences in fish tissues both influence these metal concentrations. Until the changes resulting from preservation are understood, comparisons of concentrations of metals between museum specimens and unpreserved or frozen specimens must be considered unreliable. (Sandoski-FIRL)

DESIGN OF COST-EFFECTIVE WATER QUALITY SURVEILLANCE SYSTEMS,
Raytheon Co., Portsmouth, R.I. Oceanographic and Environmental Services.
V. Beckers, and G. Chamberlain.
Copy Available from GPO Sup Coc as EP1.23:600/5-74-004, $4.05; microfiche from NTIS as PB-232 979 $1.45. Environmental Protection Agency, Socioeconomic Studies Series Report EPA-600/5-74-004, January 1974. 413 p, 91 fig, 34 tab, 31 ref. EPA Program Element 1BA030, 68-01-0703.

Descriptors: *Network Design, *Monitoring, *Mathematical Models, *Systems Analysis, *Data Collection, Reliability, Maintenance, Costs, Water Quality, Pollution Abatement, *Ohio, *Pennsylvania, Water Pollution, Measurement, Water Quality Control, Water Quality Act.
Identifiers: *Beaver River Basin(Ohio-Penn), *Cost Effectiveness, Surveillance, Ohio River Basin.

This report presents the development and sucessful demonstration of quantitative methods for the design of river basin water quality surveilance systems for pollution abatement. The methods provide a systematic approach to the consideration of expected stream conditions, system characteristics, equipment performance, and cost in the selection of a preferred system design from among a number of candidates. In the systems approach, the total system is evaluated for cost and effectiveness. Mathematics previously developed to describe the effectiveness of sampling is used. The analysis of performance draws heavily on reliability and maintainability technology. Data availability remains a constraint to the general application of the methods. The methods are computerized and the computer programs are detailed. They make use of the information available from the computerized river basin models now under general development. They are demonstrated to function satisfactorily on the Beaver River Basin when artificial data are used to supplement the data base. It is concluded that the methods are acceptable for use by governmental water quality agencies under the existing constraints. (EPA)
W74-08825

INVESTIGATION OF SURFACE FILMS - CHESAPEAKE BAY ENTRANCE,
Virginia Inst. of Marine Science, Gloucester Point.
W. G. MacIntyre, C. L. Smith, J. C. Mundy, V. M. Gibson, and J. L. Lake.
Copy Available froT GPO Sup Doc as EP1.23:670/2-73-099, $2.05; microfiche from NTIS as PB-232 968, $1.45. Environmental Protection Agency Technology Series Report EPA 670/2-73-099, February 1974. 168 p, 32 fig, 22 tab, 105 ref. EPA Project 15080 EJ0.

Descriptors: *Oil spills, *Estuarine environment, *Chesapeake Bay, Oil Pollution, Estuaries, Currents, Sampling, Chemical Analysis, Chromatography, Chlorinated Hydrocarbons, Pesticides, Liquids, *Path of pollutants.
Identifiers: *Surface films, *Oil slicks, Remote sensing, Hydrocarbon analysis, Oil aging, Fatty acids.

Experimental point source oil releases have been conducted in the Chesapeake Bay mouth area. Predictions of oil slick motion were tested, and slicks were sampled and analyzed to measure their aging rates over periods up to 32 hours. Remote sensing techniques were used to detect and measure the spreading rate of oil. Some laboratory oil film experiments were done to further document and elucidate aging processes. Results indicate a reasonable motion prediction, an explanation of the non-biological initial aging of oil films, and a fair corroboration of a theoretical oil spreading model. Indigenous surface films in the study area were analyzed for lipid and chlorinated hydrocarbon content. Hydrocarbons were 300-500 microgram per liter and fatty acids and ester 700-7800

microgram per liter in surface film samples. Chlorinated hydrocarbons were generally less than 100 parts per trillion in surface films, in contrast to some earlier high concentrations found in Biscayne Bay. Surface film analysis limitations imposed by sampling methods are discussed. Plankton in slick, non-slick, and subsurface water were counted. Populations were higher in surface than subsurface water, and higher in non-slick than in slicked surface water. (EPA)

RADIOLOGICAL ENVIRONMENTAL MONITORING--THE EPA APPROACH,
Office of Radiation Programs, Washington, D.C.
W. D. Rowe.
IEEE Transactions on Nuclear Science, Vol NS-21, No 1, p 416-422, February, 1974. 6 fig, 3 tab, 9 ref.

Descriptors: *Monitoring, *Radiation, Model studies, Instrumentation, Local governments, Costs.
Identifiers: Environmental radiation doses.

The approach of the Environmental Protection Agency to monitoring is discussed, with emphasis on dose computation utilizing source data, environmental models, and minimal monitoring for validation. This approach, which requires extensive use of models to predict dose and minimal environmental measurements, is expected to be more cost effective than the conventional approach. The need for monitoring at the state and/or local level is primarily to enforce standards and to obtain timely and effective data upon which emergency response decisions can be based. The EPA approach to radiological environmental monitoring will require the development and use of instrumentation which provides the data to implement this approach in the most cost effective manner. (Merritt-FIRL)

THE NEED FOR AN INDICATOR VIRUS IN WATER QUALITY TESTING,
Water Pollution Control Federation, Washington, D.C. Technical Services.
E. DeMichele, G. W. Burke, Jr., and M. S. Shane.
Water and Sewage Works, Vol 121, No 4, p 39, April, 1974.

Descriptors: *Water quality, *Viruses, *Bioindicators, Water analysis, Water pollution, Testing, Public health.

Water quality problems are discussed and the need for an indicator virus in water quality testing is proposed. The validity of the coliform test as an indicator of potential pathogenic microbial water pollution is being increasingly questioned. The fact that laboratory studies have shown enteroviruses to be more resistant to normal water and waste water chlorination practices than organisms of the coliform group lends justification to the hypothesis that coliform counts may not adequately monitor viral infection of water. The main problem is knowing the viruses exist, but being unable to measure them accurately or knowing which, if any, might cause infection. A test procedure for an indicator virus is proposed to be developed in a manner paralleling the use of E. coli as an indicator bacterium. The procedure should provide a rational means of measuring treatment efficiency in terms of human health and well being. It is not necessary that the virus be pathogenic, but rather, it should be similar to infectious viruses in terms of make up, tolerance, and stability. (Merritt-FIRL)
W74-08880

DETECTION SYSTEMS FOR THE LOW LEVEL RADIOCHEMICAL ANALYSIS OF IODINE-131, IODINE-129 AND NATURAL IODINE IN ENVIRONMENTAL SAMPLES,
Battelle-Pacific Northwest Labs., Richland, Wash.
F. P. Brauer, and J. H. Kaye.
IEEE Transactions on Nuclear Science, Vol NS-21, No 1, p 496-502, February, 1974. 10 fig, 1 tab, 25 ref.

Descriptors: *Iodine radioisotopes, *Neutron activation analysis, *Separation techniques, *Oxidation, Gamma rays, Spectrometers, Measurement, *Pollutant identification.

A procedure based on chemical separation techniques and activation analysis has been developed for the sequential analysis of low levels of I131, I129, and natural iodine in environmental samples. The iodine is first separated from the samples by oxidation. The separated iodine is then counted by low level, beta-gated gamma-ray spectrometry for the measurement of I131. The chemical yield for the separation is measured by means of I125 tracer. Activation analysis is used for measurement of the separated natural iodine, I127 and I129. The natural iodine is estimated from either the I126 or I128 activity produced in the sample. The induced I130 is used to estimate the I129 concentration. Measurements have been made of iodine radioactivity in the environment at concentrations below the limits established for radiation protection purposes. (Merritt-FIRL)

GE(LI) LOW LEVEL IN SITU GAMMA-RAY SPECTROMETER APPLICATIONS,
California Univ., Livermore. Lawrence Livermore Lab.
P. L. Phelps, L. R. Anspaugh, S. J. Roth, G. W. Huckabay, and D. L. Sawyer.
IEEE Transactions on Nuclear Science, Vol NS-21 No 1, p 543-552, February 1974. 8 fig, 4 fig, 10 ref.

Descriptors: *Spectrometers, *Radioisotopes, *Soils, Measurements, Methodology, Liquid wastes, Gases, Effluents, Analytical techniques, *Pollutant identification, *Nevada.
Identifiers: *Ge(Li) spectrometer.

The application of a Ge(Li) spectrometer for in-situ measurements of radionuclides contained in soil is described. This is being done at nuclear reactor sites and in complex radionuclide fields at the Nevada Test Site. The methodology and precision of the in-site spectrometer technique has previously been established for analysis of radionuclides in soil. Application of the technique to gaseous and liquid effluents containing radionuclides has shown a great deal of promise. (Merritt-FIRL)
W74-08886

COMPARISON OF GE(LI) AND ANTICOMPTOM SYSTEMS FOR MEASUREMENTS OF ENVIRONMENTAL SAMPLES,
Battelle-Pacific Northwest Labs., Richland, Wash.
N. A. Wogman.
IEEE Transactions on Nuclear Science, Vol NS-21, No 1, p 526-535, February, 1974. 17 fig, 2 tab, 21 ref.

Descriptors: *Spectrometers, *Gamma rays, *Radioisotopes, Measurements, Equipment, Evaluations, *Pollutant identification.
Identifiers: *Ge(Li) spectrometers, NaI(T1) spectrometers.

A variety of sensitive low level counting systems are discussed from an analyst's viewpoint, centering on a variety of NaI(T1) and Ge(Li) gamma ray spectrometers. The coincident gamma ray emitters are most sensitively detected through NaI(T1) multi-dimensional gamma ray spectrometry, while single gamma ray emitters are very sensitively detected with Ge(Li) detector systems. NaI(T1) detector systems are superior in general for environmental measurements. (Merritt-FIRL)

A GAMMA-RAY SPECTRUM ANALYSIS TECHNIQUE FOR LOW-LEVEL ENVIRONMENTAL RADIONUCLIDES,
Emory Univ., Atlanta, Ga. Dept. of Physics.
R. E. Wood, and J. M. Palms.
IEEE Transactions on Nuclear Science, Vol NS-21, No 1, p 536-542, February, 1974. 5 fig, 1 tab, 4[illegible] ref.

Descriptors: *Spectrometers, *Gamma rays, *Analytical techniques, Measurements, *Radioisotopes, Reviews, Equipment, *Pollutant identification.
Identifiers: *Ge(Li) spectrometer.

The requirements for gamma-ray spectra analysis for low level environmental radionuclides are reviewed. Special emphasis is placed on the routine and rapid analysis of large numbers of samples. Pertinent requirements for analysis include the system energy and efficiency calibration, the library of gamma rays of concern, criteria of establishing the limits of sensitivity, and techniques used for gamma ray intensity and background determinations. An analysis code (CETUS) used with a Ge(Li) detector and multichannel analyzer interfaced to a programmable desk top calculator is described. (Merritt-FIRL)

METHOD AND APPARATUS FOR DETERMINING POLLUTION INDEX,
Environmental Devices Corp., Marion, Mass (assignee)
E. C. Brainard, II.
U.S. Patent 3,807,860. Official Gazette of the U.S Patent Office, Vol 921, No 5, p 1986, April 30 1974. 1 fig.

Descriptors: *Patents, Water pollution Methodology, Equipment, Saline water, *Salinity *Refractivity, *Pollutant identification *Electrical conductivity.
Identifiers: *Pollution index.

A method and apparatus for providing an index of the concentration of pollutant in water is described. The index is determined according to the difference between two different measures of the salinity of water. In a preferred embodiment the two measures of salinity are measures of electrical conductivity and of refractive index. (Merritt-FIRL)

SEDIMENTARY FLUORITE IN TAMPA BAY, FLORIDA,
University of South Florida, Tampa, Fla. Dept. of Geology.
W. H. Taft, and D. F. Martin.
Environmental Letters, Vol 6, No 3, p 167-174, 1974. 4 ref.

Descriptors: *Water sampling, *Sampling, *Sediments, Analytical techniques, Estuaries, *Fluoride, Sea water, Temperature, Hydrogen ion concentration, *Florida.
Identifiers: *Tampa Bay(Fla), *Fluorite.

Water and sediment samples were collected at eight sites in Tampa Bay adjacent to the southernmost discharge canal of an industrial company, Gardinier, Incorporated. Water samples were frozen within 4 hours of collection and sediment samples were dried and prepared for x-ray diffraction. The results show: the existence of sedimentary fluorite; remarkably low pH meter readings which indicate the buffering capacity of 12 acre meters of estuarine water was virtually exhausted; the fluoride concentration is as much as 40 times its concentration in normal sea water, undoubtedly because of the complexing by hydrogen ions and silicon; and the temperature differentials in such relative shallow water are not only significant, but are the inverse of what would normally be expected. (Merritt-FIRL)
W74-08907

AN AIRBORNE GAMMA RAY SPECTROMETER AND ITS APPLICATION IN NUCLEAR POWER PLANT SITE SURVEYS,
Rice Univ., Houston, Tex.
G. E. Fryer, and J. A. S. Adams.
IEEE Transactions on Nuclear Science, Vol NS-21, No 1, p 572-584, February, 1974. 8 fig, 4 tab, 15 ref.

Descriptors: *Nuclear powerplants, *Gamma rays, *Spectrometers, *Remote sensing, Monitoring, Air pollution, Radioactivity, Measurements, *Texas, Instrumentation, Surveys, Flooding.
Identifiers: Thermoluminescence dosimeters, Helicopters.

Airborne radiometric surveys from low flying helicopters have been completed for three nuclear power plant sites in Texas. The gamma ray counting data acquired in the air are converted to ground dose rate and plotted as a series of profiles. A radial flight line pattern provides easy position control and concentrates sampling density over the plant site. The 5-8 fold range of natural and man made radiation background within 10 miles of the three plant sites is statistically well characterized by over 14,000 spectra taken directly from 3.8% of each 314 sq mi survey area. The aerial dose estimates agree closely with thermoluminescence dosimeter data taken on the ground over 3 mo periods. The instrumentation system, survey rationales, data reduction, and analysis procedures are described. One of the major complications of the area is the periodic and extensive flooding of the rice fields, attenuating the gamma ray flux from the ground. (Merritt-FIRL)

ENVIRONMENTAL DOSE MEASUREMENTS IN THE VICINITY OF NUCLEAR FACILITIES,
duPont de Nemours (E.I.) and Co., Aiken, S.C. Savannah River Plant.
R. M. Hall, Jr., and D. I. Ross.
IEEE Transactions on Nuclear Science, Vol NS-21, No 1, p 451-455, February, 1974. 6 fig, 1 tab, 6 ref.

Descriptors: *Monitoring, *Nuclear powerplants, *Radiation, Measurements, Radioactivity, Instrumentation, Filters, *South Carolina.
Identifiers: *Savannah River Plant(So.Car.), *Dosimeters, Dosimetry systems.

The environmental radiation monitoring program for the Savannah River plant was recently altered to make more detailed readings at more locations in the plant's environs. Monitoring stations were increased from 40 to about 500. Additional stations were selected to improve the delineation and measurement of natural radiation. Monitoring stations near each operating area were supplemented by additional stations near effluent streams and at one mile intervals along the plant perimeter. Thirty fire towers within a 50 mile radious of the plant are used to place monitors up to 80 ft above the ground to aid in distinguishing between airborne and terrestrial radioactivity. Most measurements are taken quarterly, but several locations are measured biweekly to detect short term variations. (Merritt-FIRL)

INVESTIGATION OF THE CHEMICAL IDENTITY OF SOLUBLE ORGANOPHOSPHORUS COMPOUNDS FOUND IN NATURAL WATERS,
Illinois Inst. of Tech., Chicago. Dept. of Environmental Engineering.
R. A. Minear, and K. A. Walanski.
Available from the National Technical Information Service as PB-232 972; $3.75 in paper copy, $1.45 in microfiche. Illinois Water Resources Center, Urbana, Research Report No 86, May 1974. 71 p, 25 fig, 12 tab, 53 ref, OWRR A-060-ILL(1). 14-31-0001-3813.

Descriptors: *Pollutant identification, Cultures, Algae, *Phosphorus compounds, *Organophosphorus compounds, Chemical analysis, Water analysis, Aqueous solution.
Identifiers: Organic phosphorus, Algal soluble organics, *Inositol phosphates, Sephadex, Gel filtration.

The ability of various laboratory algal cultures to generate substantial quantities of dissolved organic phosphorus (DOP) compounds has been demonstrated. After isolation and concentration of these compounds by low pressure filtration, freeze drying and redissolution, molecular size profiles on Sephadex gels were obtained. Comparison between DOP and inositol phosphate profiles on Sephadex G-25 prompted specific studies for the presence of inositol phosphates in the culture solutions. Alkaline bromination techniques established in soil chemistry research were employed in conjunction with Sephadex gel filtration to generate cicumstantial evidence for the presence of inositol monophosphate and the absence of inositol hexaphosphate. The results obtained in conjunction with preliminary volatile derivative studies have provided the base for continued studies on the specific chemical nature of DOP compounds in aqueous systems.

Davidson Coll., Biology Div.
Available from NTIS, Springfield, Va, as Rept No K-L-6119; $4.00/copy, $1.45/microfiche. Report No K-L-6119, September 1966. 23 p, 5 fig, 5 ref. (Also presented at the Symposium on the Capacity of Streams to Assimilate Wastes, 152nd Annual Meeting of the America Chemical Society, New York, September 1966.

Descriptors: *Natural streams, Freshwater, Water pollution, Water pollution treatment, Water quality control, *Radioactive wastes, Nuclear wastes, Centrifugation, Coagulation, Water purification, Limnology, Biology, Sediment load, *Pollutant identification, *Separation techniques.

Qualitative and quantitative fractionation of the various organic and inorganic species of particles occuring in natural water is a prerequisite to investigations of cycling of biologically or surface active contaminants in the aquatic biosphere. With the increasing release of these contaminants coinciding with increasing reuse of water, interest is developing in means of assessing the possible biohazard the contaminants may present. The suspended and colloidal sized organic particles typically found in natural water are emphasized, although the same theories and general methods apply to similar particles in other fluids and to inorganic particles. Generally, centrifugal methods are not practical for particles with a molecular weight of less than 10 to the sixth power and a sedimentation rate of less than 10S when dealing with large volumes of fluid. (Houser-ORNL)

RADIOLOGICAL SURVEILLANCE AROUND TURKEY POINT, 1970-1971,
Florida State Div. of Health, Jacksonville. Radiological and Occupational Health Section.
W. Johnson, and J. Eakins.
Radiation Data and Report, Vol 15, No 3, p 105-115, March 1974. 2 fig, 23 tab, 3 ref.

Descriptors: *Monitoring, *Nuclear powerplants, *Background radiation, Radioactivity, Environment, Air, Water, Local precipitation, Soil analysis, Soil contamination, Water pollution, Ocean water, Fresh water, Vegetation, Aquatic animals, Aquatic plants, Ecology, Algae, Crustaceans, Grasses, Fish, Food chains, *Florida.
Identifiers: *Surveillance program, Preoperational, *Turkey Point(Fla).

Prior to the operation of the Turkey Point Nuclear Power reactor, environmental media were sampled and data are presented for 1970-1971. Basic media investigated include air, precipitation, soil, silt, and water, including sea water. A number of media utilized as indicator organisms serve to investigate the behavior of radionuclides in several ecological levels. Indicators are mangrove vegetation, fresh water algae, turtle grass and sponges. Additional items found in the human food chain that were analyzed include crustacea, fish, and food crops. Data on the analysis of the various samples are given. (Houser-ORNL)

Environmental Protection Agency, Washington, D.C.
Radiation Data and Reports, Vol 15, No 3, p 129, March 1974. 1 fig, 2 tab, 4 ref.

Descriptors: *Monitoring, *Sampling, *Analytical techniques, *Assay, *Radioactivity, *Water pollution, Ground water, Water pollution treatment, Water quality, Surface water, Water quality standards, Domestic water, Potable water.
Identifiers: *Surveillance program, Gross beta, Gross alpha.

Information is provided by Federal, State, and foreign governmental agencies and other cooperating organizations. Data reported are accumulated from surveillance programs concerning radionuclide concentrations of surface, ground, and treated water. Most of the analytical determinations are for gross beta and gross alpha radioactivity. These values are compared with the Public Health Service Drinking Water Standards. (Houser-ORNL)

MONITORING FOR TRACE METALS--WATER ENVIRONMENT,
National Environmental Research Center, Cincinnati, Ohio.
D. G. Ballinger.
In: Cycling and Control of Metals; Proceedings of Environmental Resources Conference, October 31-November 2, 1972, Columbus, Ohio: Environmental Protection Agency National Environmental Research Center, p 145-148, February 1973. 1 tab, 10 ref.

Descriptors: *Monitoring, *Trace elements, *Water pollution control, Water pollution sources, *Path of pollutants, Water analysis.

Monitoring for trace metals in the aquatic environment involves source and near-source sampling, as well as ambient monitoring for baseline data and trend analysis. A number of satisfactory analytical methods are available and in use to determine metals in water and waste samples. Good laboratory quality is essential to the monitoring program, and various manuals and reference samples are available from EPA to assist in establishing and maintaining efficient laboratory operations. (See also W74-09206) (Knapp-USGS)
W74-09215

MONITORING OF SOLID WASTES,
Michigan Univ., Ann Arbor.
E. A. Glysson.
In: Cycling and Control of Metals; Proceedings of Environmental Resources Conference, October 31-November 2, 1972, Columbus, Ohio: Environmental Protection Agency National Environmental Research Center, p 149-152, February 1973. 6 ref.

Descriptors: *Monitoring, *Trace elements, *Solid wastes, Landfills, Waste dumps, Water pollution sources.

Monitoring of solid wastes in general is far from adequate and for trace metals is hardly considered. More must be learned of the importance of trace metals from solid wastes upon the quality of the environment. Studies to date have not indicated that trace metals are a problem from this source, but more work needs to be done. (See also W74-09206) (Knapp-USGS)

THE USE OF ION SPECIFIC ELECTRODES FOR CHEMICAL MONITORING OF MARINE SYSTEMS: PART I--THE AMMONIA ELECTRODE AS A SENSITIVE WATER QUALITY INDICATOR PROBE FOR RECIRCULATING MARICULTURE SYSTEMS,
Delaware Univ., Newark. Coll. of Marine Studies.
R. F. Srna, C. Epifanio, M. Hartman, G. Pruder, and A. Stubbs.
Available from NTIS, Springfield, Va 22151 as COM-73-11644, price $2.75 printed copy; $1.45 microfiche. Report DEL-SG-14-73, June 1973. 20 p, 4 fig, 4 tab, 4 ref. NOAA Grant 2-35223.

Descriptors: *Monitoring, *Ammonia, *Aquiculture, *Electrodes, Water chemistry, Water analysis, Sea water, Nutrients, Respiration, Water quality.

The ammonia ion specific electrode was tested as a water quality probe in recirculating mariculture systems. Its precision and ease of use make it

possible for the ammonia level in the system to be monitored routinely and the ammonia concentration used as a master variable, to detect rapid system changes involving both physical and biological perturbations. (Knapp-USGS)
W74-09220

HIGH-RESOLUTION ANALYSES OF REFRACTORY ORGANIC CONSTITUENTS IN AQUEOUS WASTE EFFLUENTS,
Oak Ridge National Lab., Tenn.
R. L. Jolley, W. W. Pitt, Jr., and C. D. Scott.
Available from NTIS, Springfield, Va. 22151 as CONF-730401-3 - Price $3.00 printed copy; $1.45 microfiche. 1973. 23 p, 6 fig, 2 tab, 16 ref.

Descriptors: *Chemical analysis, *Organic matter, *Waste water(Pollution), *Pollutant identification, *Chromatography, *Anion exchange, Flame photometry, Spectrophotometry.

Organic contaminants in domestic sanitary waste treatment plant effluents may be analyzed using high-resolution analytical systems developed at the Oak Ridge National Laboratory. These analyzers utilize high-pressure, anion exchange chromatography for separation of molecular-constituents in effluent concentrates. The separated compounds are detected using UV-photometry, cerate oxidimetry, or phenol-sulfuric acid colorimetry for UV-absorbing, oxidizable, or carbohydrate constituents respectively. Over 100 constituents are separated and detected from a typical domestic primary sewage treatment plant effluent. More than 50 constituents are separated from a typical domestic secondary sewage treatment plant effluent; of these, 9 were identified and 8 quantified. Preliminary results using the analyzers to study the effects of chlorination on sewage effluents indicate that several stable chlorinated organic residuals are formed during chlorination. (Knapp-USGS)

CHEMICAL COMPOSITION OF WATER SUPPLIES TO NAVAL AND MARINE CORPS AIR STATIONS,
Naval Air Development Center, Warminster, Pa. Materials Engineering Section.
W. C. Hallow.
Available from NTIS, Springfield, Va. 22151 as AD-757 335 - Price $3.00 printed copy; $1.45 microfiche. Report No NADC-72260-VT, December 1972. 14 p, 5 fig, 5 tab, 3 ref.

Descriptors: *Water quality, Aircraft, *Airports, *Military reservations, *Water supply, *Dissolved solids, *Chlorides, Texas, California, Treatment facilities.
Identifiers: Aircraft wash-water.

A survey was made of the quality of water supplies at Naval and Marine Corps Air Stations both within the United States and overseas to aid in the design and location of new water rinse facilities for aircraft. In addition to the total dissolved solids (TDS) and chloride content, each water analysis includes the pH, carbonate and noncarbonate hardness, and the concentration of several ions found in the water. Only two factors, the TDS and the chloride concentrations, need to be considered in determining if a water supply is suitable for rinsing aircraft. Eleven air stations in Texas and in southern California report high TDS and chloride concentrations. Five of the 13 overseas stations reported have high TDS and chloride concentrations. The water supply at overseas stations is generally comparable to stations within the Continental United States. (Knapp-USGS)

AERIAL RADIOLOGICAL MEASURING SURVEY OF THE AREA SURROUNDING THE DRESDEN NUCLEAR POWER STATION, MORRIS, ILLINOIS, SEPTEMBER 1968,
EG and G, Inc., Las Vegas, Nev.
P. K. Boyns, and M. D. Sevart.
Available from NTIS, Springfield, Va., as ARMS 68.6.8; $5.45 per copy, $1.45 microfiche. Report No ARMS-68.6.8, December 1973. 79 p, 60 fig, 5 tab.

Descriptors: *Nuclear powerplants, *Monitoring, *Surveys, Assay, Environment, Air pollution, Water pollution, Soil contamination, Fallout, Effluent, Rivers, Marshes, Remote sensing, Meteorology, *Illinois, *Remote sensing.

The Aerial Radiological Measuring System (ARMS), operated for the U.S. Atomic Energy Commission, was used to perform surveys of several operational and non-operational reactor sites during the summer months of 1968. The data collected on these surveys included aerial photographs of the installations. Aerial radiation survey data includes exposure rates normalized to 3 feet above the ground plus gamma ray spectral charts, effluent characterization for operational sites (intensity rates and isotope constituents), and pertinent descriptive information of the installation. This report contains the data for the survey of the Dresden Nuclear Power Station and surrounding area, including an effluent plume track. (Houser-ORNL)

5B. Sources Of Pollution

DECHLORINATION OF DDT BY AEROBACTER AEROGENES,
Bureau of Sport Fisheries and Wildlife, Denver, Colo. Fish-Pesticide Research Lab.
G. Wedemeyer.
Science, Vol 152, No 3722, p 647, April 29, 1966.

Descriptors: *Biodegradation, Pesticides, Bacteria, *DDT, *DDD, Oxygen requirements, Metabolism, Inhibition, Iron, *Pesticide residues.
Identifiers: *Dechlorination, *Aerobacter aerogenes.

Dechlorination of DDT to DDD in higher animals requires the presence of molecular oxygen, but in microorganisms the presence of oxygen hinders dechlorination. In cell-free preparations of Aerobacter aerogenes, the use of selected metabolic inhibitors indicated that reduced Fe(11) cytochrome oxidase was responsible for DDT dechlorination. This finding may possibly explain the persistence of DDT residues in soils and sediments.

SALINITY PROBLEMS OF THE SAFFORD VALLEY: AN INTERDISCIPLINARY ANALYSIS,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
A. B. Muller.
In: Hydrology and Water Resources of Arizona and the Southwest, Proceedings of the 1973 meetings of the Arizona Section-Amer. Water Resources Assn., and the Hydrology Section-Arizona Academy of Science, Tucson, p 136-144, (1973). 5 fig, 9 ref.

Descriptors: *Salinity, *Water quality, *Leakage, *Agricultural runoff, *Crop production, Cotton, Alfalfa, *Arizona, Aquifer systems, Artesian aquifers, Deep wells, Salts, Salt tolerance, Water pollution sources, Irrigation water, Water quality control.
Identifiers: *Safford Valley(Ariz).

A change in groundwater quality, averaging approximately +0.129 millimhos electrical conductivity and +35 ppm chloride per year, has been documented between 1940 and 1972 with data from 10 long-term sample wells in the Safford Valley of southeastern Arizona. Decrement of water quality of the surficial aquifer can be attributed to 4 major mechanisms: An increase in salinity because of saline water leakage from the artesian aquifer, stimulated by pumping-caused reduction of confining pressure and by the puncture of the cap beds by deep wells; Water reaching the aquifer from natural recharge, if passed through soluble beds; Lateral movement of water through similar deposits, as well as Concentration and infiltration of agricultural water. An economic analysis of the area, based on modeling of representative farm units and projected salinity trends for a significant time beyond the limits of prediction, shows that cotton will remain an economic crop but that alfalfa will no longer be grown by 2040. Methodology described indicates low pumping influences salinity changes. Salinity controls for the area are outlined. (Muller-Arizona)

HOUSEHOLD WASTEWATER CHARACTERIZATION,
Baxter and Woodman, Inc., Crystal Lake, Ill.
K. Ligman, N. Hutzler, and W. C. Boyle.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 100, No EE1, p 201-213, February 1974. 9 tab, 46 ref.

Descriptors: *Waste water, *Surveys, *Suspended solids, *Waste disposal, Sampling, Domestic wastes, Biochemical oxygen demand, Water quality, *Pollutant identification.

The types of waste waters generated in a domestic household and their respective waste water characteristics were defined through the use of a waste water generation survey, a waste water sampling survey, and literature reviews. Based on data collected, a simulated waste loading was adopted for use in waste water treatment and disposal studies. The average four person household uses 190 gallons of water a day generating 0.695 lb/day BOD5 and 0.797 lb/day of suspended solids. Current research efforts employing this simulated waste water loading will define the limitations and operational requirements of given unit processes to meet a requisite water quality for ultimate disposal. (Merritt-FIRL)

THORIUM ISOTOPE CONTENT IN RIVER WATER IN JAPAN,
Meteorological Research Inst., Tokyo (Japan).
Y. Miyake, Y. Sugimur, and T. Yasujima.
Papers in Meteorology and Geophysics, Vol 24, No 1, p 67-73, March 1973. 1 fig, 6 tab, 6 ref.

Descriptors: Rivers, *Isotope studies, *Radioisotopes, *Radioactive wastes, Investigations, Analysis, Analytical techniques, Water pollution.
Identifiers: *Japan, *Thorium.

The concentrations of thorium isotopes Th232, Th230, and Th238 were determined in the river water collected at 10 main rivers in Japan. The concentration of dissolved Th232 in river water was one order of magnitude higher than that in the Pacific surface waters. The weighted averages were 2.7 times 10 to the minus 8th power g/liter for Th232 and 2.8 times 10 to the minus 13th power g/liter for Th230. The constancy in Th232 and Th230 concentration with time was observed, but the concentration of Th238 in river water was quite variable. Accordingly, the Th238/Th232 activity ratio showed a wide range of variations from 37 to 0.65 during the period of study. (Merritt-FIRL)

FACTORS AFFECTING THE PERSISTENCE OF PESTICIDES IN THE SOIL,
Rothamsted Experimental Station, Harpenden (England).
C. A. Edwards.
Chemistry and Industry, No 5, p 190-193, March 2, 1974. 1 fig, 48 ref.

Descriptors: *Insecticides, *Soil contamination, Soil chemical properties, *Soil management, Soil environment, Temperature, Rainfall, Soil moisture, Soil physical properties, Soil types, *Pesticide residues, *Path of pollutants.

The factors that influence the persistence of organochlorine insectides in soil can be separated into chemical, soil, environmental, and human factors. Under chemical characteristics the most important factor is the intrinsic stability of the chemical with the solubility of the pesticide being of considerable influence. Soil type and particle size as well as the amount of organic matter in a soil greatly affect how long the insecticide will remain. The most important environmental factors include temperature, rainfall, and soil moisture. Factors such as cultivation, weathering of the soil surface, and plant selection can influence the persistence of insecticides relative to the management of the soil. (Sandoski-FIRL)

CONTENT OF PLUTONIUM IN RIVER WATER IN JAPAN,
Meteorological Research Inst., Tokoyo (Japan).
Y. Miyake, Y. Sugimura, and K. Saruhashi.
Papers in Meterology and Geophysics, Vol 24, No 1, p 75-78, March, 1973. 1 fig, 1 tab, 6 ref.

Descriptors: Rivers, *Radioactive wastes, Fallout, Water pollution, Investigations, Waste disposal, Water pollution sources.
Identifiers: *Japan, *Plutonium.

The content of plutonium in the water of eight main rivers in Japan was determined. The average value of the total content of plutonium is 0.0014pCi/liter in which .0004 pCi/liter is contained in the suspended matter. The annual runoff plutonium is only 0.12% of the accumulated plutonium on land. This suggests that the fallout plutonium is firmly adsorbed on soil surface and is difficult to leach out. (Merritt-FIRL)

SIMULATION OF DISSOLVED OXYGEN PROFILE,
Worcester Polytechnic Inst., Mass. Dept. of Mathematics.
G. C. Sornberger, and K. Keshavan.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 99, No EE4, Paper 9943, p 479-488, August 1973. 3 fig, 6 ref, append. OWRR C-3027(3674)(2).

Descriptors: *Dissolved oxygen, *Oxygen demand, *Simulation analysis, Mathematical models, Oxygen sag, Stochastic processes, *Thermal pollution, *Path of pollutants, Variability.

A stochastic mathematical model describes the probability distribution of dissolved oxygen in streams which have received an input of both thermal and organic pollution. The stochastic model is siumlated under conditions of constant and variable temperature, and the results of the simulation are compared with the mean values predicted by recent deterministic models. The simulation provides an estimate of the variability in the DO level to be expected at different points as well as a means of generating typical oxygen sag curves for a stream. (Knapp-USGS)

NITROGENOUS COMPOUNDS IN THE ENVIRONMENT.
Environmental Protection Agency, Washington, D.C. Hazardous Materials Advisory Committee.
Copy Available from GPO Sup Doc, $2.20; microfiche from NTIS as PB-232 959 $1.45. Environmental Protection Agency Report EPA-SAB-73-001, December 1973, 187p.

Descriptors: *Feed lots, *Waste water treatment, Landfills, Ecology, Water pollution, Water pollution effects, *Water pollution control, Groundwater, Run-off, Urban areas, Sewage, Industrial wastes, Sanitary engineering, Air pollution, Nitrites, *Nitrogen compounds, Fertilizers, Wastes, Food supply, *Farm wastes.
Identifiers: Sanitary landfill leachate, Nitrosamines.

This report is a series of papers on the sources and methods of control and the environmental and health effects of nitrogenous compounds. Diverse aspects of municipal and industrial sources are discussed--waterborne, atmospheric, agricultural, and industrial processes generating nitrogenous compounds. Attention is given to nitrogenous materials in waste and surface waters, efficiency of sewage treatment, effectiveness of the conventional BOD test, and the contribution of urban runoff and landfill leakage to the overall nitrogen load in the environment. Concentrations, sources, sinks, the transformation of nitrogenous materials in the lower atmosphere, control measures for stationary and mobile sources, retrofit systems for used cars, and new engine systems are reviewed. Plant nutrients, including fertilizers, and animal wastes are considered. The growing problems resulting from concentrated centralized livestock feedlots and methods of control are pointed out. Nitrogen is discussed as a nutrient essential to living organisms and as a toxicant within the aquatic environment. The carcinogenicity of nitrosamines and their precursors is described as a potential danger to health. Individual nitrogenous compounds are appropriately identified through the report. Analytical procedures for the identification and quantification of nitrogenous compounds are reviewed. Presented are the major concerns regarding nitrogenous compounds in the environment as these related to the following Environmental Protection Agency activities: research, monitoring, and regulation. (Malone-EPA)
W74-08835

LARGE-SCALE MASS BALANCE FOR LEAD IN SOUTHERN LAKE MICHIGAN,
Illinois Univ., Chicago. Dept. of Energy Engineering.
A. C. Cogley.
Available from the National Technical Information Service as PB-232 956 $3.00 in paper copy, $1.45 in microfiche. Illinois University, Urbana, Water Resources Center Research Report No 85, December 1973. 18 p, 1 fig, 1 tab, 20 ref. OWRR A-057-ILL (1), 14-31-0001-3813.

Descriptors: *Lake Michigan, *Aerosols, *Lead, Air pollution, *Path of pollutants, *Illinois, Dispersion, Model studies, Turbulet boundary layers.
Identifiers: *Mass-balance(Lead), *Atmospheric transport, Chicago area(Ill.)

A large-scale, order-of-magnitude mass balance for lead in the near field of Chicago (the source) is presented. Both experimental data and simple physical modeling are used to estimate the transport of lead from the major sources to the near-field sinks of Southern Lake Michigan, its watershed soil, and the surroundings (losses from the system under question). The results show that atmospheric transport of lead aerosols to a sink like Lake Michigan is about two orders of magnitude greater than other transport mechanisms. To perform a detailed (small-scale) mass balance for lead, in support of the large-scale results, a complete model of atmospheric, aerosol transport and deposition is necessary and dominant. Although much work has been done on (free) turbulent dispersion of aerosols and aerosol diposition through precipitation, little is known about the dry deposition of aerosols from a turbulent boundary layer. An aerosol, turbulent dispersion model with a realistic boundary condition at the fluid-ground interface needs to be developed. A coordinated experimental program for measuring (dry) aerosol flux to the ground (and Lake) should be initiated.
W74-08836

NITROGEN: A PROBLEM OF DECREASING DILUTION,
Imperial Coll. of Science and Technology, London (England). Dept. of Mathematics.
R. Scorer.
New Scientist, Vol 62, No 895, p 182-184, April 25, 1974. 2 fig.

Descriptors: *Nitrogen, Rivers, *Nitrates, Human populations, Environmental effects, Potable water, Water pollution sources.
Identifiers: Nitrogen pollution, *Thames River(U.K.), Lee River(U.K.), United Kingdom.

Nitrogen pollution levels in the Thames and Lee rivers in Great Britain have risen due to population pressures. Drinking water must be kept under 11.3 mg of nitrogen per liter in order to be potable for babies. Adult limits are about 20 mg nitrogen per liter. The use of river water in towns and the population served by sewage works have both increased. An additional problem is warm winters, such as 1973-1974, where a greater fraction of the waste became nitrate, rather than going into the air as ammonia. (Prague-FIRL)
W74-08864

ENVIRONMENTAL PROTECTION AND ENERGY CONSERVATION GO HAND-IN-HAND.
Coal Age, Vol 79, No 4, p 113-116, April, 1974. 2 fig, 2 tab.

Descriptors: *Energy, *Environmental effects, *Mining, Conservation, Industrial wastes, Air pollution effects, Standards.
Identifiers: *Environmental protection, Industrial pollution, Auto emissions standards.

Major energy-environmental interfaces and problems are discussed. Mining industries, especially base metal producers such as aluminum, copper, lead, zinc, are viewed by EPA as major sources of industrial pollution. The impact of new 'clean' energy sources is proposed. Auto emissions standards are a controversial issue, both for tuning up old cars and for the prohibitive consumer costs of anti-pollution devices for new models. Shifting patterns in electricity use and the need for energy conservation, including drastic changes legislated by Congress are also noted. (Prague-FIRL)
W74-08865

DETERMINING THE BIODEGRADABILITY OF ORGANIC COMPOUNDS.
Effluent and Water Treatment Journal, Vol 14, No 3, p 161, March, 1974.

Descriptors: *Instrumentation, *Oxygen demand, *Pollutants, *Organic compounds, *Biodegradation, Effluents, Water pollution control, Measurement, Surface waters, Industrial wastes, Pollutant identification.
Identifiers: *Organic carbon analyser, Model 915 TOC Analyser, Water pollution control plants.

Organic carbon in aqueous solution or suspension may be measured by catalytically oxidizing it to carbon dioxide, with a Model 915 TOC Analyser by Beckman Instruments. One application of the total organic carbon analyser is the determination of degradability of various organics by a given culture in the activated sludge treatment process. The process incorporates the aerobic oxidation of organic compounds to simple, harmless inorganics such as carbon dioxide, water, nitrates, sulphates, and cellular organic matter. Because widespread requirements for determining organic pollution of water are increasing, this measurement of organic carbonaceous matter as a major oxygen-demanding pollutant is important. Total organic carbon analyser measurement is rapid and produces duplicate results on duplicate samples. The process is applicable for measurement of effluents from water pollution control plants, industrial waste treatment plants, and the measurement of organics in surface waters. (Prague-FIRL)
W74-08867

BORON RELEASE FROM DEIONIZERS,
California Univ., Los Angeles. Dept. of Environmental Horticulture.
J. L. Paul, and W. F. Thornhill.
Industrial Water Engineering, Vol 11, No 1, p 6, January/February, 1974.

Descriptors: *Boron, *Toxicity, *Plant pathology, Water quality, *Irrigation, Ion exchange, Distillation.
Identifiers: *Deionized water.

The release of boron from deionized water and its pollution and toxicity effects are discussed. When water is used for irrigation, it is necessary to consider boron concentration in assessing water quality because boron is toxic to plants at 1 ppm or more in irrigation water. Deionized water, produced from a mixed bed unit, was used for irrigating greenhouse plants and scattered but recurring cases of boron toxicity were noted. Samples of deionized water collected just before and during breakthrough and analyzed for boron, pH, and electrical resistance showed that boron reached a maximum concentration of 15 mg/liter. Most plant species die if irrigated continually with this concentration. (Merritt-FIRL)
W74-08873

ENVIRONMENTAL RADIATION DOSE CRITERIA AND ASSESSMENT-PATHWAY MODELING AND SURVEILLANCE,
Brookhaven National Lab., Upton, N.Y. Health Physics and Safety Div.
A. P. Hull.
IEEE Transactions on Nuclear Science, Vol NS-21, No 1, p 491-495, February, 1974. 2 fig, 3 tab, 24 ref.

Descriptors: *Radiation, *Nuclear powerplants, *Safety, Nuclear physics, Radioactive wastes, Measurements, *Radioactivity, Monitoring, Nuclear reactors, *Path of pollutants.
Identifiers: *Environmental radiation doses.

The development of environmental radiation dose criteria and assessment through both pathway modeling and environmental surveillance are discussed. Considerable effort has been devoted to this end since the first utilization of nuclear reactors in the United States in the 1940's and particularly since the advent of civilian nuclear power reactors. The Atomic Energy Commission has issued a Safety Guide calling for considerable refinement in the measuring and reporting of effluents from nuclear power plants, and has only recently issued a counterpart dealing with the measuring and reporting of radioactivity in the environs of nuclear power plants. The EPA has also recently issued a guide for the surveillance of environmental radioactivity. Currently, power reactor operators are being required by the AEC Regulatory Staff to conduct detailed, sensitive environmental surveillance at levels consistent with proposed concentration limits. (Merritt-FIRL)
W74-08875

INSTRUMENTATION AND ENVIRONMENTAL RADIATION ASSESSMENT SYSTEMS,
Office of Radiation Programs, Washington, D.C.
C. E. Peters.
IEEE Transactions on Nuclear Science, Vol NS-21, No 1, p 470-477, February, 1974. 7 fig, 1 tab, 10 ref.

Descriptors: *Radiation, *Monitoring, *Instrumentation, Nuclear powerplants, *Surveys, Model studies, Water transfer, Radioisotopes.
Identifiers: Environmental radiation doses.

The field of radiation protection monitoring was surveyed and those applications requiring improved instrumentation or monitoring systems are identified. The application of most pressing concern are emergency response monitoring systems and systems to monitor the radiation exposure in the vicinity of nuclear power facilities. The increasing need for calculating the doses from sources of radiation exposure has generated two trends that may be of importance to the future development of nuclear instrumentation and/or monitoring systems. One trend is the increasing use of models, such as air and water transport models, to calculate the movement of radionuclides and subsequently the doses. The other trend is the increasing demand for specific radioncuclide concentration measurements, which can be used for calculating dose, rather than measurements of gross activity. (Merritt-FIRL)
W74-08876

DISTRIBUTION OF PHOSPHATES IN LAKE MARIUT, A HEAVILY POLLUTED LAKE IN EGYPT,
Alexandria Univ. (Egypt). Dept. of Oceanography.
M. A. H. Saad.
Water, Air, and Soil Pollution, Vol 2, No 4, p 515-522, December, 1973. 3 fig, 28 ref.

Descriptors: *Lakes, *Phosphates, *Distribution patterns, Seasonal, Investigations, Water pollution, *Environmental effects, Water pollution sources, *Path of pollutants.
Identifiers: *Egypt(Lake Mariut), Phosphate distribution.

Because of an increase in human population and industry around Lake Mariut, the lake has changed into a markedly eutrophic state. Severe pollution is mainly responsible for the decrease in the total fish production from 9,977,815 kg in 1961 to 1,490,600 kg in 1969. This lake continuously receives great amounts of untreated sewage and industrial wastes. Huge quantities of drainage waters rich in phosphate fertilizers enter the lake as well. The concentrations of phosphates are also increased by the liberation of autochthonous phosphates from the decomposition of massive amounts of dead phytoplankton and the stirring up of the bottom muds by wind action, which accelerates the release of adsorbed phosphates from the mineral particles. The phosphate values for Lake Mariut were several times higher than surrounding Egyptian lakes, due to the aforementioned factors. (Prague-FIRL)
W74-08881

WASTE ACCUMULATION ON A SELECTED DAIRY CORRAL AND ITS EFFECT ON THE NITRATE AND SALT OF THE UNDERLYING SOIL STRATA,
California Univ., Riverside. Dept. of Soil Science and Agricultural Engineering.
A. C. Chang, D. C. Adriano, and P. F. Pratt.
Journal of Environmental Quality, Vol 2, No 2, p 233-237, April-June, 1973. 5 fig, 3 tab, 9 ref.

Descriptors: *Water pollution sources, Animal wastes(Wildlife), *Leaching, Nutrient removal, *Dairy industry, Nitrogen, *Nitrates, *California, Soils, Salts.
Identifiers: *Chino-Corona(Calif).

A corral was selected from a typical Chino-Corona, California area dairy to study waste accumulation and distribution on corral surfaces and to determine its effect on underlying soil strata. Waste deposited on the surface tended to accumulate in a small area of the corral; as much as 57% of the waste was in an area equaling 30% of the total corral surface. Considerable decomposition of organic matter and nitrogen loss took place during accumulation; however, collected waste samples were relatively unstable and subject to further decomposition. After a long period of dairy operations, leaching of nitrates, chlorides, and organic matter into soils was substantial. The same order of magnitude of leaching of chloride and organic carbon occurred throughout the entire corral surface. The amount of nitrate underneath the area of heavy waste accumulation was less than that in the other part of the corral. Future improvement in dairy waste management should take this into consideration in order to minimize its potential cause of ground water pollution. (Skogerboe-Colorado State)

NUTRIENT BALANCES FOR THE EVALUATION OF NUTRIENT SOURCES IN WATER QUALITY MANAGEMENT,
Department of the Environment, Ottawa (Ontario). Water Quality Branch.
R. H. Peters.
Water Resources Bulletin, Vol 9, No 1, p 49-53, February, 1973. 2 fig, 3 tab, 1 ref.

Descriptors: *Water pollution sources, Water quality, Water quality control, *Nutrients, Riverflow, River systems, Leaching, *Canada, *Nitrogen, *Phosphorus, *Path of pollutants.
Identifiers: *Qu'Appelle River basin(Sask).

The methodology for a nutrient balance to evaluate the sources and distribution of nutrients in a small river basin is described. Loadings for total nitrogen and phosphorus are calculated from measured nutrient concentration and river discharge data. Using a special retrieval program and a data storage and processing system, loadings are accumulated over a given time period to allow for time of passage through the basin and seasonal changes in nutrient distribution. Nutrient balances are made with the accumulated loadings to obtain the relative contribution of each nutrient source and the retention of nutrients within the basin through sedimentation and aquatic growth. The methodology has been used to study nutrients in the Qu'Appelle River Basin, Saskatchewan, Canada. (Skogerboe-Colorado State)

DISTRIBUTION OF SELECTED TRACE METALS IN SOUTHERN LAKE MICHIGAN AND LOWER GREEN BAY,
Illinois Univ., Urbana. Dept. of Civil Engineering.
H. V. Leland, and N. F. Shimp.
Available from the National Technical Information Service as PB-232 971; $3.25 in paper copy, $1.45 in microfiche. Illinois Water Resources Center, Urbana, Research Report No 84, April 1974. 28 p, 9 fig, 3 tab, 24 ref. OWRR A-052-ILL(2). 14-31-0001-3213.

Descriptors: *Lake Michigan, *Heavy metals, *Trace elements, Sediment-water interfaces, *Path of pollutants, *Distribution patterns, *Lake sediments.
Identifiers: *Metal transport, Water-sample storage, Sediment-water interaction, *Green Bay, Trace metals.

The distribution of selected trace metals in water, suspended matter and sediments of southern Lake Michigan and in surficial sediments of lower Green Bay is described. Accumulations of As, Br, Cr, Cu, Hg, Pb, and Zn in fine-grained surficial sediments of southern Lake Michigan, apparently determined by patterns of sediment deposition, correlate closely with sediment concentrations of organic carbon and iron. Organic carbon concentrations of surficial sediments are more highly correlated with concentrations of Cu, Pb and Zn in surficial sediments of lower Green Bay than are either Fe of Mn contents. Mean concentrations of trace metals in suspended matter near the sediment-water interface of southern Lake Michigan equal or exceed amounts in surficial sediments. Horizontal (geographic) and vertical distributions of concentrations of nine trace metals (Cd, Cr, Co, Cu, Fe, Pb, Mn, Ni and Zn) in waters of southern Lake Michigan were examined during the period June-October, 1971. Distributions of Cu, Fe, Pb and Zn in filtered lake water are presented. Metal concentrations are typically highest near areas of industrialization and major tributary embouchment. Concentrations of Cu, Fe, Pb and Zn in nearshore areas of southern Lake Michigan are typically higher than concentrations in offshore waters, but this trend is inconsistent.
W74-08934

QUANTIFICATION OF POLLUTANTS IN AGRICULTURAL RUNOFF,
South Dakota State Univ., Brookings. Dept. of Civil Engineering.
J. N. Dornbush, J. R. Andersen, and L. L. Harms.
Copy Available from GPO Sup Doc as EP1.23:660/2-74-005, $1.90; microfiche from NTIS as PB-233 134, $1.45. Environmental Protection Agency, Technology Series Report EPA-660/2-74-005, February 1974. 149 p, 24 fig, 15 tab, 73 ref. EPA Project R800400. Contract 68-01-0030.

Descriptors: Surface runoff, *Agricultural runoff, Erosion, *Nutrients, Phosphorus, *Nonpoint pollution source, Chemistry, Sediments, *Water pollution sources, Pesticides, Bacteria, *South Dakota, Bioindicators, Rainfall, Snowmelt.
Identifiers: *Runoff pollutants.

Surface runoff from snowmelt and rainfall in eastern South Dakota was measured during a three year period. The size of the research sites ranged from 7.18 to 18.69 acres, and all sites had crops of corn, oats, pasture or hayland. Composite samples of the runoff were used for various chemical, physical and biological determinations. Runoff samples from 108 snowmelt events and 36 rainfall events were collected. Equipment fabrication and installation resulted in some incomplete data for the initial year, but successful monitoring of each runoff event was accomplished thereafter. Sediment losses were considerably lower than anticipated. Pesticide concentrations were low in both water and sediment samples, and were usually less than the analytical test limits. Coliform and fecal levels were consistently greater than accepted surface water quality criteria. Most of the nutrients were found to be soluble and/or associated with snowmelt runoff. (EPA)

DEVELOPMENT OF PREDICTIONS OF FUTURE POLLUTION PROBLEMS,
Battelle-Columbus Labs., Ohio.
J. E. Flinn, and R. S. Reimers.
Copy Available from GPO Sup Doc as EP1.23:600/5-74.005, $2.40; microfiche from NTIS as PB-233 117, $1.45. Environmental Protection Agency, Socioeconomic Studies Series Report EPA-600/5-74-005, March 1974. 207 p, 7 fig, 41 tab. EPA Program Element 1HA095. Contract 68-01-1837.

Descriptors: *Pollutants, Pollutant identification, Air pollution, *Water pollution sources, Strip mines, *Forecasting, Land use.
Identifiers: *Future pollution problems, Mine pollution, Toxic chemicals, Fine particulates, Radiation problems.

The report describes the results of a program to identify, rank and project short- and intermediate-term future pollution problems. Identification was accomplished using three independent search approaches based on industrial production, environmental, and societal trends and activity. Primary emphasis was placed on the environmental trends as gleaned from EPA, Battelle, literature, and other sources. An initial list of problems was compiled with specific stressors identified with each. Nine ranking factors were devised to select ten 'most serious' problems from the initial list. The factors included: persistence; mobility/pervasiveness; environmental, technological, social, and political complexity; physiological risk; research needs; and bulk or volume of the pollutant. The ten problems selected by this method were further ranked in order of relative importance. The ten selected problems in rank order are as follows: (1) Impacts of New Energy Initiatives; (2) Geophysical Modifications of the Earth; (3) Trace Element (Metal) Contaminants; (4) Proliferating Hazardous and Toxic Chemicals; (5) Emissions from New Automobile Fuels, Additives, and Control Devices; (6) Disposal of Waste Sludges, Liquids, and Solid Residues; (7) Critical Radiation Problems; (8) Fine Particulates; (9) Expanding Drinking Water Contamination; and (10) Irrigation (Impoundment) Practices. Five to ten year projections were made of the ten problems which resulted. (EPA)

HEALTH AND SAFETY LABORATORY FALLOUT PROGRAM -- QUARTERLY SUMMARY REPORT -- DECEMBER 1, 1973 THROUGH MARCH 1, 1974,
Health and Safety Lab. (AEC), New York.
E. P. Hardy, Jr.
Available: NTIS, Springfield, Va., as Rept. No. HASL-281, $7.60 per copy, $1.45 microfiche. Report No. HASL-281, April 1974. 277 p, 71 fig, 36 tab, 91 ref, 1 biblio.

Descriptors: *Monitoring, *Sampling, *Fallout, *Data collections, *Nuclear explosions, *Strontium, *Cesium, Air pollution, Water pollution, Soil contamination, Environment, Trace elements, Air, Milk, Diets, Food chains, Potable water, Assay, Public health.
Identifiers: Weapons testing, China, France, Stratosphere, *Concentration.

Current data are presented from the HASL Fallout Program and the Technical University of Wroclaw, Poland. The initial section of the report consists of interpretive reports and notes on the termination of aircraft sampling in the stratosphere; stratospheric radioactivity from Chinese and French nuclear tests; concentrations of Sr-90 and Cs-137 in environmental samples from Poland; stratospheric radionuclide inventories; and fallout of trace metals in New York City. Subsequent sections include tabulations of radionuclide levels in fallout, surface air, stratospheric air, milk, diet, tap water, and human bone. A bibliography of recent publications related to radionuclide studies is also presented. (See also W74-08955 and W74-08956) (Houser-ORNL)

RADIOACTIVITY DISTRIBUTION IN THE STRATOSPHERE FROM CHINESE AND FRENCH HIGH YIELD NUCLEAR TESTS (1967-1970),
National Oceanic and Atmospheric Administration, Silver Springs, Md. Air Resources Labs.
K. Telegadas.
In: Report No. HASL-281, p I-3 to I-112, April 1974. 49 fig, 14 tab, 48 ref.

Descriptors: *Nuclear explosions, *Radioactivity, *Distribution, *Meteorology, *Measurement, *Assay, Monitoring, Air pollution, Fallout, Water pollution, Degredation, Withdrawal, Summer, Autumn, Winter, Radioisotopes, Air pollution, Water pollution, Remote sensing.
Identifiers: France, China, Stratosphere, Concentration.

Radioactivity concentrations and ratios in stratospheric air samples up to 30 km described the latitudinal and vertical spread of debris from a stratospheric source. China detonated 3 MT devices at 40 deg N, 90 deg E on June 17, 1967; December 27, 1968; September 29, 1969, and October 14, 1970. Estimates of the initial source distribution for all four tests and the depletion of the resulting stratospheric burdens are discussed. Meteorological data pertinent to the four high yield tests, such as an estimate of the temperature profile at the time of detonation and the Northern Hemisphere constant level stratospheric maps up to 50 mb were used to explain, in part, the observed changes in the latitudinal distribution of radioactivity following each test. Common features of the radioactivity patterns for the four Chinese tests have been incorporated into composite pictures of the seasonal latitudinal distribution of radioactivity following summer, fall, and winter nuclear tests. (See also W74-08154) (Houser-ORNL)

ENVIRONMENTAL ASPECTS OF PLUTONIUM -- A SELECTED, ANNOTATED BIBLIOGRAPHY.
Oak Ridge National Lab., Tenn.
Available: NTIS, Springfield, Va., as Rept. No. ORNL-EIS-72-21; $13.60/copy; $1.45 microfiche. Report No. ORNL-EIS-72-21, September 1972. 391 p, 785 ref, 5 indexes.

Descriptors: *Bibliographies, Publications, *Plutonium, *Environment, Air pollution, Water pollution, Water pollution sources, Soil contamination, Ecology, Ecosystems, *Abstracts, Computer programs, Data storage and retrieval.

This bibliography is the first publication of the Environmental Plutonium Data Base, which is being assembled for computer storage and retrieval. The abstracts report observations and measurement methods about or applicable to plutonium in the environment. The subjects of central concern were the movement of plutonium through the environment, particularly that of the Nevada Test Site with emphasis on its availability to man. Related material, such as biological effects of plutonium, interaction of plutonium with various ecosystems, dispersion of fallout from nuclear explosions, was also included. Subject categories include the mode of input to the environment and its assessment. (See also W74-08958) (Houser-ORNL)
W74-08957

ENVIRONMENTAL ASPECTS OF PLUTONIUM AND OTHER ELEMENTS - A SELECTED ANNOTATED BIBLIOGRAPHY.
Oak Ridge National Lab., Tenn.
Available: NTIS, Springfield, Va., as Rept. No. ORNL-EIS-73-21 (Suppl. 1). $10.60/copy; $1.45 microfiche. Report No. ORNL-EIS-73-21 (Suppl. 1), August 1973. 491 p, 884 ref, 6 indexes.

Descriptors: *Bibliographies, Publications, *Abstracts, *Environment, *Plutonium, Americium, Uranium, Water pollution, Water pollution sources, Soil contamination, Ecology, Ecosystems, Path of pollutants, Human population, Public health, Computer programs, Data storage and retrieval.

A supplement to the bibliography (ORNL-EIS-72-21) published by the Environmental Plutonium Data Base Group contains an additional 884 references that have been prepared for computer storage and retrieval. The deposition and movement of plutonium, americium, and uranium and their pathway through terrestrial and aquatic ecosystems to man are emphasized. An effort is made to include numerical data in the abstracts and to refer to relevant tables (in the comment field). Indexes are given for authors, permuted titles, subject categories, keywords, publication description, geographic location, and taxonomy. (See also W74-08957) (Houser-ORNL)

THE INFLUENCE OF LIQUID WASTE DISPOSAL ON THE GEOCHEMISTRY OF WATER AT THE NATIONAL REACTOR TESTING STATION, IDAHO: 1952-1970,
Geological Survey, Idaho Falls, Idaho. Water Resources Div.
J. B. Robertson, R. Schoen, and J. T. Barraclough.
Available from NTIS, Springfield, Va, as IDO-22053, $7.60/copy, $1.45 microfiche. Report No IDO-22053, February 1974. 243 p, 74 fig, 16 tab, 104 ref.

Descriptors: *Nuclear powerplants, *Effluents, *Radioactive waste disposal, *Idaho, *Geochemistry, Hydrology, Meteorology, Surface water, Groundwater, Water pollution, Water pollution sources, Geology, Geohydrology, Groundwater recharge.
Identifiers: National Reactor Testing Station(Idaho Falls), *Snake River(Idaho).

A summarized evaluation is presented of the geology, hydrology, and water geochemistry of the National Reactor Testing Station (NRTS), Idaho and the associated influences of subsurface liquid-waste products discharged from the NRTS facilities. The progressive buildup, distribution, and changes of both radioactive and chemical wastes are analyzed for the total disposal period -- 1952-70. Of principal concern is the fate of wastes discharged from the NRTS in the Snake River Plain aquifer, an extremely large and productive groundwater system underlying the vast eastern Snake River Plain. Since 1952, the NRTS facilities (primarily the Test Reactor Area -- TRA, Idaho Chemical Processing Plant -- ICPP, and the Naval Reactor Facility -- NRF) have discharged 1.6 x 10(10) gallons of liquid waste containing 7 x 10(4) curies of radioactivity and about 1 x 10(8) pounds of chemicals to the subsurface. The discharge has been disposed in wells and seepage ponds. The principal waste products include tritiated water, strontium-90, cesium-137, cobalt-60, sodium chloride, chromates, and heat. Wastes at the NRTS have been distributed in the Snake River Plain aquifer and overlying bodies of perched groundwater according to hydrologic and geochemical controls. (Houser-ORNL)
W74-08962

THE DISTRIBUTION OF COBALT-60 RUTHENIUM-106 AND CESIUM-137 AMONG SUSPENDED AND DISSOLVED PARTICLES IN WHITE OAK LAKE,
Oak Ridge Gaseous Diffusion Plant, Tenn.
W. T. Lammers.
Available from NTIS, Springfield, Va, as Rept No K-1758; $4.00 per copy, $1.45 microfiche. Report No K-1758, October 1968. 20 p, 1 fig. 3 tab, 9 ref.

Descriptors: *Radioisotopes, *Radioactive wastes, Water pollution, Assay, Analytical techniques, Centrifugation, *Cobalt, *Ruthenium, *Cesium, Radiochemical analysis, Absorption, *Distribution, Isotope fractionation, Data collections, *Tennessee.
Identifiers: *White Oak Lake(Tenn).

White Oak Lake, a small impoundment that receives low level radioactive waste from the operation of the Oak Ridge National Laboratory, was sampled routinely during a 14-month period from November 8, 1966, to January 2, 1968. Each sample was centrifugally fractionated into selected particulate fractions and a dissolved materials fraction. These fractionations were extracted primarily to determine the feasibility of employing centrifugal techniques for isolating and concentrating waterborne particulate materials for study. In addition, the objective was to establish the relation between quantity, type, and surface- or bioactivity of the particles in a fraction and the accumulation of radionuclides by that fraction. The fractions isolated from samples of White Oak Lake water were subjected to radiochemical analysis. Linear correlations were calculated for several combinations of the data. From this statistical analysis and interpretation, the pattern of uptake and distribution of three radionuclides (Cobalt-60, Ruthenium-106, and Cesium-137) in the aquatic environment is better understood. ENVIRONMENTAL RADIOACTIVITY IN THE FAROES IN 1972,
Danish Atomic Energy Commission, Risoe. Research Establishment.
A. Aarkrog, and J. Lippert.
Available from NTIS, Springfield, Va., as RISO 292, $4.00 per copy, $1.45 microfiche. Report No 292, July 1973. 21 p, 8 fig, 18 tab, 6 ref.

Descriptors: Environment, *Radioactivity, *Monitoring, Measurement, *Fallout, *Strontium, *Cesium, Precipitation(Atmospheric), Grasses, Milk, Food, Fish, Vegetable crops, Oceans, Potable water, Aquatic plants, Human population, Diets.
Identifiers: *Faroes.

Measurements of fall-out radioactivity in the Faroes in 1972 are presented. Sr-90 (and Cs-137 in most instances) was determined in regularly collected samples of precipitation, grass, milk, lamb, fish, sea water, bread, and drinking water. In addition, analyses of spot samples of potatoes, sea plants, vegetables, eggs, and human bone were carried out. Estimates of the mean contents of Sr-90 and Cs-137 in the human diet in the Faroes in 1972 are given. (Houser-ORNL)
W74-09086

ENVIRONMENTAL RADIOACTIVITY IN DENMARK IN 1972,
Danish Atomic Energy Commission, Risoe. Research Establishment.
A. Aarkrog, and J. Lippert.
Available NTIS, Springfield, Va., as RISO 291, $7.00 per copy, $1.45 microfiche. Report No 291, June 1973. 99 p, 46 fig, 85 tab, 20 ref, 3 append.

Descriptors: Environment, *Radioactivity, *Fallout, Measurement, *Strontium, *Cesium, Precipitation(Atmospheric), Soils, Groundwater, Oceans, Grasses, Milk, Foods, Potable water, Air, Aquatic plants, Human population, Diets.
Identifiers: *Denmark.

The measurement of fall-out radioactivity in Denmark in 1972 is described. Strontium-90 was determined in samples from all over the country of precipitation, soil, groundwater, sea water, grass, dried milk, fresh milk, grain, bread, potatoes, vegetables, fruit, total diet, drinking water, and human bone. Furthermore Sr-90 was determined in local samples of air, rain water, grass, sea plants, fish, and meat. Caesium-137 was determined in soil, sea water, milk, grain products, potatoes, vegetables, fruit, total diet, and meat, and Cs-137 was measured by wholebody counting in persons from a control group at Riso. Estimates

of the mean contents of radiostrontium and radiocaesium in the human diet in Denmark in 1972 are given. The gamma-background was measured regularly at locations around Riso, at ten of the State experimental farms and in an area in Zealand, one in Jutland where future nuclear power plants might be located, and along the shores of the Great Belt. Regular surveys of environmental samples from the Riso area are included. (Houser-ORNL)
W74-09087

ENVIRONMENTAL RADIOACTIVITY IN GREENLAND IN 1972,
Danish Atomic Energy Commission, Risoe. Research Establishment.
A. Aarkrog, and J. Lippert.
Available from NTIS, Springfield, Va., as Riso 293, $4.00 per copy, $1.45 microfiche. Report No 293, July 1973. 17 p, 5 fig, 9 tab, 4 ref.

Descriptors: Environment, *Radioactivity, Measurement, *Assay, *Monitoring, *Fallout, *Cesium, *Strontium, Precipitation(Atmospheric), Oceans, Vegetation, Animal population, Potable water, Human population, Diets.
Identifiers: *Greenland.

Measurements of fallout radioactivity in Greenland in 1972 are reported. Strontium-90 (and Caesium-137 in most instances) was determined in samples of precipitation, sea water, vegetation, animals, and drinking water. Estimates of the mean contents of Sr-90 and Cs-137 in the human diet in Greenland in 1972 are given. (Houser-ORNL)

A BACTERIAL METHYLMERCURY-MINERALIZING ACTIVITY IN RIVER SEDIMENTS,
Brussels Univ. (Belgium). Laboratorium voor Ekologie en Systematiek.
G. Billen, C. Joiris, and R. Wollast.
Water Research, Vol 8, No 4, p 219-225, April 1974. 4 tab, 16 ref.

Descriptors: *Mercury, *Bottom sediments, Biodegradation, Biochemistry, Heavy metals, Path of pollutants, Bacteria, Ecology.
Identifiers: *Methyl mercury, *Belgium(Sambre River).

Bacterial activity involving mineralization of methylmercury was found in bottom sediments of the Sambre River (Belgium), in a zone highly polluted with inorganic mercury. The possibility that biological production of toxic methylmercury compounds occurs in such a medium gives a great ecological significance to this finding. The mineralizing capacity of the community can be increased in response to increased concentrations of methylmercury, probably by means of the selection of methylmercury-resistant bacterial species. Because of this adaptation, it is suggested that some equilibrium can be reached between the degradation of methylmercury and its addition to, or its production in, mineral mercury-polluted environments. (Knapp-USGS)

A SIMPLE SIMULATION METHOD FOR RIVER SELF-PURIFICATION STUDIES,
Centre Belge d'Etude et de Documentation des Eaux, Liege.
F. Edeline, and G. Lambert.
Water Research, Vol 8, No 5, p 297-306, May 1974. 10 fig, 28 ref.

Descriptors: *Self-purification, *Oxygen demand, *Oxygen sag, Nitrification, Mathematical models, Equations, Mixing, Reaeration, Dissolved oxygen, *Simulation analysis.

A simple simulation system is described for the study of river self-purification processes. A linear relationship between the organic load and the critical deficit on the sag curve was obtained for each temperature, corresponding to 36%-52% assimilation. The rate is not constant, and the monomolecular theory is not suitable to describe the results. Two distinct phases are observed. Nitrification appears as a second and distinct sag in the oxygen curve. It is limited by oxygen transfer and equilibrates at an 02 tension of 0.6-1.05 mg per liter. (Knapp-USGS)
W74-09093

DEPOSITION OF DDE AND POLYCHLORINATED BIPHENYLS IN DATED SEDIMENTS OF THE SANTA BARBARA BASIN,
California Univ., Bodega Bay. Bodega Marine Lab.
W. Hom, R. W. Risebrough, A. Soutar, and D. R. Young.
Science, Vol 184, No 4142, p 1197-1199, June 14, 1974. 1 fig, 1 tab, 15 ref. NSF Grant GX-32885, NFS Grant GA-27306.

Descriptors: *Polychlorinated biphenyls, *DDE, *Bottom sediments, *California, *Path of pollutants, Radioactive dating, Sedimentation.
Identifiers: *Santa Barbara Basin(Calif).

In the Santa Barbara Basin of the Southern California Bight, deposition of polychlorinated biphenyls (PCB) began about 1945 and DDE first appeared about 1952. Concentrations of both show a progressive increase through 1967; estimated deposition rates (in grams per square meter per year) in 1967 of DDE and PCB were 0.00019 and 0.00012, respectively. (Knapp-USGS)
W74-09097

ACID RAIN: A SERIOUS REGIONAL ENVIRONMENTAL PROBLEM,
Cornell Univ., Ithaca, N.Y. Section of Ecology and Systematics.
G. E. Likens, and F. H. Bormann.
Science, Vol 184, No 4142, p 1176-1179, June 14, 1974. 2 fig, 32 ref.

Descriptors: *Path of pollutants, *Precipitation(Atmospheric), *Acids, *Air pollution, Water pollution sources, Industrial wastes, Sulfates, Nitrates, Chlorides.
Identifiers: *Acid rain.

Acid rain and snow are falling on most of the northeastern United States. The annual acidity value averages about pH 4, but values between pH 2.1 and 5 have recorded for individual storms. The acidity of precipitation in this region apparently increased about 20 years ago, and the increase may have been associated with the augmented use of natural gas and with the installtion of particle-removal devices in tall smokestacks. (Knapp-USGS)
W74-09098

WATER QUALITY MODELS USING THE BOX-JENKINS METHOD,
Environmental Protection Service, Burlington (Ontario). Waste Water Technology Centre.
P. M. Huck, and G. J. Farquhar.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 100, No EE3, Paper 10629, p 733-752, June 1974. 9 fig, 7 tab, 13 ref, append.

Descriptors: *Time series analysis, *Path of pollutants, Water quality, *Statistical models, Water pollution, Chlorides, Dissolved oxygen, Model studies, Time series analysis.
Identifiers: *Box-Jenkins method.

The Box-Jenkins method, a time-based technique for time series analysis, is successful in modeling chloride and dissolved oxygen data for the St. Clair River near Corunna, Ontario. The technique is superior in the situation to either a frequency-based approach or a deterministic causative model. The model building process includes identification, estimation, and diagnostic checking stage. Forecasting and interpretation follow the derivation of successful models. An autoregressive type of model best represents the chloride data, and a moving average process represents the dissolved oxygen. Similar causative mechanisms appear to influence June and December chloride and June dissolved oxygen. (Knapp-USGS)
W74-09113

STOCHASTIC MODEL OF DYNAMIC EUTROPHIC ESTUARY,
Virginia Polytechnic Inst. and State Univ., Blacksburg.
W. R. Schofield, and R. G. Krutchkoff.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 100, No EE3, Paper 10578, p 613-628, June 1974. 1 fig, 2 tab, 23 ref, append.

Descriptors: *Estuaries, *Eutrophication, *Statistical models, *Path of pollutants, *Mathematical models, Stochastic processes, Water pollution, Potomac River, Model studies.
Identifiers: *Potomac estuary.

A stochastic model for a one-dimensional estuary was formulated. With the addition of a single new parameter, a stochastic model can be built from its deterministic counterpart. The derivation is sufficiently general to permit any number of components and any reasonable system configuration to be handled. All system parameters, conditions, and forcing functions could be continuous functions of time (not just tidal phase), position, and other factors. The Potomac estuary was modeled for the period January to October, 1969. Measured and predicted concentrations were compared in their means and in the distributions with good agreement. (Knapp-USGS)
W74-09114

THE TIDE OF INDUSTRIAL WASTE,
J. McCaull.
Environment, Vol 14, No 10, p 31-39, December 1972. 3 photo, 3 tab, 21 ref.

Descriptors: *Water pollution control, Contamination(Water), Pollution(Stream), Biochemical oxygen demand, Chemical wastes, *Industrial wastes, Wastes, *Water pollution sources, *Environmental effects, Waste treatment.

With the rise in industrial expansion, the country's streams and rivers are rapidly becoming more contaminated. Over a third of all pollution in United States streams is due to industry. Despite recycling and water purification programs, the net effect is still a further decline in water quality. Many segments of industry are turning to new materials or techniques to speed production at the cost of increased environmental degradation. The economy of the U.S. has been marked not only by a voracious absolute demand for more goods, but by a relative preference for goods whose production involves a substantial wasting of organic materials and water. In the immediate future there will be increased environmental pollution caused by organic chemical contamination. The major factor in this trend is the versatility of modern industrial chemistry, which is based on petroleum as a raw material. The costs of continued pollution must be weighed against the benefits of the technology causing it. Such an analysis must be applied to the decision process when considering the introduction of new technology, alternation of the old, and selection of alternatives if there is to

be a true balance between industrial and environmental demands. (Daniels-Florida)

W74-09206

NATURAL SOURCES OF SOME TRACE ELEMENTS IN THE ENVIRONMENT,
Geological Survey, Washington, D.C.
M. Fleischer.
In: Cycling and Control of Metals; Proceedings of Environmental Resources Conference, October 31-November 2, 1972, Columbus Ohio: Environmental Protection Agency National Environmental Research Center, p 3-10, February 1973. 1 fig, 9 tab, 42 ref.

Descriptors: *Lead, *Cadmium, *Arsenic compounds, *Mercury, Water pollution sources, Industrial wastes, Weathering, *Trace elements, *Path of pollutants.

Natural sources of lead, cadmium, arsenic, and mercury in the environment are discussed. Particular attention is directed towards concentrations of these elements in natural materials whose present uses (coal, phosphorite, sedimentary iron ores) or possible future uses (oil shale) could cause environmental problems. More than 90% of the lead and cadmium discharged into the atmosphere and streams can be ascribed to manmade sources. The natural sources of arsenic, particularly the erosion of surface rocks, may account for a significant portion of its discharge to the atmosphere and streams. The very large amount of material involved, especially the emanations from mud volcanoes, indicates the proportion of mercury reaching the atmosphere and waters from natural sources must be high; possibly of the order of 30% to 70% of the total. Sediments of southeastern Lake Ontario show a spectacular increase of mercury from 1906 to the 1940's. In this industrialized area, man's activities supply about two-thirds of the mercury. THE LEAD INDUSTRY AS A SOURCE OF TRACE METALS IN THE ENVIRONMENT,
Missouri Univ., Rolla.
B. G. Wixson, E. Bolter, N. L. Gale, J. C. Jennett, and K. Purushothaman.
In: Cycling and Control of Metals; Proceedings of Environmental Resources Conference, October 31-November 2, 1972, Columbus, Ohio: Environmental Protection Agency National Environmental Research Center, p 11-19, February 1973. 7 fig, 16 ref.

Descriptors: *Water pollution sources, *Mining, *Lead, *Missouri, *Mine water, Mine drainage, Mine wastes, Spoil banks, Air pollution, Streams, Trace elements, Heavy metals, Industrial wastes.
Identifiers: *New Lead Belt(Mo).

In order to evaluate the effects of the developing lead mines in southeastern Missouri on water quality and aquatic ecosystems, an extensive sampling program was established. Twenty-one principal sampling sites were selected. Samples were analyzed for both heavy metals and organic parameters of pollution. Heavy metal concentrations in the streams, before the start of the mining activity and in the control streams following the start of the activity, were in the range of 1 to 20 parts per billion (ppb) for copper, lead, and zinc. Most of the values were in the 4 to 6 ppb range and the water pH ranged from 7.0 to 8.8. The results of lead analyses on selected stream sites, over a 1-year period, showed 22 separate unfiltered samples which were in excess of the 0.05 ppm limit set for drinking water. High values were invariably concomitant with storm runoff. Problems with zinc in effluents occur in two mining and milling effluent discharges. The heavy metal content of mine and mill discharge waters, in the New Lead Belt of Southeastern Missouri, could be sufficiently reduced in retention lagoons to permit discharge into streams. Transport of ore concentrate in open trucks or railroad cars, without coverage, contributes windblown trace metals into the environment. The air pollution problems created by smelting the sulfide-containing concentrates include sulfure dioxide derived from sinter machines, as well as dusts, and fumes containing lead and other heavy metals from the sintering operation. SOURCES OF TRACE METALS FROM HIGHLY-URBANIZED SOUTHERN CALIFORNIA TO THE ADJACENT MARINE ECOSYSTEM,
Southern California Coastal Water Research Project, Los Angeles.
D. R. Young, C-S. Young, and G. E. Hlavka.
In: Cycling and Control of Metals; Proceedings of Environmental Resources Conference, October 31-November 2, 1972, Columbus, Ohio: Environmental Protection Agency National Environmental Research Center, p 21-39, February 1973. 7 fig, 15 tab, 9 ref.

Descriptors: *Path of pollutants, *Water pollution sources, *Trace elements, *California, *Sea water, Coasts, Advection, Ocean currents, Lead, Cadmium, Iron, Zinc, Mercury, Copper, Nickel, Manganese, Chromium, Urban runoff, *Municipal wastes.

Approximately 1000 mgd of treated municipal wastewaters are discharged daily through marine outfalls to the Southern California Bight. Most of this, 84%, receives primary treatment only. Trace metals monitoring programs by the major dischargers were established prior to, or during, 1971. This has enabled a reliable estimate of trace metal mass emission rates from municipal wastewater discharges to the Bight of 1971. Of the estimated input routes of locally derived copper and mercury, municipal wastewater discharge, vessel antifouling paint, and direct rainfall all appear to have about the same importance. For zinc, municipal wastewater and direct rainfall appear to predominate. In the case of lead, the surface runoff input is the same order as that of municipal wastewaters, but these sources probably contribute an order of magnitude less lead to the waters of the Bight than does aerial fallout. Cobalt, iron, and manganese are the only other trace metals studied that have surface runoff inputs of approximately the same importance as those of municipal wastewaters, and the inputs of these metals via both modes may be more dependent on natural than anthropogenic sources. However, for silver, cadmium, chromium, and nickel, present data suggest that municipal wastewater discharge to the Bight dominate all other locally-derived inputs. With the exception of chromium, lead, and iron, for each of the trace metals studied the sum of all estimated yearly inputs eminating from the coastal plain of the Bight is one to two orders of magnitude below the estimated annual flux of the metal through the Bight via ocean current advection. PHYSICAL TRANSPORT OF TRACE METALS IN THE LAKE WASHINGTON WATERSHED,
Washington Univ., Seattle.
R. S. Barnes, and W. R. Schell.
In: Cycling and Control of Metals; Proceedings of Environmental Resources Conference, October 31-November 2, 1972, Columbus, Ohio: Environmental Protection Agency National Environmental Research Center, p 45-53, February 1973. 6 fig, 5 tab, 28 ref. EPA Grant No R-800357.

Descriptors: *Trace elements, *Path of pollutants, *Washington, Lakes, Lead, Mercury, Copper, Zinc, Sodium, Iron, Air pollution, Industrial wastes, Municipal wastes.
Identifiers: *Lake Washington(Wash).

In the drainage basin of Lake Washington, trace metal enrichment is correlated with the cultural development of the region. The trace elements are brought into the local hydrosphere principally by advective atmospheric transport. Fluvial processes are of considerable significance, but appear to be reflected in the sediments primarily on the basis of the suspended load. Trace metal analysis of recent lake sediments can provide meaningful data concerning the impact of man on his environment, and offers a unique opportunity for evaluating past environmental conditions. Based on the lake volume, fluvial output and sedimentary deposition, the following mean residence times were estimated: iron, 11 days; lead, 26 days; mercury, 15 months; copper, 16 months; zinc, 21 months; and sodium, 29 months. The mean residence time for the lake water is also 29 months. (See also W74-09206) (Knapp-USGS)

EFFECT OF MINE DRAINAGE ON THE QUALITY OF STREAMS IN COLORADO, 1971-72,
Geological Survey, Lakewood, Colo.
D. A. Wentz.
Colorado Water Resources Circular No 21, 1974. 117 p, 9 fig, 3 plate, 12 tab, 93 ref, append.

Descriptors: *Acid mine water, *Mining, *Colorado, *Trace elements, Mine acids, *Iron, Heavy metals, Water temperature, *Sulfates, Copper, Zinc, Water pollution sources, Water pollution effects, Water quality, *Mine drainage.

Mine drainage in Colorado is commonly acid water containing high concentrations of iron and sulfate. The oxidation of metal sulfides under acid conditions releases high concentrations of trace elements to the water. Field observations of temperature, specific conductance, pH, stream-bottom conditions, and aquatic biota at 995 stream sites in Colorado during 1971-72 were used as a guide in collecting 192 samples for analysis of sulfate and dissolved trace elements. Approximately 450 miles of streams in 25 different areas are adversely affected by metal-mine drainage. Of the trace elements for which the U.S. Public Health Service has established drinking water standards, cadmium exceeds its limit in more than 12% of the samples, while arsenic and lead exceed their limits in 1-3% of the samples. Mercury and silver standards are not surpassed; chromium was not detected. Copper and zinc appear to present the greatest danger insofar as toxicity to resident aquatic life is concerned. Acid production is less of a problem in Colorado streams draining metal-mining areas than in streams draining the coal-mining areas of Appalachia. (Knapp-USGS)

Descriptors: *Environment, *Chemistry, *Plutonium, Soils, *Absorption, *Chemical reactions, Plants, *Aquatic soils, Sediments, Marine plants, Marine animals, Radioactive waste disposal, Movement, Leaching, Radioecology, Ecosystems, Iodine, Suspended solids.

Reports studies of the potential for plutonium complexation in soil and uptake by plants, characteristics of Hanford soils and aquatic sediments, fate and effect of oil on marine coastal ecosystems, radioecology of iodine-129, and suspended particle interaction. The possibility exists that the chemical form of plutonium may be directly altered by the soil microflora, thereby increasing plutonium solubility in soil and uptake by plants. The fate of radionuclides in a broad range of surface soils is being studied. Suspended matter and sediments of the lower Columbia River Watershed is of current concern. The fate and effects of oil on marine coastal ecosystems are reported. Emphasis is given to the behavior of transuranium elements in soil-plant systems. Studies of iodine-129 include theoretical dose calculations, field studies of I-129 in the environment, and laboratory studies of iodine movement in soils and plants. Consideration is given to the environmental mobility of plutonium with respect to plant canopies to determine transfer coefficients. (See also W74-09233) (Houser-ORNL)

5C. Effects Of Pollution

THE RECOVERY OF STREAM MACROBENTHIC COMMUNITIES FROM THE EFFECTS OF ACID MINE DRAINAGE,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
E. E. Herricks.
Available from the National Technical Information Service as PB-232 836; $18.50 in paper copy, $1.45 in microfiche. Ph D Dissertation June 1973. 279 p, 17 fig, 17 tab, 81 ref, 5 append. OWRR B-034-VA(4).

Descriptors: *Mine acids, *Mine drainage, *Water quality, Tributaries, Neutralization, *Pennsylvania, Water pollution control.
Identifiers: *Stream recovery, Macrobenthic communities, Recolonization, Indian Creek(Penn), Little Scrubgrass Creek(Penn).

The effects of short term low pH and long term acid mine drainage (AMD) stress were studied in relation to recovery and restoration of aquatic macrobenthic communities. Experimental acid additions were made to a healthy productive stream. Recovery was related to downstream drift of recolonizing organisms. A second study was made to observe drift born recolonizing organisms. Baetis sp. dominated drift collections and was most abundant in bottom fauna collections indicating a relationship between drift and section recovery. A two-year study was made on Indian Creek, Fayette Co., Pa. which received a major and several minor AMD discharges. Recovery was shown by density and diversity values similar to upstream reference stations. The addition of unpolluted tributary waters provided suitable habitat for recolonizing organisms and recovery occurred within 10 miles of the initial AMD discharges. Hydrologic and water quality models were also applied and developed. Estimated periods of high stream discharge correlated well with periods of high stream density and diversity in stream biota. Another study was made on Little Scrubgrass, Venango Co., Pa. to observe the effect of lime neutralization on the recovery process. Within 8 miles, water quality was restored downstream. Hydroxide floc, a by-product of AMD neutralization created a secondary stress at times.

PHOTOSYNTHESIS IN CELL DEVELOPMENT,
Maryland Univ., College Park. Dept. of Botany.
C. Sorokin.
Biochim. Biophy. Acta, Vol 94, No 1, p 42-52, 1965. (Illus).

Descriptors: *Algae, *Artificial media, *Testing, *Photosynthesis, *Cytological studies, Chlorophyta, *Chlorella, Metabolism, Water pollution effects.

Nonsynchronized suspensions of the green, high-temperature alga Chlorella 7-11-05 were subjected to fractional centrifugation, and two size groups of cells were separated. The small-cell fraction was presumed to consist largely of younger cells and the large-cell fraction predominantly of older cells. Manometric measurements in phosphate buffer at pH 4.5, in bicarbonate buffer at neutral pH, and in carbonate-bicarbonate buffer at pH 9.3 indicated that younger cells invariably possessed higher photosynthetic activity than older cells, provided the separation of cells into size fractions was reasonably good and the large cells were prevented from dividing during the process of separation. The superior activity of younger cells was ascertained at various light intensities and at different temperatures. Previous observations on the decline in photosynthetic activity with the age of synchronized cells were thus substantiated in the absence of a synchronizing agent, and the decline in photosynthetic capacity must be assumed to be characteristic of normal cell development. The decline in metabolic activity in the course of cell development is discussed in connection with metabolic turnover and is viewed as a demonstration of aging of cells.

ACCUMULATION OF DDT BY AQUATIC INDICATOR ORGANISMS,
Utah Univ., Ogden.
R. F. Gaufin.
Thesis, 1967. 230 p.

Descriptors: Degradation, *DDT, *Toxicity, *DDE, Water pollution effects, *Bioindicators, *Absorption, *Biomass.
Identifiers: Accumulation.

In laboratory and field studies on the accumulation of DDT by aquatic organisms, using both organisms with extensive previous exposure to DDT and those with no previous contact, the accumulation of DDT was related to the concentration of DDT in the water and increased with increases in concentration, in temperature, and in the solubility of the formulation used. The relative amounts of DDT accumulated tended to decrease with increase in biomass, and the rate of accumulation was affected by the composition of the biomass. The rates and mechanisms of accumulation for various species were related less to phylogenetic relations than to the degree of previous exposure of the population to DDT; samples from populations with a previous history of exposure could tolerate higher concentrations in the experiments and were more effective in accumulating, eliminating, and degrading DDT. Age and sex also had different effects on accumulation of DDT, which differed for different species. The method of uptake affected the residues found in the body; accumulation through the digestive system resulted in accumulation of large amounts of DDE, while accumulation through the exo-skeleton resulted in larger proportions of p,p'-DDT and o,p'-DDT. In view of the complex factors affecting the accumulation of DDT by aquatic organisms it is considered that no convenient scheme could be developed for the use of these organisms as indicators of pesticide contamination of surface waters.
W74-08716

RESPIRATION AND OSMOTIC BEHAVIOUR OF THE COPEPOD ACARTIA TONSA IN DILUTED SEA WATER,
Hull Univ. Dept. of Zoology. (England).
J. Lance.
Comparative Biochemical Physiology, Vol 14, No 3, p 155-165, 1965. (Illus.).

Descriptors: Physiology, *Salt tolerance, *Copepods, *Respiration, Plankton, *Osmotic pressure, Oxygen requirements, Water pollution effects.
Identifiers: *Acartia tonsa.

Adult females of the euryhaline planktonic copepod Acartia tonsa show increased oxygen requirements when the salinity of the surrounding sea water is lowered. The rise in respiration occurring during an 8-hr period of exposure to the diluted medium ranges from 0.077 ul oxygen/mg dry weight/hr at 90% sea water (0.7% increase) to 6.061 ul oxygen/mg/hr at the lowest salinity 30% sea water (101.4% increase). The increased metabolic rate can persist in diluted sea water for more than 24 hr. The internal osmotic concentration of copepods transferred from full-strength sea water to 50% sea water falls rapidly due to entry of water into the body. After 1 hr no further osmotic change can be detected.
W74-08717

THE EFFECT OF TEMPERATURE ON THE GROWTH AND SURVIVAL OF SEVEN MARINE ALGAL SPECIES,
Fish and Wildlife Service, Milford, Conn.
R. Ukeles.
Biological Bulletin, Vol 120, No 2, p 255-264, 1961.

Descriptors: *Algae, Temperature, *Cultures, Thermal pollution, *Marine algae, Phytoplankton, Water pollution effects, Growth, Inhibition, Chlorella.
Identifiers: *Algal growth.

The effect of temperatures ranging from 8 deg to 29 deg C on the growth of 17 species of marine phytoplankton has been investigated. Growth of all organisms tested took place between 18 deg and 22 deg C. There was no growth of the following organisms above 30 deg C: Monochrysis lutheri, Isochrysis galbana, Phaeodactylum tricornutum, Chlamydomonas sp., Chlorella sp. (UHMC), Protococcus sp. (T3), Nitzschia laevis, and Melosira sp. Multiplication at 30 deg C occurred in Dunaliella euchlora, Chlorella sp. (580), Chlorococcum sp., Platymona sp., Protococcus sp. (T9), Amphiprora sp., Actinocyclus sp. and Amphora sp. Survival at elevated temperatures is often dependent upon the time of exposure. The absence of growth at an elevated temperature may be due either to an inhibition that is reversible or to an irreversible heat death. At 8 deg C the rate of growth may be reduced or inhibited, but in no case was this low temperature lethal.
W74-08718

PHOSPHORUS CONTENT AND RATE OF GROWTH IN THE DIATOMS CYCLOTELLA NANA AND THALASSIOSIRA FLUVIATILIS,
New York State Dept. of Health, Albany. Div. of Labs., and Research.
G. W. Fuhs.
Journal of Phycology, Vol 5, No 4, p 312-321, 1969. (Illus).

Descriptors: *Algae, *Growth rates, *Chemostat, *Phosphorus, *Diatoms, Water pollution effects.
Identifiers: Turbidostat, *Cyclotella nana, *Thalassiosira fluviatilis.

Cyclotella nana and T. fluviatilis were grown in chemostat and turbidostat units in 1/3 strength artificial seawater supplemented with nutrients and vitamin B12 in excess except for P which in concentrations of 50 or 100 ug/liter was limiting. Different chemostat and turbidostat settings produced different cell numbers per unit volume which, since external P was practically nil, corresponded to varying amounts of bound P per cell. Growth rate plotted vs. P per cell follows a saturation curve. While no growth occurs at a certain minimum content of bound P, half the maximum growth rate is observed at twice the minimum level of P, 3/4 of the maximum at 3 times the minimum level, etc., the maximum growth rate being defined as that observed during growth unrestricted by P supply at a given set of conditions (light, temperature, salinity, etc.). Temperature and light were varied from 13.5 to 24 deg C and from 2000 to 6000 lux (continuous and intermittent). An abnormal growth curve was found with C. nana at 24 deg C and 6000 lux continuous light. Any change in P content of the cells significantly alters cell composition as reflected in P distribution in acid-soluble, lipid, and acid-insoluble fractions and in organic C content. External P does not immediately enter the equation for growth rate but is one of the factors determining rate of P uptake and therefore bound P per cell. Conditions governing uptake, however, cannot be adequately controlled in a chemostat and therefore should be determined in a different experimental approach. (See also W72-02718)
W74-08719

INFESTATION OF THE COPEPOD ACARTIA TONSA WITH THE STALKED CILIATE ZOOTHAMNIUM,
Lehigh Univ., Bethlehem, Pa. Dept. of Biology.
S. S. Herman.
Science, Vol 146 (3643), p 543-544, 1964. (Illus).

Descriptors: Ecology, *Symbiosis, *Protozoa, *Copepods, *Maryland, Water pollution effects, Animal parasites.
Identifiers: *Acartia tonsa, *Patuxent River(Md), Zoothamnium, Acartia clausi.

An entire population of the copepod Acartia tonsa in the Patuxent River, Maryland, was infested with a stalked protozoan of the genus Zoothamnium. Each copepod had 25 to 200 ciliates attached around the appendages. The infestation occurred at the time when Acartia tonsa was being replaced as the dominant copepod by Acartia clausi.

ON THE REARING OF COPEPODS IN THE LABORATORY, (SUR L'ELEVAGE DE COPEPODES AU LABORATOIRE),
Centre National de la Recherche Scientifique, Gif-sur-Yvette (France).
L. de Lepiney.
Hydrobiologia Vol 20, No 3, p 217-222, 1962.

Descriptors: *Copepods, Chlorella, Cultures, Water pollution effects.
Identifiers: *Rearing techniques, *Cyclops vicinus, Colpidium compylus, Paramecium caudatum.

The effects of rearing Cyclops vicinus in 5 different culture media are described. Using the best medium a further 7 spp. of copepod were reared and fed with Chlorella pyrenoidosa, Colpidium campylus or Paramecium caudatum.
W74-08721

SOME CHEMICAL CONSIDERATIONS IN THE DESIGN OF SYNTHETIC CULTURE MEDIA FOR MARINE ALGAE,
Marine Biological Station, Millport (Scotland).
M. R. Droop.
Bot Marine, Vol 2, Nos 3/4, p 231-246, 1961 (Illus).

Descriptors: *Algae, *Cultures, Chelaton, Iron, Hydrogen ion concentration, Salinity, *Metals, *Oxidation-reduction potential, Water pollution effects.
Identifiers: *Chelating agents, *EDTA, Citric acid.

The mode of action of chelating agents is discussed with reference first to iron, Eh and pH, then to the influence of salinity and chelating agent on the general equilibrium in mixtures of metals. Citric acid has distinct advantages over EDTA in marine media. Control of redox potential and of pH is discussed.
W74-08722

AN ALGAL MASS CULTURE UNIT FOR FEEDING MARINE INVERTEBRATE LARVAE,
Commonwealth Scientific and Industrial Research Organization, Crenulla (Australia). Div. of Fisheries and Oceanography.
B. Wisely, and C. Purday.
Australia Commonwealth Scientific and Industrial Research Organization, Division Fish. and Oceanogr. Technical Paper 12. 2-12, 1961 (Illus).

Descriptors: *Algae, *Cultures, *Aseptic conditions, *Temperature, *Growth rates, Water pollution effects, Chrysophyta, Invertebrates.
Identifiers: Isochrysis galbana, Dunaliella tertiolecta, Phaeodactylum tricornutum, Bacillariphta, Flagellates.

A unit is described which produces unialgal but not bacteria-free continuous or batch (400 l.) cultures. In three experiments at 19-20C the flagellate Isochrysis galbana Parke (Chrysophyceae) reached maximum densities of 2.0, 0.8, and 2.2 x 10 to the 6th power cells/ml in 37, 39, and 30 days of culture respectively. In three experiments at 19-20C the flagellate Dunaliella tertiolecta Butcher (Chlorophyceae) gave densities of 1.7, 1.9, and 2.2 x 10 to the 5th power cells/min in 13, 63, and 27 days. In five experiments at various temperatures the diatom Phaeodactylum tricornutum Bohlin (Bacillariophyceae) gave densities of 1.5, 2.3, 3.2, 3.2, and 6.0 x 10 to the 6th power cells/ml in 21 (27C), 11 (27C), 22 (23C), 22 (22C), and 26 (17C) days. In all experiments densities suitable for feeding larvae were obtained within 10 days.
W74-08723

SOME METHODICAL OBSERVATIONS ON THE USE OF ANTIBIOTICS FOR PREPARING BACTERIA-FREE ALGAL CULTURES,
Magyar Tudomanyos Akademia, Tihany. Biological Research Inst.
L. J. M. Felfoldy, and Z. F. Kalko.

Acta Biol Acad Sci Hungaricae, Vol 10, No 1, p 95-99, 1959.

Descriptors: *Algae, *Cultures, *Antibiotics, *Centrifugation, Water pollution effects, Bacteria.
Identifiers: *Aseptic condition, Organic agar media.

Bacteria-contaminated unialgal liquid cultures were passed through sterile medium by centrifugation and the centrifuged cells were allowed to stand in a sterile nutrient solution containing penicillin, streptomycin, aureomycin, and xanthracidine for 24 hours. Then the antibiotics were removed by repeated centrifugation and a large number of dilution cultures were made from each algal sample in Petri dishes containing peptone-yeast-glucose agar media. With this procedure, the ratio between algae and bacteria growing on the surface of the organic agar media was favorable.
W74-08724

SURVIVAL OF SOME PELAGIC COPEPODS OF THE BLACK AND MEDITERRANEAN SEAS IN WATER OF DIFFERENT SALINITY, (VYZHIVANIE NEKOTORYKH PELAGICHESKIKH KOPEPOD CHERNOGO I VREDIZEMNOGO MOREI V VODE RAZLICHNOI SOLENOSTI),
Institute of Biology of the Southern Seas, Sevastopo (USSR).
A. V. Kovalev.
Gidrobiol ZH, Vol 2, No 1, p 43-48, 1966 (Illus).

Descriptors: *Salt tolerance, *Copepods, Salinity, Water pollution effects.
Identifiers: *Acartia clausi, *Survival rates, Black Sea, Mediterranean sea.

The results are presented of experiments on the survival of certain species of pelagic Copepoda in water of varying salinity. The species surviving over a wide range of salinity were chiefly those that are common for both the Black and Mediterranean seas. Of the Black Sea Copepoda the greatest changes in salinity were tolerated by the 'small' Acartia clausi which inhabits bay, sounds and the coast of the Black Sea where there are sharp fluctuations in the salinity of the water. The Black Sea Copepoda -- with the exception of the 'large' A. clausi tolerated an increase in salinity better than a decrease. They have, apparently, retained some part of their previous saline spectrum.
W74-08725

EFFECTS OF COPEPOD GRAZING ON TWO NATURAL PHYTOPLANKTON POPULATIONS,
British Columbia Univ., Vancouver. Dept. of Zoology.
B. T. Hargrave, and G. H. Geen.
Journal of Fishery Research Board of Canada, Vol 27, No 8, p 1395-1403, 1970 (Illus).

Descriptors: *Grazing, *Algae, *Primary productivity, *Copepods, *Canada, Phytoplankton, Water pollution effects.
Identifiers: *Acartia, Nova Scotia(Cape Breton Island).

Feeding and filtration rates of 4 species of copepods (Pseudocalanus minutus, Temora longicornis, Oithona similis, and Acartia tonsa) from Bras d'Or Lake and Morrison's Pond, Cape Breton Island, Nova Scotia, were measured in the laboratory with natural populations of phytoplankton. Adult copepods ingested all sizes of flagellates (1-15 u in maximum dimension) but 5-15-u cells were removed most efficiently. Ceratium sp. and Chaetoceros sp., principal spring and winter forms, were not utilized. Feeding rate declined as the number of animals per liter and the duration of the experiment increased. Estimates of feeding rates in nature were derived by extrapolation from the results of laboratory experiments. A comparison of estimates of mean summer primary production at the depths of maximum photosynthesis and daily zooplankton food intake suggested that, at those depths, zooplankton in Bras d'Or Lake consumed all the average daily production whereas 66% was removed in Morrison's Pond. The remaining production in Morrison's Pond probably contributed to the support of large rotifer and ciliate populations not found in Bras d'Or Lake. Natural concentrations of flagellates were more than sufficient to meet copepod respiratory energy requirements under laboratory conditions.

MARINE PHYTOPLANKTON VARY IN THEIR RESPONSE TO CHLORINATED HYDROCARBONS,
Woods Hole Oceanographic Institution, Mass.
D. W. Menzel, J. Anderson, and A. Randtke.
Science, Vol 167, p 1724-1726, March 1970. 1 fig, 9 refs. (Contribution No 2424 from Woods Hole Oceanographic Institute). NSF Grant GB 15103, AEC Contract AT(30-1)-3862.

Descriptors: *DDT, *Chlorinated hydrocarbon pesticides, *Phytoplankton, Diatoms, Water pollution effects, Photosynthesis, Growth rates, Dieldrin, Endrin, Toxicity.
Identifiers: Skeletonoma costatum, Dunaliella tertiolecta, Coccolithus huxley, Cyclotella nana.

Photosynthesis and growth in cultures of four marine phytoplankton species (Skeletonema costatum), (Dunaliella tertiolecta), (Coccolithus huxley), and (Cyclotella nana) isolated from different oceanic environments, were affected by three chlorinated hydrocarbons (DDT, dieldrin, and endrin) to varying extents. This ranged from complete insensitivity in Dunaliella to toxicity at concentrations of 0.1 to 1.0 part per billion of the pesticides in Cyclotella. Other forms were intermediate in their response.

RESPONSES OF GYMNODINIUM BREVE DAVIS TO NATURAL WATERS OF DIVERSE ORIGIN,
Florida State Univ., Tallahassee. Dept. of Biological Science.
A. Collier, W. B. Wilson, and M. Borkowski.
Journal of Phycology, Vol 5, No 2, p 168-172, 1969.

Descriptors: *Algae, *Productivity, Water types, *Growth rates, Sulfides, Iron, Nitrogen, Phosphorus, Water pollution effects.
Identifiers: *Gymnodinium breve, EDTA.

The effect on the growth of Gymnodinium breve of river waters and seawater samples collected in different seasons and locations was investigated with and without differential enrichments. Growth in natural seawater was most clearly enhanced by addition of EDTA-Fe, sulfide, N and P. The seasonal variation in growth-promoting properties of seawater and river water dominates variations due to differences in location.
W74-08731

LIGHT QUALITY AND CONCENTRATION OF PROTEINS, RNA, DNA AND PHOTOSYNTHETIC PIGMENTS IN TWO SPECIES OF MARINE PLANKTON ALGAE,
Simon Fraser Univ., Burnaby (British Columbia). Dept. of Biological Sciences.
D. G. Wallen, and G. H. Geen.
Marine Biology, Vol 10, p 44-51, 1971.

Descriptors: *Marine algae, *Light quality, Physiology, *Chlorophyll, *Protein, Photosynthesis, Phytoplankton, Pigments.
Identifiers: *DNA, *RNA, *Cyclotella nana, *Dunaliella tertiolecta.

Chlorophyll, protein, DNA and RNA concentrations in cultures of Cyclotella nana (Hustedt) and Dunaliella tertiolecta (Butcher) were higher in blue light and lower in green light than in white light of the same intensity. Total carotenoid concentrations were highest in green light. Total pigment concentrations were highest in cells grown in blue light, lowest in those from green light. The relative changes in pigment concentrations associated with differences in spectral composition of the radiation are comparable to those often observed in phytoplankton from various depths in stratified natural water. Light adaptation in algae as a response to light quality is suggested. The chemical composition of plankton algae can be expected to vary considerably with depth.
W74-08736

LIGHT QUALITY IN RELATION TO GROWTH, PHOTOSYNTHETIC RATES AND CARBON METABOLISM IN TWO SPECIES OF MARINE PLANKTON ALGAE,
Simon Fraser Univ., Burnaby (British Columbia). Dept. of Biological Sciences.
D. G. Wallen, and G. H. Geen.
Marine Biology Vol 10, p 34-43, 1971.

Descriptors: *Marine, Algae, *Light quality, *Productivity, *Growth rates, Photosynthesis, Metabolism.
Identifiers: *Cyclotella nana, *Dunaliella tertiolecta.

The effect of light quality on growth, photosynthesis and carbon metabolism in two species of marine algae, Cyclotella nana (Hustedt) and Dunaliella tertiolecta (Butcher), was examined. Relative growth constants for C. nana were 0.37, 0.29 and 0.25 in blue, white and green light, respectively. Corresponding constants were 0.41, 0.31, and 0.29 for D. tertiolecta. Photosynthetic rates in both species were higher in blue light and lower in green light compared with white light of the same intensity. More than 60% of 14C assimilated by C. nana or D. tertiolecta grown in blue or green light was incorporated into the ethanol-insoluble fraction

compared with 10 to 30% in this fraction in white light. The relative importance of the various components within this fraction was independent of light quality. Although less 14C was assimilated into the ethanol-soluble fraction in blue or green light, there was a relative increase in some amino acids and organic acids in this fraction and a decrease in sugars and sugar phosphates relative to white light of the same intensity. These differences were independent of light intensity, photosynthetic rate and cell density in the cultures.

THE SALINITY TOLERANCE OF SOME ESTUARINE PLANKTONIC COPEPODS,
Hull Univ. (England). Dept. of Zoology.
J. Lance.
Limnology and Oceanography, Vol 8, p 440-449, 1963.

Descriptors: Salinity, *Copepods, *Temperature, *Salt tolerance, Estuarine environment, Water pollution effects.
Identifiers: *Acartia spp.

The salinity tolerance of three species of Acartia was investigated in the laboratory by recording the survival of female copepods at various salinities. The salinity tolerance of A. tonsa, A. discaudata, and A. bifilosa captured during the autumn, winter, and spring, respectively, depended on the temperature. Thermal prehistory of copepods affected their survival in diluted seawater, all species being most tolerant when the experiment and environmental temperature were close and least tolerant when the experimental and field temperatures differed markedly. The following order of salinity tolerance was established: A. tonsa, A. bifilosa, A. discaudata. Reinvestigation of the temperatures at which copepods had shown poorest survival in diluted seawater demonstrated that temperature acclimation increased salinity tolerance. The results imply that cooling of the environment might not necessarily lower the tolerance of the autumn, warmwater species, A. tonsa, provided that the change was gradual and that slow warming might not cause a decline in the tolerance of the spring, cold-water species, A. bifilosa. Salinity acclimation increased the salinity tolerance of A. bifilosa. The recovery of A. bifilosa in full-strength seawater after short exposure to low salinities depended on the length of exposure.

A CONTINUOUS RECIRCULATING CULTURE SYSTEM FOR PLANKTONIC COPEPODS,
National Marine Water Quality Lab., West Kingston, R.I.
E. J. Zillioux.
Marine Biology, Vol 4, No 3, p 215-218, November 1969.

Descriptors: *Plankton, *Copepods, Cultures, *Protozoa, Decomposing organic matter, Water pollution effects.
Identifiers: *Acartia spp., Euplotes vannus, Isochrysis galbana, Rhodomonas baltica, Flagellates.

The calanoid copepods, Acartia clausi Giesbrecht and Acartia tonsa Dana, are maintained at high densities in continuous culture at 15C. Synthetic sea-water medium is recirculated through filters and a foam tower which limits accumulation of dissolved wastes and various metabolites. The ciliate Euplotes vannus Muller is associated in culture with the copepods, and effectively controls bacterial population and accumulation of algal debris. The copepods graze upon the ciliates as well as upon the phytoflagellates Isochrysis galbana Parke and Rhodomonas baltica Korsten.

GROWTH RATES OF MARINE PHYTOPLANKTON: CORRELATION WITH LIGHT ABSORPTION BY CELL CHLOROPHYLL A.,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
R. W. Eppley, and P. R. Sloan.
Physiology Plant, Vol 19, No 1, p 47-59, 1966 (Illus).

Descriptors: *Growth rates, *Photosynthesis, Pigments, Cytological studies, *Chlorophyll, Phytoplankton, *Marine algae.
Identifiers: *Dunaliella tertiolecta.

Cellular contents of phytosynthetic pigments, cell volumes, cell surface areas and specific growth rate have been determined for batch cultures of 10 spp. of marine phytoplankton grown at a single constant light intensity and temperature. Similar data were obtained for Dunaliella tertiolecta at several light intensities and temperatures. The data were used to derive a model for predicting growth rate from a knowledge of temperature and light absorption by cell chlorophyll a. Growth rate was compared also with cell volume and surface area.

INFLUENCE OF SOME ENVIRONMENTAL FACTORS ON PRODUCTIVITY OF PLANKTONIC ALGAE IN CULTURE. (ETUDE DE L'INFLUENCE DE QUELQUES FACTEURS DE MILIEU SUR LA PRODUCTIVITE D'UNE ALGUE PLANCTONIQUE EN CULTURE).
Aix-Marseille Univ., Marseille (France). Faculte des Sciences.
S. Maestrini.
Rec. Trav. Sta. Mar. Endoume, Vol 57, No 41, p 33-108, 1966 (Illus.).

Descriptors: *Algae, *Cultures, *Growth rate, *Productivity, *Photosynthesis, Pigments, Carbon dioxide, Plant physiology, Water pollution effects.
Identifiers: Algal growth, Sulfactamide, Chloroamphenicol.

An elevation of light intensity from 1,000 to 7,200 lux is accompanied by more active growth and decreased pigment content in the Phaedactylum tricornutum cells. It is possible to eliminate the associated bacterial microflora with sulfacetamide and chloramphenicol, but this decreases algal growth. An atmosphere of air favors an increased rate of carbon assimilation, and an increase in the quantity of pigments produced. There is a decline in population density with increasing age of culture. This may be partly explained by the decrease in carbon dioxide concentration in the medium, but there may also be a change in the physiological state of the cells.

EXTRACELLULAR CARBOHYDRATE LIBERATION IN THE FLAGELLATES ISOCHRYSIS GALBANA AND PRYMNESIUM PARVUM,
Imperial Coll. of Science and Technology, London (England).
A. F. H. Marker.
Journal of Marine Biology Association, United Kingdom, Vol 45, No 3, p 755-772, 1965.

Descriptors: *Algae, Physiology, *Growth rates, Testing, *Carbohydrates, Cultures, Salinity, Nitrogen, *Productivity, Cytological studies.
Identifiers: Flagellates, *Isochrysis galbana, *Prymnesium parvum, Axenic cultures.

Extracellular carbohydrate liberation in I. galbana Parke and P. parvum N. Carter was studied in axenic culture in artifical sea water. Increased extracellular carbohydrate liberation occurred at both reduced and increased salinity and under conditions of N starvation in Isochrysis. Maximum production occurred during the early and later stages in growth falling to a minimum during the midgrowth phase. Greater extracellular carbohydrate production was found in Prymnesium. The cells did not appear to be damaged during harvesting. Hydrolysis of both extra- and intracellular carbohydrate yielded glucose, galactose, arabinose, xylose, and ribose. It is suggested that the presence of this extracellular carbohydrate is due to the passive release of organic matter from dead or dying cells.

THE PRODUCTION OF EXTRACELLULAR CARBOHYDRATES BY SOME MARINE FLAGELLATES,
Yale Univ., New Haven, Conn. Osborn Zoological Lab.
R. R. L. Guillard, and P. J. Wangersky.
Limnology and Oceanography, Vol 3, No 4, p 449-454, October, 1958.

Descriptors: *Algae, *Carbohydrates, *Productivity, Cytological studies, *Cultures.
Identifiers: *Flagellates(Marine), Isochrysis galbana, Monochrysis lutheri, Prymnesium parvum.

Extracellular carbohydrate production during the growth of bacteria-free cultures of the marine flagellates Isochrysis galbana, Monochrysis lutheri, Prymnesium parvum, Dunaliella euchlora, Pyraminomonas sp., Rhodomonas sp., and Chlamydomonas sp. was followed by the N-ethyl carbazole method. Carbohydrate production did not parallel cell numbers during exponential growth of any of these organisms: maximum concentrations during this phase were under 3 mg/L. Carbohydrates accumulated in all stationary cultures (having 1 million - 10 million cells/ml), to the greatest extent in Prymnesium cultures, which attained 123 mg/L. Isochrysis and Monochrysis produced 25 and 16 mg/L, respectively, while the others had under 10 mg/L even when cell disintegration was evident.

LIGHT AND TEMPERATURE RELATIONS IN A SMALL DESERT POND AS INFLUENCED BY PHYTOPLANKTONIC DENSITY VARIATIONS,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
S. B. Idso, and J. M. Foster.
Water Resources Research, Vol 10, No 1, p 129-132, Feburary 1974, 5 fig, 8 ref.

Descriptors: *Phytoplankton, *Ponds, *Light, *Solar radiation, *Density, Temperature, Algae, Regime, Waste water(Pollution), Seepage, Water sampling, Chlorophyll, Water pollution effects.
Identifiers: Hygrothermograph, Thermocouples, Eppley pyronometer, Kipp solarimeter, Kemmerer-type water sampler bottle.

A significant relationship was observed in a small desert man-made pond between phytoplankton concentrations and concurrent light and temperature regimes. Measurements of solar radiation, air, and water, temperature were recorded at 4 different depths every half hour over a 3-month period. Chlorophyll a and b values were measured every few days to determine density variations in the phytoplanktonic community. The depth of penetration of solar radiation was mainly controlled throughout the summer months by the concentration of phytoplankton. The degree of light penetration in turn controlled the severity of temperature stratifications within the pond. During periods of algal blooms, a sequential cooling of lower layers and a warming of the surface layers occurred. This rise in surface temperatures during algal blooms was calculated to be sufficient to increase the daytime water-air vapor pressure difference about 25 percent, indicating that evaporation may be influenced by planktonic density variations. PHOSPHORUS AND CARBON IN LAKE POLLUTION,
Basf-Wyandotte Chemical Corp., Mich.
L. E. Kuentzel.
Environmental Letters, Vol 2, No 2, p 101-120, 1971. 41 ref.

Descriptors: *Algae, *Phosphorus, *Carbon, Carbon dioxide, *Lakes, Alkalinity, Algae control, Growth rates, Organic matter, Organic wastes, *Water pollution sources, Water pollution effects.

Recent laboratory and field tests and literature on the relationship between algae, phosphorus, and carbon in lake pollution are summarized. Algae can develop in waters containing only 10 ppb or less of phosphorus. Most natural waters have 10 ppb or more. Phosphorus is widespread in nature and widely used by man. Indications are that it will not be possible to reduce phosphorus to less than 10 ppm in urbanized areas by eliminating it from only detergents. It takes two pounds of carbon dioxide to grow one pound of algae. The amounts of carbon dioxide available from the atmosphere and the natural alkalinity of lake water are severely limited by physical and chemical laws. Algae growth depending solely on alkalinity and the atmosphere for carbon is relatively slow and limited by a rising pH at about 10. When adequate organic pollution is present, bacteria can undergo a massive population explosion, produce large amounts of carbon dioxide, and cause massive algae growths. The role of the organic matter becomes more evident in those cases where algae growth is massive in the presence of such pollution even though the phosphorus content of the water never exceeds 10 ppb. It appears that algae growth will be controlled only when organic pollution is controlled, regardless of the phosphorus content. (Merritt-FIRL)

OXYGEN UTILIZATION IN BACTERIAL-PROTOZOAN COMMUNITY,
Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
R. P. Canale, and F. Y. Cheng.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 100, No EE1, p 171-185, February 1974. 10 fig, 1 tab, 14 ref.

Descriptors: *Biochemical oxygen demand, Investigations, Recycling, Organic matter, Water quality, *Protozoa, Nutrients, Cycling nutrients, Bacteria, *Mathematical studies, *Model studies, Metabolism, Water pollution effects.
Identifiers: *Aerobacter aerogenes, *Tetrahymena pyriforms.

The dynamic relation between oxygen utilization, nutrient consumption, and bacterium and protozoan growth in bath cultures was investigated with A. aerogenes and T. pyriforms. The results were interpreted with a mathematical model which incorporated the interactions of the bacterium and the protozoan as well as the effects of nutrient availability and oxygen utilization. The model has several unique aspects: nutrient recycling and refractory carbohydrate accumulation, protozoan bioenergetics, and protozoan cell size variability. The experimental and modeling results confirm the findings of Bhatla and Gaudy that the plateau observed in BOD tests is a slow bacterial respiration phase. It was shown that the second stage oxygen demand in heterotrophic bacterial protozoan communities is the result of protozoan metabolism. These findings should be useful for defining organic matter stabilization pathways in multicomponent ecological models and for water quality management. (Merritt-FIRL)

ASPECTS OF WATER POLLUTION IN FERTILISER INDUSTRY,
Central Public Health Engineering Research Inst., Nagpur (India).
G. J. Mohanrao, and P. V. R. Subrahmanyam.
Indian Journal of Environmental Health, Vol 15, No 4, p 271-282, October, 1973. 1 fig, 5 tab, 13 ref.

Descriptors: *Fertilizers, *Water pollution sources, Industries, Toxicity, Industrial water, Waste water(Pollution), Water pollution control, Ammonia, Fluorides, Phosphates, Nitrogen compounds, Arsenic compounds.
Identifiers: *India.

There has been a continuous growth in the fertilizer industry in India in recent years to meet the ever increasing demand. The processes of manufacturing different types of nitrogenous and phosphatic fertilizers are described briefly. The volume and characteristics of the waste water discharged from the industry are indicated. The waste waters contain a variety of pollutants which include ammonia, fluorides, arsenic, phosphate, and urea. Water pollution potential of different units in the fertilizer industry is discussed. The need for better process control for reduction of water pollution is stressed. (Sandoski-FIRL)

Descriptors: *Eutrophication, Nutrients, Primary productivity, *Phosphorus, Trophic level, Agriculture, Industry, Recreation, Water quality, Economics, Lakes, Taxes, Detergents, Waste water treatment, Water pollution control, *Lake Michigan, *Lake Erie, *Management.
Identifiers: Cost effectiveness, Regional management, *Mass flow model, Excise taxes.

The environmental problems of phosphorus pollution are examined using an activity analysis approach to account for phosphorus inputs to surface waters. For purposes of analysis, this study assumes phosphorus to be the limiting factor in algal growth and eutrophication. A mass flow model, general enough to be applied to specific lakes or river basins, was developed in order to relate the flow of phosphorus from all activities in a basin to the consequences of eutrophication. Various control tactics to limit mass flow and thus eutrophication were defined from the standpoint of both supply and demand for phosphorus producing products and the management of phosphorus uses. Combinations of feasible controls designated as strategies, were applied to the model to determine the cost-effectiveness of the strategies in minimizing eutrophication. A hypereutrophic hypothetical lake basin, Lake Michigan, and Lake Erie were analyzed as case examples to test the model and control methods. Overall strategies were derived for the hypothetical lake and then applied to Erie and Michigan. In simple terms, phosphorus management strategies seemed feasible for control of eutrophication in present-day Lake Michigan while waste treatment together with management strategies was necessary for Lake Erie. THE DEVELOPMENT OF PHOSPHATE FREE HEAVY DUTY DETERGENTS,
Gillette Co. Research Inst., Rockville, Md.
A. M. Schwartz, and S. E. Davis.
Copy Available from GPO Sup Doc as EP1.23:600/2-74-003, $2.65; microfiche from NTIS as PB-232 943, $1.45. Environmental Protection Agency, Technology Series, Report EPA-600/2-74-003, March 1974. 234 p, 49 fig, 29 tab, 102 ref. EPA Project 16080 FWE, Contract 14-12-875.

Descriptors: Economic Analysis, *Detergents, *Surfactants, Toxicity, Domestic wastes, Water Quality, Reviews, *Soaps, *Biodegradation, *Water Pollution effects.
Identifiers: *Phosphate-free detergents.

The purpose was to demonstrate state-of-the-art possibilities for producing phosphate-free household laundry detergents of satisfactory environmental and performance characteristics. The work involved formulation of several hundred experimental detergent compositions using different surfactant-builder combinations. These were tested for laundering performance, acceptability of physical form, biodegradability, aquatic toxicity, potential hazard in use, and growth stimulation of algae. Feasibility of economical production on an industrial scale was also considered. Some partially satisfactory formulations were found, and their shortcomings assessed with regard to performance and/or economic feasibility. These formulations coincide remarkably with formulations developed independently by industry. Further work with promising new builders and surfactant builder combinations is recommended, but only along environmental and health hazard lines. (EPA)

EARLY LIFE HISTORY AND FEEDING OF YOUNG MOUNTAIN WHITEFISH,
Utah State Univ., Logan. Dept. of Wildlife Science.
C. B. Stalnaker, and R. E. Gresswell.
Copy Available from GPO Sup Doc as EP1.23:660/3-73-019, $0.95; microfiche from NTIS as PB-232 992, $1.45. Environmental Protection Agency, Ecological Research Series Report EPA-660/3-73-019, January 1974. 46 p, 18 fig, 13 tab, 1 ref. EPA Project 18050 DPL.

Descriptors: *Life history studies, *Spawning, *Water temperature, Fish behavior, *Fish food organisms, Fry, Aquatic habitats, Fish eggs, Thermal pollution, Morality, Hatching, *Utah, Water pollution effects.
Identifiers: *Mountain whitefish, *Culture methods, Fish growth, *Logan River(Utah).

Early life history studies and development of culture methods of the mountain whitefish

(Prosopium williamsoni) were conducted in the Logan River, and in the Utah State Research Laboratory and USU Fisheries Laboratory. Spawning was observed in the laboratory and in the Logan River from mid-November to mid-December during dusk. At ambient river temperature from 1.7-6.1 C eggs began hatching after 79 days and continued for 23 days. Total mortality to hatch of eggs from weekly collections from five areas was 92%. In the laboratory, at 7.2 C eggs began hatching in 52 days and continued for 23 days; at 8.9 C in 45 days and continued for 30 days. Larval whitefish from two areas showed differences in growth due to temperature experience. Growth was examined in the laboratory at 6, 9, and 12 C. A simple linear model for predicting growth was developed. Whitefish began feeding when 14-15 cm long, and fed near the bottom mainly on Chironomid larvae. Larval whitefish were raised at 2-14 C at 2 degree intervals, and were fed dry trout feed, Oregon Moist Pellets, mosquito larvae, and brine shrimp. Starved fish died earlier at higher temperatures; mortality ranged from 15% for 3 months on brine shrimp to 98% in 1.5 months on Oregon Moist Pellets. (Siefert-EPA)

POLLUTION EFFECTS ON ADULT STEELHEAD MIGRATION IN THE SNAKE RIVER,
Idaho Univ., Moscow. Coll. of Forestry.
C. M. Falter, and R. R. Ringe.
Copy Available from GPO Sup Doc as EP1.23:660/3-73-017, $1.50; microfiche from NTIS as PB-232 990 $1.45. Environmental Protection Agency, Ecological Research Series Report EPA-660/3-73-017, February 1974. 101 p, 23 fig, 3 tab, 6 ref. EPA Project 18050 DMB.

Descriptors: *Rainbow trout, *Kraft mill effluent, Oxygen, Water pollution effects, *Migration behavior, Water temperature, Water velocity, Ultrasonic transmitters, Pre-impoundment water quality Anadromous fish, *Idaho, *Utah.
Identifiers: *Snake River(Idaho-Wash.), Lewiston(Idaho).

A three-year field study was conducted in 1969-1971 to assess the relationship of Kraft mill effluent and pre-impoundment water quality to adult steelhead trout (Salmo gairdneri Richardson) behavior in the Snake River, Idaho-Washington. Steelhead were tagged with ultrasonic tags and followed through a 25 km section of the proposed Lower Granite Reservoir. Limnological parameters were measured and compared with fish behavior. Mixing patterns of the Clearwater River with the Snake River were also assessed. Mean water quality changes in the Snake River as a result of pollution inputs in the study are very subtle. In terms of toxic affects from chemical loading, Snake River water quality is not greatly altered except in the immediate area of pollution input; steelhead avoidance of these localized problem areas, was not observed. No significant correlation could be made between any chemical water quality parameter and steel head behavior. However, as temperature dropped below 15 C fish movement slowed, fish generally stopped moving at night, and resting periods increased in length and number. Steelhead showed a preference to move in water with off-bottom current velocities of 0.2 to 0.5 m/sec and showed a definite pattern of crossover and resting points. (EPA)
W74-08833

EFFECTS OF TEMPERATURE ON DISEASES OF SALMONID FISHES,
Oregon State Univ., Corvallis. Dept. of Microbiology.
J. L. Fryer, and K. S. Pilcher.
Copy Available from GPO Sup Doc as EP1.23:660/3-73-020, $1.55; microfiche from NTIS as PB-232 988 $1.45. Environmental Protection Agency, Ecological Research Series Report EPA-660/3-73-020, January 1974. 114 p, 8 fig, 20 tab, 6 ref. EPA Project 18050 DIJ.

Descriptors: Animal diseases, Effluents, *Fish diseases, Heated water, Infection, Microorganisms, Pathogenic bacteria, Pathology, *Thermal pollution, Water pollution, Water quality, Water temperature, Water pollution effects, *Salmon, *Trout, *Salmonids.

The effect of water temperature on infections of salmonid fish was investigated. Chondrococcus columnaris infection was studied in rainbow trout, coho and spring chinook salmon; Aeromonas salmonicida infection in coho and spring chinook salmon; and Aeromonas liquefaciens infection in steelhead trout. In all cases mortality rates were high at 64 F; moderate at 54 F; and low or zero at 39 to 49 F. Progress of the infections was accelerated at higher temperatures, and progressively retarded at decreasing temperature levels. In infection of coho with Ceratomyxa shasta, mortality was high at 69 F, low at 49 to 54, and zero at 39 to 44 F. This infection in rainbow trout resulted in high mortality at all temperatures except 39 degrees. In both cases the course of the disease was most rapid at higher temperatures, and became progressively slower as the temperature decreased. For infection of kokanee salmon fingerlings with sockeye salmon virus, the temperature range of 54 to 59 F was optimal. In this range mortality rates were high, and the course of the disease was most rapid. At higher temperatures mortality rates were lower, and at 39 to 44 F, progress of the disease was retarded, though total mortality was often high. (EPA)

THE ROLE OF ORGANIC DEBRIS AND ASSOCIATED MICRO-ORGANISMS IN PELAGIC ESTUARINE FOOD CHAINS,
Maryland Univ., Solomons. Natural Resources Inst.
D. R. Heinle, D. A. Flemer, J. F. Ustach, R. A. Murtagh, and R. P. Harris.
Available from the National Technical Information Service as PB-232 949 $4.75 in paper copy, $1.45 in microfiche. Maryland Water Resources Research Center, College Park, Technical Report No 22, (1973). 123 p, 12 fig, 11 tab, 45 ref. OWRR B-016-MD (1), 14-31-0001-3893.

Descriptors: *Marshes, *Detritus, *Copepods, Estuaries, *Food chains, *Maryland, *Productivity, Decomposing organic matter, Microorganisms, Primary productivity.
Identifiers: *Patuxent estuary(Md), *Marsh production, Eurytemora affinis, Scottolana canadensis.

Production on marshes adjacent to the upper Patuxent estuary was 1,000 to 1,500 grams dry weight per m2 per year. Approximately 6 to 9 percent of the annual production was exported to the estuary as particulate carbon. Production was comparable to other marsh systems but export (as percentage of production) was less, probably due to poor tidal exchange. In spite of the relatively low percentage of their fixed carbon contributed to the estuary, the marshes provide about one-third of the total carbon budget in the upper Patuxent. A large portion of the marsh carbon enters the estuarine system in early spring when levels of algal primary production are low. Substantial production of the calanoid copepod, Eurytemora affnis occurs with detrital carbon as the apparent food base. Feeding experiments indicate that E. affinis can reporduce when fed a diet of detritus enriched with bacteria and protozoa, or when fed only protozoa. Diets of detritus and micro-organisms alone were seldom equal to algal controls however, suggesting that detritus provides only part of the carbon requirement. A harpactacoid copepod, Scottolana canadensis, was found less capable of using detritus and associated microorganisms, but could obtain some energy from that source.

EFFECT OF INDUSTRIAL WASTES OF MEMPHIS AND SHELBY COUNTY ON PRIMARY PLANKTONIC PRODUCERS,
Christian Bros. Coll., Memphis, Tenn.
Robert Staub, John Appling, and Adrian M. Hofstetter.
Completion Report, October 1969, 31 p, 4 fig, 3 tab, 9 ref. OWRR Project B-004-TENN (1).

Descriptors: Correlation analysis, Iron, *Industrial wastes, Plankton, Turbidity, Chlorides, *Tennessee, Mississippi River, *Diatoms, *Primary productivity.
Identifiers: Diversity index, *Navicula, Nonconnah Creek(Tenn), Synedra, Wolf River(Tenn), *Memphis(Tenn).

Plankton analyses were used to study industrial waste pollution during 1968-69 at eleven stations on the Mississippi River and two Memphis tributaries: Wolf River drainage (north) and Nonconnah Creek (south). Correlation studies indicated that water temperature and chloride content correlated positively with total plankton (and diatom) counts; turbidity and iron content correlated negatively with these counts. Positive correlation was found between some counts and total hardness, pH, and silica content. The same general pattern appeared for centric and pennate diatoms and for the genera Navicula and Synedra. Possibility of an indicator for industrial waste pollution is confirmed by these results as well as by those of the second approach utilized: diversity index. Four classes of pollution in terms of ranges of diversity indices appeared: (1) heavy, with indices from 0.00 to 1.00; (2) moderate, from 1.00 to 2.00; (3) light, 2.00 to 3.00; and (4) slight to none, 3.00 to 4.50. Bar graphs giving magnitude of diversity indices for all samples helped in comparing degrees of pollution; e.g., one station with a heavy load of industrial waste effluent showed a significant difference in diversity index value from the same tributary upstream where little to no industrial wastes were present. VERTICAL DISTRIBUTION OF MICROBIAL PLANKTON IN SOUTHERN PART OF LAKE BAIKAL IN 1969, (IN RUSSIAN),
Biologo-Geograficheskii Nauchno-Issledovatelskii Institut, Irkutsk (USSR).
E. A. Maksimova, and V. N. Maksimov.
Mikrobiologiya. Vol 41, No 5, p 896-902, 1972. Illus. English summary.
Identifiers: Biomass, Lakes, Microbial studies, *Phyto-plankton, *USSR(Lake Baikal), *Vertical distribution.

Microbial plankton distribution in waters of the southern part of Lake Baikal (USSR) was studied for 1 yr. Two maxima of the microbial growth were confirmed: in the spring under ice (April) and in the summer (August-Sept.). The maxima are due to the growth phases of phytoplankton and to the water thermal properties. The biomass of microbial plankton was determined for the layer of 0-500 m. Microbial forms changed in the course of the year. The number of microbial cells during summer stagnation was higher than data obtained earlier by other authors; this can be interpreted as a result of human activity on the banks of Baikal and its tributaries.--Copyright 1973, Biological Abstracts, Inc.

A FOSSIL PLANT ENVIRONMENTAL IMPACT STUDY,
Nebraska Public Power District, Columbus.
E. Sloth, and M. Locke.
Power Engineering, Vol 78, No 4, p 52-55, April, 1974. 5 fig.

Descriptors: *Fossil fuels, Sampling, Reservoirs, Measurement, Analysis, *Nebraska, Water districts.
Identifiers: *Environmental impact statements, *Power districts, *Sutherland reservoir(Neb).

The environmental impact study made by the Nebraska Public Power District for the proposed fossil fuel plant at Sutherland Reservoir is discussed. The studies are of much the same nature and scope as for a nuclear plant with a few exceptions: radioactivity measurement is deleted, and programs for baseline SO2 and particulate matter measurements and monitoring are instituted. A program of metering, sampling, counting, analyzing and logging has been underway about a year. It will be about 5 years before the plant goes into operation. During that time, the gathered data and deductions from it will indicate the relative vulnerability of various targets to various plant influences. The data will indicate sampling frequencies that should be increased or decreased, and it will disclose the presence of cyclical and irregular fluctuations in biota counts. (Merritt-FIRL)

SIGNIFICANCE OF ECOLOGICAL ANALYSES IN THE INTERPRETATION OF ENVIRONMENTAL RELEASES OF RADIONUCLIDES,
Oak Ridge National Lab., Tenn.
S. I. Auerbach, H. A. Vanderploeg, S. V. Kaye, and J. P. Witherspoon.
IEEE Transactions on Nuclear Science, Vol NS-21, No 1, p 18-22, February, 1974. 4 fig, 1 tab, 8 ref.

Descriptors: *Ecology, Analysis, *Radioisotopes, Aquatic environment, Cesium, Fishes, Potassium, Organic matter.
Identifiers: Oligotrophic waters, Eutrophic waters, Bioaccumulation factors.

The role of ecological analyses in the collection and interpretation of environmental measurements that are part of the surveillance programs of aquatic cosystems around nuclear facilities is discussed. Bioaccumulation factors are used to predict the radionuclide concentrations an organism accumulates from charonic releases. The bioaccumulation factor is the ratio of radionuclide concentration in the organism to that in water. Bioaccumulation factors range from less than 1 to greater than 100,000 depending on the element, organism, and the environmental and ecological factors. The bioaccumulation factors of cesium in fishes are illustrated as a function of potassium concentration in the water, feeding habits and eutrophy. The highest bioaccumulation factors are found in piscivorous fishes from oligotrophic waters, which are waters of low nutrient and organic content. Piscivorous fishes are expected to have the highest bioaccumulation factors because Cs concentration increases with trophic level. The generally lower bioaccumulation factors in eutrophic water may result from sorption of Cs to the more abundant particulate organic matter in these waters. Particulate organic matter strongly absorbs many radionuclides. (Merritt-FIRL)

CHLORINE RESIDUALS IN TREATED EFFLUENTS,
Illinois Univ., Urbana. Dept. of Civil Engineering.
V. L. Snoeyink, and F. I. Markus.
Water and Sewage Works, Vol 121, No 4, p 35-38, April, 1974. 3 tab, 16 ref.

Descriptors: *Chlorine, *Toxicity, *Effluents, *Streams, Inlet, *Illinois, Chlorination, Reviews, Ammonia, Water pollution, Water pollution sources, Water pollution control, Activated carbon, Sulfur compounds, Investigations, *Waste water treatment.
Identifiers: Dechlorination, Sulfur dioxide.

Toxicity studies on chlorine residuals in treated effluents are reviewed and the results of a field survey are presented wherein the concentration and type of chlorine residual present in treated effluents were determined. Chlorine residuals in the concentration range of 1-5 mg/liter as C12 are being discharged to receiving waters in central Illinois as a result of chlorination of effluents for disinfection. The residual is predominantly monochloramine and in most instances it is being discharged to streams which provide little dilution. Other research has shown that chlorine residual imparts a definite toxicity to the discharge; stream criteria of 0.002 to 0.2 mg/liter total chlorine residual have been recommended depending on the type of fish to be protected in the receiving water and on whether the residual is continuously or intermittently present. Dechlorination can be achieved by use of sulfur compounds or by activated carbon. The carbon will also remove any ammonia. (Merritt-FIRL)
W74-08891

IMPACT OF BEACH NOURISHMENT ON DISTRIBUTION OF EMERITA TALPOIDA, THE COMMON MOLE CRAB,
Virginia Univ., Charlottesville.
B. Hayden, and R. Dolan.
Journal of the Waterways Harbors and Coastal Engineering Division, American Society of Civil Engineers Vol 100, No WW2, p 123-132, May, 1974. 7 fig, 1 tab, 10 ref.

Descriptors: *Crabs, *Ecological distribution, *Hydrogen sulfide, Beaches, Legal aspects, Sands, Currents, Wildlife management, *North Carolina.
Identifiers: *National Environmental Policy Act(1969), *Ecological impact, *Cape Hatteras(N.C.), Beach-nourishment, Emerita talpoida, Mole-crabs, Engineering projects.

Since the 1969 National Environmental Policy Act was passed, the determination of ecological impacts of engineering projects on such wildlife as the crab has become a practical and legal necessity. Emerita talpoida was studied at a Cape Hatteras, North Carolina beach-nourishment site. On the discharge of nourishment materials it was found: the sands are transported across and down the beach via swash and longshore currents; E. talpoida move down the beach, and result in increased densities at one location; at termination of discharge, recovery takes between three days and a week or two. Mole-crab population here experienced a migration rather than massive mortality. High hydrogen sulfide levels are postulated as cause for a temporary drop in population level. Redistribution of the population is the significant effect. (Prague-FIRL)

SALINITY-OZONE INTERACTIVE EFFECTS ON YIELD AND WATER RELATIONS OF PINTO BEAN,
Agricultural Research Service, Riverside, Calif. Salinity Lab.
G. J. Hoffman, E. V. Maas, and S. L. Rawlins.
Journal of Environmental Quality, Vol 2, No 1, p 148-158, January-March, 1973. 4 fig, 2 tab, 16 ref.

Descriptors: *Salinity, *Air pollution effects, Air pollution, Plant growth, *Beans, Leaves, *Ozone, Oxidation, Osmotic pressure, Water pollution effects.
Identifiers: Pinto beans.

The interaction of salinity and ozone on the growth of pinto bean was evaluated in a controlled temperature light room. Salinity treatments having osmotic potentials of -0.4, -2.0, and -4.0 bars were studied in combination with 2-hour daily exposures to 0, 0.15, 0.25, and 0.35 ppm of ozone. Ozone at 0.15 ppm decreased the yield of nonsaline plants nearly 50%; and at 0.25 ppm and higher, no significant yield was obtained. The results were essentially the same for plants salinized to -2.0 bars. At -4.0 bars, the yield at 0.25 ppm was only reduced to half that of the ozone-free treatment. The results indicate no interaction between salinity and ozone below 0.15 ppm. Above 0.15 ppm, however, there is a large interaction. At salinities of -0.4 and -2.0 bars, water-use efficiency decreased as ozone increased. Ozone did not appear to influence leaf water potential or its components. (Skogerboe-Colorado State)
W74-08922

A STUDY OF THE EUTROPHICATION OF THE SURFACE WATERS OF PYRAMID LAKE,
Nevada Univ., Reno. Dept. of Chemical and Metallurgical Engineering.
J. L. Hendrix, and M. F. Deguire.
Available from the National Technical Information Service as PB-232 998: $3.00 in paper copy, $1.45 in microfiche. Completion Report, November 1973. 18 p, 1 fig, 4 tab, 17 ref. OWRR A-047-NEV(1). 14-31-0001-3828.

Descriptors: *Eutrophication, Surface waters, Brackish water, Water pollution effects, *Nevada, Algae, Phosphates, *Cyanophyta, *Light intensity, Growth rates, Anabaena, Water quality.
Identifiers: *Pyramid Lake(Nev), *Algal growth, *Nodularia spumigena, Chemostats.

The capacity of the Pyramid Lake, Nevada, environment to grow algae was studied. Pyramid Lake is a brackish terminal located in the Intermontane region. To understand the uniqueness of the lake's environment, both field and laboratory investigations were necessary. From field studies, the water quality, the pH of the lake, and the temperatures of the lake were obtained during the algal bloom in the summers of 1972 and 1973. By using phosphate concentration as the criteria, the lake could be classified as eutrophic. The main contributor to the bloom was the blue-green algae, Nodularia spumigena. Nodularia spumigena was isolated and cultured in the laboratory. Using the purified stock as inoculant, work using chemostats was conducted. In the fermentors, it has been determined that N. spumigena is sensitive to the light intensity. Light intensities of 100 foot candles for twelve hours per day cause the cell to bleach and then die. Actually, growth in the chemostats occurred only when the intensity was reduced to 35 foot candles. At that intensity the cells remained green and healthy looking. It was also determined that Nodularia spumigena can grow under diverse water qualities and strains of Anabaena can grow in the Pyramid Lake environment.

THE NUCLEAR FUEL CYCLE -- A SURVEY OF THE PUBLIC HEALTH, ENVIRONMENTAL AND NATIONAL SECURITY EFFECTS OF NUCLEAR POWER,
Union of Concerned Scientists, Cambridge, Mass.
D. F. Ford, T. C. Hollocher, H. W. Kendall, J. J. MacKenzie, and L. Scheinman.
Available: Union of Concerned Scientists, P.O. Box 289, MIT Branch Station, Cambridge, Mass. 02139. $6/copy. October 1973. 212 p, 5 fig, 21 tab, 129 ref, 3 append.

Descriptors: *Nuclear powerplants, Fuels, Cycles, *Radioactive waste disposal, Effluents, Regulation, Safety, *Uranium, Transportation, Mining, Waste storage, Hazards, Biology, *Public health, Population, Food chains, Tritium, Krypton radioisotopes, *Reviews, Environmental effects.
Identifiers: *Plutonium.

The report comprises reviews of the milling of uranium and the subsequent disposal of radioactive tailings, the storage and disposal of high level radioactive wastes, the exposure of uranium miners to radioactive gas, problems of diversion during routine transport of nuclear material for terrorist purposes, and some of the operating history of the first United States fuel reprocessing plant. In addition, a brief survey of the earlier and extensive UCS analyses of catastrophic nuclear power plant accidents is included. (See W74-08948 thru W74-08953) (Houser-ORNL)

STORAGE AND DISPOSAL OF HIGH LEVEL WASTES,
Brandeis Univ., Waltham, Mass. Dept. of Biochemistry.
T. C. Hollocher.
In: The Nuclear Fuel Cycle -- A Survey of the Public Health, Environmental and National Security Effects of Nuclear Power. p 8-55, October 1973. 3 fig, 3 tab, 28 ref, 2 append.

Descriptors: *Nuclear powerplants, *Effluents, Radioactive waste disposal, *Air pollution, Water pollution, *Soil contamination, Environmental effect, Fuels, Hazards, Safety, Evaluation, Assessment, Waste storage, Corrosion, Leakage, Research and development.
Identifiers: Fuel reprocessing.

Proposals for long-term storage or disposal of high-level waste from the nuclear power industry largely lie at the research and development stage. The proposals so far considered seriously by the AEC for the disposal of wastes are dubious in concept, not technically feasible, or they are so dependent upon site specific geological characteristics that suitability cannot be determined a priori without extensive on-site investigation. The impression is inescapable, in view of the present imprecise state of affairs, that no convincing statements exist regarding the long-term environmental impact attending the storage and/or disposal of wastes from fuel reprocessing. It is disturbing in this regard that the pace of development of a suitable waste disposal technology does not seem commensurate with the rate of expansion of the nuclear power industry. (See also W74-08947) (Houser-ORNL)

THE NUCLEAR SAFEGUARDS PROBLEM,
Cornell Univ., Ithaca, N.Y. Peace Studies Program.
J. Scheinman.
In: The Nuclear Fuel Cycle -- A Survey of the Public Health, Environmental and National Security Effects of Nuclear Power, p 56-74, October 1973.

Descriptors: *Nuclear energy, *Radioactivity, Safety factors, *Public health, *Transportation, Cites, Reasonable use, Economics, Cost-benefit theory, Regulation, Air pollution, Water pollution, Soil contamination, Disasters, Uranium, Plutonium.
Identifiers: Safeguards, Non-proliferation treaty, National security, Sabotage.

Nuclear power presents an added dimension to the issue of public health and security that arises from the fact that the same nuclear material that is capable of providing light for a city's thoroughfares, buildings, and residences is, when fabricated correctly and employed as a weapon, also capable of obliterating that city and its inhabitants. The task of insuring that such use, or the threat of such use, shall never occur is referred to as the nuclear safeguards problem. It is a subject of international scope. One major problem of the U.S. today is diversion from peaceful uses or theft. Nuclear safeguards in transportation ranks equally high. (See also W74-08947) (Houser-ORNL)
W74-08949

CATASTROPHIC NUCLEAR ACCIDENTS,
Union of Concerned Scientists, Cambridge, Mass.
D. F. Ford, and H. W. Kendall.
In: The Nuclear Fuel Cycle -- A Survey of the Public Health, Environmental and National Security Effects of Nuclear Power, p 75-91, October 1973. 16 ref.

Descriptors: *Accidents, *Hazards, *Safety, *Assessment, Regulation, Evaluation, Fuels, Nuclear powerplants, Public health, Safety factors, Toxicity, Administrative agencies, Federal government, Legal aspects.
Identifiers: *Nuclear fuel cycle, *Catastrophic accident.

The emergency core cooling system (ECCS) is a matter of national controversy. The matters discussed at the ECCS hearing were highly technical and of great volume. It is not possible to summarize the technical arguments and positions in a satisfactory manner. However, a brief, largely non-technical summary is presented of these important matters drawing on the ECCS hearing record, several UCS analyses, and other sources. (See also W74-08947) (Houser-ORNL)
W74-08950

RADIATION HAZARDS FROM THE MISUSE OF URANIUM MILL TAILINGS,
Brandeis Univ., Waltham, Mass. Dept. of Biochemistry.
T. C. Hollocher, and J. J. MacKenzie.
In: The Nuclear Fuel Cycle -- A Survey of the Public Health, Environmental and National Security Effects, p 92-115, October 1973. 2 tab, 14 ref, append.

Descriptors: *Uranium, *Radium, Environmental effects, Air pollution, Water pollution, Toxicity, Public health, *Mining, Mills, Mine wastes, Construction material, *Radioactivity, Regulation, X-rays, Gases, Administrative agencies, *Radioisotopes.
Identifiers: Population exposure.

The extraction of uranium from ore results in a sand-like material, called tailings, which still contains most of the original radium, and in some fluids and slimes which also contain radium. Prior to 1959 the disposal and handling of these materials caused the pollution of streams and water supplies by radium in the Southwestern United States. Prior to 1966 uranium tailings were used as fill and for other construction purposes around buildings. Some 3300 buildings have been discovered to be associated with tailings in and around Grand Junction (Mesa County) Colorado, some 5,000 buildings in the whole of Colorado, and perhaps 7,000-8,000 buildings altogether in the United States. The tailings emit alpha-rays and radon gas which expose persons indoors. In view of the situation described above and in anticipation of the milling of uranium ore which is soon to begin for the nuclear power industry, recommendations are made to alleviate the exposure. (See also W74-08947) (Houser-ORNL)
W74-08951

LUNG CANCER AMONG URANIUM MINE WORKERS,
Brandeis Univ., Waltham, Mass. Environmental Studies Program.
A. S. Schurgin, and T. C. Hollocher.
In: The Nuclear Fuel Cycle -- A Survey of the Public Health, Environmental and National Security Effects of Nuclear Power, p 116-148, October 1973. 1 fig, 4 tab, 41 ref.

Descriptors: *Mining, *Uranium, Human population, Human pathology, Epidemiology, Public health, Air pollution, Water pollution, Toxicity, Morbidity, Mortality, *Air pollution effects, Environmental effects.
Identifiers: Occupational exposure, Inhalation, *Lung cancer.

Large scale mining of uranium for atomic weapons began in Southwestern U.S. in 1946 following the passage of the Atomic Energy Act, and continued through about 1968 when the existence of adequate stockpiles of uranium led to a reduction in mining activities. During this period, and especially from 1946-1960, some 6,000 underground miners were significantly and needlessly exposed to radioactive gases present in the air of uranium mines. After analysis of the foregoing, recommendations are made to help protect the health and lives of present underground uranium miners. (See also W74-08947) (Houser-ORNL)
W74-08952

NUCLEAR FUEL REPROCESSING: RADIOLOGICAL IMPACT OF WEST VALLEY PLANT.
In: The Nuclear Fuel Cycle -- A Survey of the Public Health, Environmental and National Security Effects of Nuclear Power, p 149-207, October 1973. 1 fig, 10 tab, 27 ref.

Descriptors: *Fuels, *Nuclear powerplants, *Effluents, *New York, *Environmental effects, *Radioactivity, Waste treatment, Sites, Population, Density, Uranium, Plutonium, Liquid wastes, Monitoring, Water pollution, Streams, Fish, Standards, Sediments, Tritium, Public health, Iodine, Krypton, Strontium, Cesium.
Identifiers: Fuel reprocessing plant, *West Valley(N.Y.), Deer.

The operations of the Nuclear Fuel Services (NFS) reprocessing plant, located in West Valley, New York, are described and its radiological impacts on its surroundings for its first five years of operation are reviewed. The radioactive releases to the air and water from the plant during the period 1966-1971 were significant enough for the AEC and the State of New York to have required major modifications. As a result of the installation of a low level waste treatment facility, some of the liquid radioactive emissions, since 1971, have been reduced. Nevertheless, the future plant capacity at NFS will eventually increase by a factor of 15 over 1971 throughput. Also, most of the fuel reprocessed at NFS to date has been cooled for much longer than the 150 days minimum required by the NFS license, suggesting that future emissions may be greater as cooling periods are shortened. Recommendations based on the analysis of the plant's past and present operations are given. (See also W74-08947) (Houser-ORNL)

FINAL ENVIRONMENTAL STATEMENT RELATED TO THE PROPOSED HOPE CREEK GENERATING STATION UNITS 1 AND 2.
Directorate of Licensing (AEC), Washington, D.C.
Aval: NTIS, Springfield, Va., as Rept. No. Docket 50354-100; $10.60/copy, $1.45/microfiche. Report No. Docket 50354-100 and 50355-100, February 1974. 359 p, 30 fig, 47 tab, 141 ref, 3 append.

Descriptors: *Nuclear powerplants, Effluents, Environment, Administrative agencies, Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *New Jersey.
Identifiers: *Boiling water reactors, Artificial Island, *Delaware River, *Environmental impact statements.

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the proposed issuance of a construction permit for the Hope Creek Generating Station Units 1 and 2. The station is located in the state of New Jersey, on Artificial Island and will consist of two boiling-water reactors. Waste heat will dissipate into the atmosphere by a natural-draft cooling tower and blowdown water from the towers will be diluted with water withdrawn from and discharged to the Delaware River. Environmental impacts are assessed and after consideration of alternatives, an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion was to issue a construction permit for the facility subject to the following limitations: (1) additional study of proposed chlorination methods; (2) complete a preoperational ecological monitoring program; (3) obtain a water allocation waiving Tocks Island reservoir, and ensure compensating water storage capacity; (4) do certain redesign if necessary to protect aquatic ecosystems; (5) monitor for salt deposition; and (6) continuous efforts to guard against irreversible damage in plant construction and operation. (Houser-ORNL)
W74-08959

FINAL ENVIRONMENTAL STATEMENT RELATED TO CONSTRUCTION OF ST. LUCIE PLANT, UNIT 2.
Directorate of Licensing (AEC), Washington, D.C.
Available from NTIS, Springfield, Va., as Report No. Docket 50389-69; $7.60 per copy, $1.45 microfiche. Report No. Docket 50389-69, May 1974. 301 p, 48 fig, 39 tab, 104 ref, 4 append.

Descriptors: *Atlantic Ocean, *Nuclear powerplants, Effluents, Environment, Administrative agencies, Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *Florida.
Identifiers: *Pressurized water reactors, *St. Lucie(Fla), *Environmental impact statements.

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the proposed construction of the St. Lucie Plant, Unit 2. The plant is located on Hutchinson Island on the east coast of Florida approximately midway between the cities of Fort Pierce and Stuart and will employ a pressurized water reactor cooled by water pumped from and discharged to the Atlantic Ocean. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary are compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion is to issue a construction permit for the plant subject to stipulated conditions for the protection of the environment. These conditions concern screening to minimize sky shine, replanting of dune, minimize adverse effects of construction by analysis of the problem and submission of a plan of action to eliminate or reduce harmful effects. (Houser-ORNL)

PROTOCOL FOR EVALUATING THE NITROGEN STATUS OF LAKE SEDIMENTS,
Wisconsin Univ., Madison. Dept. of Soil Science.
D. R. Keeney.
Copy Available from GPO Sup Doc as EP1.23:660/3-73-024, $0.65; microfiche from NTIS as PB-233 138 $1.45. Environmental Protection Agency, Ecological Research Series Report EPA-660/3-73-024, February 1974. 25 p, 2 fig, 35 ref. EPA Project 16010 EHR Grant R-801362.

Descriptors: *Lakes, *Lake sediments, *Water chemistry, *Eutrophication, *Nitrogen, Nitrification, Denitrification, Mineralization, Nitrogen fixation, *Wisconsin.
Identifiers: Lake rehabilitation, Lake survey, Nitrogen sinks, Immoblization.

The approach and methodology to evaluate the nitrogen status of lake sediments, with the ultimate aim of estimating their role as a nitrogen source or sink to the overlying waters, is outlined. The information is derived from five years of research effort on the forms, amounts and transformations of nitrogen in lake sediments. The suggested approach involves monitoring or comparative characterization, or both, of the forms of nitrogen in lake sediments, along with laboratory tests to assess the relative rates of various key nitrogen processes such as nitrification, denitrification, mineralization and immobilization. EFFECT OF ENVIRONMENTAL FACTORS ON LAKE ZOOBENTHOS IN THE SOUTHERN PART OF WESTERN SIBERIA (IN RUSSIAN),
Novosibirsk Siberian Research Inst. of the Fish Industry (USSR).
L. A. Blagovidova.
Gidrobiol Zh, Vol 9, No 1, p 55-61, 1973. English summary.
Identifiers: *Benthos, Biomass, Chironomids, *Environmental effects, Fish, Lakes, Larvae, Leech, Mineralization, Mollusks, Production, *USSR(Siberia), *Zoobenthos, Aquatic insects

Data obtained from investigation of 20 lakes in the forest-steppe and steppe regions of Western Siberia (USSR) and data from the literature for 1920-1930 showed that a long period with lack of water in many lakes resulted in a considerably decreased water level, increased mineralization and decreased specific composition and biomass of the benthos (Mollusks, chironomids, leeches, insect larvae), with decreased fish production. Benthos biomass did not change in lakes with stable level conditions. Reclamative measures are suggested to maintain stable water conditions.--Copyright 1973, Biological Abstracts, Inc.

BIOCOENOSES OF THE PALUSTRINE BODIES OF WATER OF THE SOUTHERN PART OF THE LAKE ONEGA-WHITE SEA WATERSHED, (IN RUSSIAN),
N. A. Belousova, and Z. I. Filimonova.
Ekologiya, Vol 4, No 1, p 32-35, 1973.
Identifiers: *Biocenoses, Lakes, Palustrine environment, Aquatic animals, Watersheds(Basins), *USSR(Lake Onega-White Sea), Aquatic plants, *Marshes, *Swamps.

The biocoenoses of small bodies of water in swamps differing in trophicity in the southern part of the Lake Onega-White Sea watershed (Karelia, USSR) were studied. The swamp expanses, bodies of water located on them, and the geobotanic and faunistic characteristics of the latter are described. The species composition for the aquatic fauna, also the numerosity of the leading groups and individual components are presented. The character and degree of development of the microfauna depend on the development of the hydrographic network in the swamps from the time of formation of the body of water and its overgrowth. The qualitative composition of the aquatic fauna can serve as one of the factors determining the history of formation of a swamp.--Copyright 1973, Biological Abstracts, Inc.

BENTHOS IN ARAKUM BODIES OF WATER (IN RUSSIAN),
Kaspiiskii Nauchno-Issledovatelskii Institut Rybnogo Khozyaistva, Makhachkala (USSR).
M. K. Guseinov.
Gidrobiol Zh. Vol 9, No 2, p 80-86, 1973. Illus. English summary.
Identifiers: *Benthos, Productivity, *Seasonal, *USSR, Terek River, Aquatic animals, *Biomass, Estuarine environment.

Arakum (USSR) water bodies, situated within the estuarine part of the Terek river, showed fair stability of benthos species composition, its biomass and seasonal dynamics for the last 3 yr (1967-1969). It is suggested that bottom fauna formation stabilized in 1967, the third year of the water bodies existence. The low level of productivity depends on the lack of organic detritis content.--Copyright 1973, Biological Abstracts, Inc.

FORMATION OF GAS CONDITIONS IN THE VILYUI RESERVOIR, (IN RUSSIAN),
Akademiya Nauk SSSR. Yakutsk. Institut Biologii.
T. M. Labutina.

Gidrobiol Zh. Vol 9, No 1, p 16-22. 1973. Illus. English summary).
Identifiers: *Anaerobic conditions, Carbon, Dioxide, Distribution patterns, *Gas conditions, Organic matter, Reservoirs, Seasonal, Stratification, *USSR(Vilyui reservoir), Dissolved oxygen.

Data are presented on the content and seasonal distribution of O2 dissolved in water and free CO2 over the aquatorium of the Vilyui reservoir (USSR) in the period of the reservoir formation. The reservoir is situated in the region of permafrozen soils (Western Yakutia). Essential changes in gas conditions and well pronounced vertical stratification of gas are observed. A slight flowage of the reservoir and the presence of a great quantity of flooded organic remains caused origin of large areas with anaerobic zones.--Copyright 1973, Biological Abstracts, Inc.

BIOLOGICAL UPTAKE AND DISTRIBUTION OF LEAD IN ANIMALS,
Illinois Univ., Urbana.
A. Abdelnour.
In: Cycling and Control of Metals; Proceedings of Environmental Resources Conference, October 31-November 2, 1972, Columbus, Ohio: Environmental Protection Agency National Environmental Research Center, p 55-59, February 1973. 8 fig, 1 ref. NSF Grant GI-26 NSF RANN Grant GI-1605.

Descriptors: *Lead, *Path of pollutants, Mathematical models, *Biochemistry, Metabolism, Poisons, Heavy metals, Biological properties, Water pollution effects, *Absorption.
Identifiers: *Biological uptake(Heavy metals).

Models are able to predict the uptake, accumulation and distribution of trace metal contaminants in living organisms. These models, when coupled with studies on effects and alterations that these contaminants might inflict on the environment and its components, are extremely valuable to the decision maker. The body is divided into as many organs of interest as desired, and different types of input are considered. It is assumed that the transfer of the contaminant, namely lead, within the animal is accomplished via the blood and that the uptake and elimination of the contaminant follow a first order law. This implies that the instantaneous transfer rate from any given organ is directly proportional to the amount present in the organ. Mass equilibrium is satisfied at any given organ, and for the body as a whole. The mathematical model describing the uptake and elimination of lead is given by a set of first-order linear differential equations with constant parameters. Each equation states that the rate of change in accumulation within a given organ is equal to the uptake rate minus the elimination rate. (See also W74-09206) (Knapp-USGS)

PACIFIC NORTHWEST LABORATORY ANNUAL REPORT FOR 1973 TO THE USAEC DIVISION OF BIOMEDICAL AND ENVIRONMENTAL RESEARCH - PART 2, ECOLOGICAL SCIENCES,
Battelle-Pacific Northwest Lab., Richland, Wash. Environmental and Life Sciences Div.
W. E. Vaughan.
Available NTIS, Springfield, Va., as BNWL-1850, Pt. 2; $7.60/copy, $1.45/microfiche. Report No. BNWL-1850, Pt. 2, January 1974. 210 p, 60 fig, 55 tab, 187 ref.

Descriptors: *Ecology, *Ecosystems, *Research and development, *Freshwater, *Sea water, *Radioactivity, *Radioecology, Physics, Instrumentation, Biology, Land resources, Water resources, Plutonium, Radioactivity effects, Radioactive waste disposal, Public health, Food chains.

This report is concerned with research in land and freshwater sciences and marine sciences programs. Within these activities the following sciences are involved: (1) Radiological sciences; (2) physics and instrumentation; (3) biology; (4) water and land resources; and (5) ecological systems. During the year an extensive body of data has been assembled in the terrestrial ecology programs, a major part of which has been made computer retrievable, and preliminary modelling schemes tested. Additional effort was made in modelling specific ecosystems. A new plutonium program concerned with the comparative behavior of americium, plutonium, and the other main transuranium elements was commenced. A wide range of studies on the transuranium elements is in progress covering transport, food chain, health, fuel cycle, and production or waste management aspects. ANALYSIS OF NATURAL SYSTEMS,
Battelle-Pacific Northwest Lab., Richland, Wash. Environmental and Life Sciences Div.
L. L. Eberhardt, R. O. Gilbert, J. M. Thomas, and M. I. Cochran.
In: Report BNWL-1850, Part 2, p 1-17, January 1974. 4 fig. 3 ref.

Descriptors: *Systems analysis, *Statistical models, *Ecosystems, Ecology, *Nuclear powerplants, *Effluents, *Water pollution, Air pollution, Fallout, Soil contamination, Absorption, Sampling, Cycling nutrients, Food chains, Transfer, Ion exchange, Path of pollutants, Dairy industry, Plutonium, Statistics, Mathematical studies, Public health.

Long-term efforts to understand the quantitative aspects of natural systems are continuing, with a considerable emphasis on the ecological aspects of the development of nuclear power. Recent emphasis on sampling for contaminants has been brought to the point where an exposition of certain basic aspects is feasible, and one such report was presented to the International Statistical Institute's 39th Session in Vienna last August. Efforts to model ecological systems have concentrated on radionuclide cycling and transfers, and much of the effort was devoted to appraisal of a dairy farm study. Appraisals of various statistical and mathematical aspects of ecology continued along the lines of past years, with the addition of an effort to produce a bibliography of quantitative methods in ecology. FRESHWATER ECOLOGY,
Battelle-Pacific Northwest Lab., Richland, Wash. Environmental and Life Sciences Div.
C. D. Becker, R. G. Genoway, M. J. Schneider, C. E. Cushing, and D. G. Watson.
In: Report No. BNWL-1850, Pt. 2, p 57-100, January 1974. 21 fig, 11 tab, 24 ref.

Descriptors: *Freshwater, *Ecology, *Temperature, Environment, *Aquatic plants, *Aquatic animals, Biota, Fish, Water pollution, Tritium, Radioactivity, Biology, Geochemistry, Animal physiology, Plant physiology, Radioactivity effects, Radioactive waste disposal, Cycles, Ecosystems.

Studies are reported for effects of thermal discharges on aquatic biota and on fish behavior and sensory physiology, including combined effects of temperature, pollutants, and disease; effects of tritium on aquatic environments; and factors affecting biogeochemical cycling. Interaction of temperature with other environmental stresses and the relationship of temperature to physiological requirements are integral parts of this research program. Also consideration is given to the combined effects of temperature, chemical additives, e.g., biocides and corrosion inhibitors. The more radiosensitive embryonic and larval life stages of the aquatic environment were studied for the effects of tritium. The Columbia River and McNary Reservoir ecosystems were studied to determine the effects of ecosystems receiving radioactive wastes. (See also W74-09233) (Houser-ORNL)
W74-09236

MARINE SCIENCES,
Battelle-Pacific Northwest Lab., Richland, Wash. Environmental and Life Sciences Div.
W. B. Silker, D. E. Robertson, J. R. Van der Horst, R. Y. Ting, and C. W. Apts.
In: Report No. BNWL-1850, Pt. 2, p 101-120, January 1974. 2 fig, 7 tab, 5 ref.

Descriptors: *Marine biology, *Aquatic life, Environment, *Nuclear powerplants, *Effluents, *Water pollution, Radioactive waste disposal, Radioactivity effects, Ecosystems, Oily water, Oil spills, Geochemistry, Physiochemical properties, Physical properties, Chemical properties, Radiochemical analysis, Oceans.

Efforts in the marine sciences are geared towards a better understanding of man's impact upon the environmental quality of the oceans. Radioactivity, anthropogenic pollutants, oil, and thermal discharges are waste products of an industrial society which enter the marine environment. The physical, chemical and biological interactions of these additions are being characterized to predict their potential detrimental effects in the oceans. The basic chemical and mixing processes in the ocean are being investigated to understand and determine how anthropogenic additions to the marine environment interact and disperse. Research on the thermal resistance of selected marine organisms and the effects of crude oil on marine intertidal communities are being conducted at the Marine Research Laboratory, Sequim, Washington. (See also W74-09233) (Houser-ORNL)
W74-09237

RADIOLOGICAL SCIENCES,
Battelle-Pacific Northwest Lab., Richland, Wash. Environmental and Life Sciences Div.
C. E. Jenkins, J. C. Langford, D. E. Robertson, G. W. R. Endres, and C. W. Thomas.
In: Report No. BNWL-1850, Pt. 2, p 121-132, January 1974. 3 fig, 1 tab, 10 ref.

Descriptors: Environment, *Radioactivity, *Measurement, *Public health, *Assay, Research and development, *Human population, Iron, Marine microorganisms, Seawater, Assessment, Altitude, Analytical techniques, Mercury, Trace elements, Stable isotopes, Cesium, Animal pathology, Environmental effects.

Studies are reported on radiological-health, iron-55 in human populations, radio-analytical procedures, and fate and effects of radionuclides in Alaska. Efforts continued in measurements of the decline of radioactivity in various population groups. Studies in iron-55 concentrations revealed specific activities increased 10 to 30 fold in salmon between mid and northern altitudes. Procedures have been developed to measure specific elements

such as Hg found to co-exist with certain trace radioactive or stable constituents. Comparison of radionuclide concentrations in rumen contents and muscle tissue of caribou from Anaktuvuk Pass and Kobuk River regions during 1972-1973 winter seasons show that in Kobuk caribou Cs-137 concentrations are two to three times higher. W74-09238

TERRESTRIAL ECOLOGY,
Battelle-Pacific Northwest Lab., Richland, Wash. Environmental and Life Sciences Div.
J. F. Cline, W. H. Rickard, D. W. Uresk, J. D. Hedlund, and W. T. Hinds.
In: Report No. BNWL-1850, Pt. 2, p 133-171, January 1974. 21 fig, 11 tab, 13 ref.

Descriptors: Environment, *Ecology, Ecosystems, Research and development, *Biota, *Animal populations, *Speciation, *Plant populations, Primary productivity, Food chains, Soil contamination, Absorption, Transfer, Ion transport, Root systems, Burrows, Radioactivity effects, Radioactive waste disposal, Water pollution, Cycling nutrients, Model studies, Decaying organic matter, *Washington.

Terrestrial studies continue to contribute ideas and ecological data relevant to nuclear-power plant siting and the management of stored radioactive wastes in the semi-arid steppe region of Washington. These ideas and data are also largely applicable to steppe regions of Oregon, Idaho, and Nevada. Much of the available information concerning the ecology of steppe ecosystems has been gathered within the boundaries of the Arid Land Ecology Reserve, a place where long-term studies can be initiated with great assurance that the studies will not be interrupted by changing land use priorities. Today the concept of an ecological research area needs to be considered for waste management areas where opportunities are available to study the ecological behavior of radionuclides in the absence of resident human populations. These studies are relevant with the knowledge that rad-wastes will increase as a result of an expanding market for nuclear fueled power plants. This report reflects the integration of terrestrial ecology studies. Papers are grouped under the headings: energy and water relations, mineral nutrients, manipulation studies, consumers, primary producers, radiation studies, and modelling. (See also W74-09233) (Houser-ORNL)
W74-09239

5D. Waste Treatment Processes

MODELING OF HYDROLOGIC PROCESSES AND WATER SALVAGE PROCEDURES IN SEMIARID REGIONS,
Arizona Univ., Tucson. Water Resources Research Center.
S. D. Resnick.
Available from the National Technical Information Service as PB-232 834; $3.00 in paper copy, $1.45 in microfiche. Partial Technical Completion Report, December 1973. 7 p, 3 ref. OWRR A-020-ARIZ(8). 14-31-0001-3203.

Descriptors: *Arizona, *Water management(Applied), *Salvage value, Model studies, *Water reuse, Water costs, *Water utilization, Semiarid climates, Waste water treatment, Water quality standards, *Cost-benefits analysis.
Identifiers: *Tucson(Ariz).

Potential uses or reuses of salvageable waters in the Tucson region were examined, and costs and benefits related to such uses were evaluated. The quality of salvageable waters as determined in exploratory sampling was compared with water quality standards and criteria appropriate for agricultural, recreational and selected industrial uses. A tableau was then constructed which showed the type and estimated cost of conventional water treatment that would be required for each source-to-use combination. Finally, an estimate was made of unit net benefits to be anticipated from salvageable water input to these uses, and the net benefits were applied in several test calculations to illustrate mixed allocations of the various salvaged waters to the selected uses.

TREATMENT OF BEET FACTORY-WASTE WATER BY ACTIVATED SLUDGE PROCESS (BIOSORPTION PROCESS), (IN JAPANESE),
Hokkaido Sugar Co. Ltd. (Japan).
M. Nogai.
Proceedings of the Research Society of Japan Sugar Refineries's Technologists, Vol 24, No 24, p 25-35, August 1973. 3 fig, 5 tab, 7 ref. English summary.

Descriptors: *Waste water treatment, *Water purification, *Recycling, *Activated sludge, Biochemical oxygen demand, Sugar beets, Industrial wastes, Design standards, Operation and maintenance, Hydrogen ion concentration, Temperature.
Identifiers: *Japan, Bulking, Phosphoric acid.

The purification of the waste water of the Honbetsu beet sugar factory by an activated sludge process is described. The process was effectively operated for four years, even in outdoor temperatures of -28C. The design standards of the installation are described. The recycle ratio of sludge was more than 70%. Since the capacity of the clarifier was insufficient, it was necessary to increase the up flow rate in the clarifier over the design rate. The dissolved oxygen in the sludge aeration tanks was 0.4-0.6 ppm. The expected minimum elimination of BOD5 was attained at 13C. The pH level of waste water should be kept at 6-9. The elimination ratio BOD5 obtained was 60-70% of the expected ratio. The excess sludge in running and final sludge were collected in a final pond, and they were decomposed by digestion in summer. When there was a fluctuation of pH value and a drop in waste water temperature, the activated sludge underwent bulking. The bulking stopped with the addition of phosphoric acid and it is concluded that soil adhering to beets and the beets themselves contain some nutrients that effectively activate the sludge. (Merritt-FIRL)
W74-08777

STUDIES OF RENOVATION OF PULP MILL WASTEWATER PILOT PLANT TESTS FOR GRANULAR ACTIVATED CARBON ADSORPTION OF KRAFT PULP MILL WASTEWATER, (IN JAPANESE),
Government Industrial Research Inst., Sikoku (Japan).
H. Kabeya, T. Fujii, and Y. Kimura.
Japanese Technical Association Industry Journal, Vol 27, No 11, p 543-553, November 1973. 10 fig, 7 tab, 7 ref. English summary.

Descriptors: *Pulp wastes, Investigations, *Adsorption, *Activated carbon, Lignins, Chemical oxygen demand, Activated sludge, Lime, *Waste water treatment.
Identifiers: *Japan.

Pilot plant tests for adsorption on granular activated carbon were conducted with lime treated water of unbleached kraft pulp wash waste water (lignin concentration 12-26 ppm, COD 25-44 ppm) and pretreated water of bleached kraft pulp caustic soda extract waste water (lignin concentration 33-120 ppm), treated by activated sludge and followed by lime. The possibility of renovation of these treated waters was investigated. At a superficial velocity of 1.7 m/hr and contact time of 140 min, the carbon usages of lime treated water were 3530 liter/kg air-dried carbon on the basis of lignin breakthrough curve and 3090 liter/kg air-dried carbon on the basis of COD breakthrough curve. The adsorption of lignin on activated carbon by lime treatment increases, but the adsorption of COD hardly increases. These results are consistent with the results obtained from adsorption isotherms of lime treated water and dilute water. Similarly, the carbon usage of pretreated water of caustic soda extract waste water was 130 liters/kg air-dried carbon on the basis of lignin breakthrough curve. (Merritt-FIRL)
W74-08778

DEVELOPMENT TRENDS IN POLLUTION-FREE PROCESSES.
Chemical Economy and Engineering Review, Vo 5, No 67, p 59-60, November, 1973. 2 tab.

Descriptors: *Recycling, *Industrial production, *Pollution abatement, Sewage, *Water reuse, Waste water treatment.
Identifiers: *Japan.

The development of closed systems of production in Japan as a method of pollution control is discussed. Central to this system is the recycling of materials used in the production process. According to a survey made by the Agency of Industrial Science and Technology, the process accounts for 31.9% of pollution abatement devices now being developed. The share is likely to increase to 42.5% five years later. There are plans to recover urban sewage as industrial water or to utilize gypsum by-produced from the desulfurization of flue gas. The closed system is designed to prevent secondary and tertiary pollution. As such it is part of a comprehensive system of pollution control. Efforts to clean the environment also involve attempts to change the sources of heat and some of the raw materials and, more importantly, to change the nation's industrial structure. (Merritt-FIRL)

HERE AND THERE.
Effluent and Water Treatment Journal, Vol 13, No 12, p 751-752, December, 1973.

Descriptors: *Effluents, *Water treatment, Industrial wastes, *Sewage disposal, Land use, Sludges, Dewatering, Organizations, Polymers, Polyelectrolytes, Flocculation, Water purification, Potable water, *Waste water treatment.

Research and newsbriefs on effluent and water treatment throughout the world are summarized. The question whether industry should use public sewers or provide its own treatment plants is being debated. There is renewed interest in the United States in the use of land as a means of disposing of sewage. The growth of the use of synthet

polymers in the dewatering of sludges illustrates that it takes a long time to prove the worth of chemicals that are gradually replacing those inorganic chemicals and precipitants and flocculants that greatly increase the amount of sludge to be handled. A consultant group convened by the WHO International Reference Centre for Community Water Supply recommends that polyelectrolytes should be employed in the purification of water for public supply only after careful consideration of possible toxic hazards. The Water Research Association and the Testing and Research Institute of the Netherlands Water Undertakings will hold a conference to discuss improvements in techniques for the distribution of drinking water. (Merritt-FIRL)
W74-08785

TURNKEY CONTRACTS FOR SEWAGE TREATMENT PLANTS,
S. Pinnell.
Civil Engineering-ASCE, Vol 44, No 1, p 86, January, 1974.

Descriptors: *Contracts, *Sewage treatment, Costs, Utilities, *Waste water treatment, *Treatment facilities.
Identifiers: Turnkey contracts.

The disadvantages of turnkey contracting procedures for sewage treatment plants are summarized. Conventional contracting can provide better organization of pollution control efforts. The direct costs of turnkey contracting will normally be substantially higher than conventional contracting. Turnkey contracting does not generally result in design innovation unless special provisions are written into the design construction contract. Turnkey contracts would tend to limit competition to large design constructors. This restriction is too serious to justify the use of turnkey contracting in public works, especially when other contractual arrangements or improvements in conventional contracting could produce similar time reduction and at less cost. (Merritt-FIRL)
W74-08786

RESEARCH ROUND UP.
Effluent and Water Treatment Journal, Vol 13, No 12, p 791, December, 1973. 1 fig.

Descriptors: *Waste water treatment, *Water treatment, *Denitrification, Nitrogen, Packed beds, Nitrilotriacetic acid, Investigations, Bacteria, Sludge, Activated sludge, Sand, Filtration, Coals, Sluries, Canada.
Identifiers: England, India, Mutants.

Current research in waste and water treatment is summarized. Studies on the kinetics of packed bed denitrification at the University of California concluded that the denitrification process can be operated near the maximum unit removal rate and still obtain acceptable nitrogen conversion, regardless of the reactor configuration. A bacterial mutant was isolated at the Canadian Centre for Inland Waters from waste water after ultraviolet mutagenisation and penicillin selection and was shown to have higher affinity for nitrilotriacetic acid using concentrations up to 2.5 percent as sole carbon, nitrogen, and energy source over a wide temperature and pH range, without acclimatization. At the National Environmental Research Center in Cincinnati, pilot-plant experiments on the effect of waterworks sludge on the activated sludge process show there are no adverse effects. The Central Public Health Engineering Research Institute at Nagpur successfully substituted bituminous coal for anthracite for use with sand for dual media filtration. (Merritt-FIRL)
W74-08787

DIRECT FILTRATION: AN ECONOMIC ANSWER TO A CITY'S WATER NEEDS,
Springfield Municipal Water Works, Mass. Water Dept.
G. E. Sweeney, and P. W. Prendiville.
Journal of the American Water Works Association, Vol 66, No 2, p 65-71, February, 1974. 4 fig.

Descriptors: *Municipal water, *Filtration, *Waste water treatment, Water works, History, *Massachusetts, *Treatment facilities, Costs, Water treatment.
Identifiers: *Springfield(Mass).

The history of the Springfield, Mass., water system and the background of engineering investigations are described. The first community water supply in the city was developed in 1848. The city took over operations in 1872, and the reservoir had a yield of 10 mgd. The total average daily water consumption increased from 17 mgd in 1940 to 41 mgd in 1971. Currently about 33% of the supply is used by industry. An engineering report of 1970 recommended the immediate construction of a 60 mgd direct filtration plant, to be operated in conjunction with the slow sand filters. It was also recommended that the new facilities be designed to facilitate expansion of the plant to an ultimate capacity of 180 mgd. The report set a reasonable budget and schedule for the project. The plant is scheduled to go into operation in early 1974. The construction cost of the direct filtration facilities is now estimated at about $88,000/mil gal of capacity, considerably lower than expected for a plant of this size. (Merritt-FIRL)
W74-08788

PHOSPHATE REMOVAL BY MAGNETIC FILTRATION,
Harvard Univ., Cambridge, Mass. Div. of Engineering and Applied Physics.
G. Bitton, R. Mitchell, C. de Latour, and E. Maxwell.
Water Research, Vol 8, No 2, p 107-109, 1974. 2 fig, 2 tab, 12 ref.

Descriptors: *Phosphates, Investigations, *Filtration, Sampling, Color, Rivers, *Separation techniques, Suspended solids, Tertiary treatment, Clays, Montmorillonite, Effluents, *Massachusetts, *Waste water treatment.
Identifiers: *Charles River(Mass), *Magnetic separation, Magnetite, Alum.

The removal of phosphate from natural water by magnetic separation was investigated under carefully controlled conditions. Water from the Charles River, Boston, was sampled at three different locations and was treated by magnetic filtration to reduce its phosphate content. The removal of phosphorus approached the 90 percent level in the three locations. The suspended solid content and the color of the Charles River samples were reduced significantly. The effluents obtained by magnetic filtration were all very clear and did not contain any trace of montmorillonite. It is concluded that magnetic filtration is a rapid process that requires only a few minutes retention after the addition of magnetite, alum, and clay to the water samples. The process could be used as an alternative to settling tanks in the tertiary treatment of wastes. (Merritt-FIRL)

W74-08790

TALE OF TWIN CITIES, CUTTING THE HIGH COSTS OF POLLUTION CONTROL.
Instrumentation, Vol 27, No 1, p 12-15, 1974. 5 fig.

Descriptors: *Waste water treatment, *Sewage treatment, Aeration, Sludge disposal, Incineration, Effluents, Chlorination, Flow, *Treatment facilities, *Minnesota.
Identifiers: *St. Paul(Minn), *Minneapolis(Minn).

The centralized waste water treatment facility of the Twin Cities area in Minnesota is described. It serves a 3000 sq mile area with a population of over 2 million people and a commercial/industrial population equivalent to an additional million persons. The plant is completely integrated, meaning that its processes include secondary as well as primary treatment, sludge incineration, and chlorination of the effluent prior to discharge into the Mississippi River. Average flow capacity through the plant is 218 mgd. A major expansion program over the next five years will boost this to 290 mgd in a first step, with a potential flow capacity of 350 mgd in the long range future. (Merritt-FIRL)
W74-08796

THE INVESTIGATION OF BIODEGRADABILITY OF BRANCHED NONYL PHENOL ETHOXYLATES,
Swedish Water and Air Pollution Research Lab., Stockholm.
L. Rudling, and P. Solyom.
Water Research, Vol 8, No 2, p 115-119, 1974. 4 fig, 2 tab, 7 ref.

Descriptors: *Activated sludge, Investigations, *Biodegradation, *Phenols, Municipal wastes, Sewage, Surfactants, *Waste water treatment.
Identifiers: *Sweden, *Nonyl phenol ethoxylates.

The biodegradability of branched chain nonyl phenol ethoxylates was investigated according to a screening test procedure recommended by Organization for Economic Cooperation and Development (OECD). Also a study was conducted in a laboratory-scale activated sludge system operated with presettled municipal sewage under treatment plant conditions. The results show that there is no significant difference between the biodegradability of the different nonyl phenol ethoxylates containing 8-30 ethylene oxide groups. The removal of surfactants exceeds 90% and no acclimatization was needed in activated sludge treatment under plant conditions. (Merritt-FIRL)

TRANSIENT ANALYSIS OF A STATE PARK EXTENDED AERATION WASTEWATER FACILITY,
Maryland Univ., College Park. Dept. of Chemical Engineering.
W. W. Hellier, Jr., and T. W. Cadman.
Available from the National Technical Information Service as PB-232 957 $5.75 in paper copy, $1.45 in microfiche. University of Maryland Water Resources Research Center Technical Report No 24, (1973) 186 p, 44 fig, 3 tab, 151 ref, 3 append. OWRR A-021-MD (1), 14-31-0001-3520. *Waste water treatment, Treatment facilities, Biological treatment, *State parks, *Pennsylavnia, *Aeration, *Biochemical
Identifiers: *Extended aeration, Prince Gallitzin St. Pk.(Penn).

Experimental data on the transient operation of the extended aeration wastewater treatment plant at Pennsylvania's Prince Gallitzin State Park have been collected and the system has been mathematically modeled. Time-variant inlet hydraulic flows were obtained through continuous measurement, and organic loading data were based on grab samples analyzed for biochemical oxygen demand (BOD) and volatile suspended solids concentration. Effluent BOD was used as the criterion for comparing the predicted with the observed time-variant plant response to loadings. Three mathematical models were developed for the simulations. The first represented the plant as well mixed

system with BOD destruction given by first order kinetics. The second represented the plant as a series of equal volume well mixed stages, with all BOD in solution and being destroyed by a first order kinetic reaction. The third represented the plant as a well mixed system with BOD both in solution and in the suspended solid phase. Direct destruction of dissolved and solid BOD was considered to be by separate first order kinetic reactions. A second-order conversion of solid to dissolved BOD was also assumed. The well mixed model is selected as the preferred model based upon the data now available for the system.
W74-08838

DEVELOPMENT OF A HIGH PRODUCT WATER RECOVERY SYSTEM FOR THE TREATMENT OF ACID MINE DRAINAGE BY REVERSE OSMOSIS,
Envirex, Inc., Milwaukee, Wis. Environmental Sciences Div.
M. K. Gupta.
Available from the National Technical Information Service as PB-230 756/AS, $6.25 in paper copy, $1.45 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-939, March 1974. 51 p, 7 fig, 11 tab, 14 ref. OSW Contract 14-30-3020.

Descriptors: *Demineralization, *Desalination, Descaling, Membrane process, Membranes, Pilot plants, *Reverse osmosis, Saline water, Scaling, Ion exchange, Water reuse, *Waste water treatment, *Mine drainage, Acid mine water, Neutralization, *Water softening.
Identifiers: Sodium hexameta-phosphate, Membrane fouling, Citric acid, Soda ash softening, Sodium aluminate softening, Carbon dioxide softening, Ion exchange softening, Sludge recycling, Cost estimate.

The objective was to develop a high product water recovery reverse osmosis (RO) system for the treatment of acid mine drainage. Depending on raw water quality the overall water recovery was limited to about 95% because of the buildup of saturation concentrations of calcium sulfate. Brines saturated with CaSO4 were produced via a portable RO unit employing hollow fiber B-9 membranes for a number of neutralization and softening tests. Various alkaline agents such as lime, limestone, sodium hydroxide and soda ash were evaluated for the neutralization of the brines produced from the first stage RO processing of raw acid mine waters. The presence of ferric iron in the feed above a pH level of 2.6 contributed to the fouling of the membranes. Addition of sodium sulfite aided in reducing the iron to the ferrous state. Biochemical oxidation and limestone-lime combination treatment to a pH of 10.8 was concluded to be the most suitable and economic method of neutralization. Treatment costs for a 10 million GPD capacity plant were: 15.7 cents per 1000 gallons - capital costs; and 59 cents per 1000 gal - operating costs. (OSW)

PHOSPHORUS REMOVAL DESIGN SEMINAR, CONFERENCE PROCEEDINGS NO. 1.
Environmental Protection Service, Ottawa (Ontario).
Research Program for the Abatement of Municipal Pollution under Provisions of the Canada-Ontario Agreement on Great Lakes Water Quality, Conference held May 28-29, 1973, Toronto, Canada. 359 p. (1973).

Descriptors: *Phosphorus compounds, *Waste water treatment, Treatment facilities, Biological treatment, Sludge treatment, Information exchange, *International Joint Commission, Activated sludge, Design criteria, Sewage treatment, *Research and development, *Canada.
Identifiers: *Phosphorus removal.

In response to the International Joint Commission recommendations, the Canadian federal government and the government of Ontario signed an agreement in August, 1971. Under the terms of the Canada-Ontario Agreement on Great Lakes Water Quality, the two governments undertook to accelerate the construction of pollution control facilities in the Great Lakes Basin, and provide funding for treatability studies and research designed to improve pollution control technology. The province of Ontario and Ontario municipalities are presently involved in a five-year program to control, by 1975, phosphorus discharges from more than 200 existing wastewater treatment plants serving some 4.7 million people. For the most critically affected areas of the province, permanent phosphorus removal facilities must be operational by December 31, 1973. In view of this deadline and the fact that the development of design parameters for phosphorus removal facilities is in its infancy it became apparent that a seminar of this nature should be of considerable assistance to those involved in the design of these facilities. This seminar was intended to provide an exchange of information between consulting engineers and government personnel involved in the design and approval of phosphorus removal facilities at waste treatment plants. PHOSPHORUS REMOVAL IN ONTARIO,
Ministry of the Environment, Toronto (Ontario). Sanitary Engineering Branch.
G. L. Van Fleet.
In: Phosphorus Removal Design Seminar, Conference Proceedings No 1, (1973). 25 p, 1 fig, 6 ref.

Descriptors: *Research and development, *Waste water treatment, *Treatment facilities, *Methodology, Data collections, Design criteria, Economics, Efficiencies, Chemical precipitation, *Canada.
Identifiers: *Phosphorus removal.

The integration of chemical treatment into existing waste water treatment plants in Ontario has necessitated the development of a research methodology capable of providing in a very short time period sufficient design information to successfully implement the Province's phosphorus removal program. This methodology has involved both treatability studies and intensive research investigations. The treatability studies are proceeding at all waste water treatment plants requiring phosphorus removal and it is expected that the resultant data will contribute to the design of the most efficient and economical chemical process for each particular plant within the required timing. Research and demonstration projects have made it possible to demand permanent facilities to meet the required percent phosphorus removal or effluent quality criteria. Continuing investigations will produce more accurate information on sludge handling and disposal and will improve upon existing waste water treatment technology. (See also W74-08846) (Sandoski-FIRL)
W74-08847

GUIDELINES FOR CONDUCTING TREATABILITY STUDIES FOR PHOSPHORUS REMOVAL AT WASTEWATER TREATMENT PLANTS.
Ministry of the Environment, Toronto (Ontario).
In: Phosphorus Removal Design Seminar, Conference Proceedings No 1, (1973). 24 p, 1 fig, 2 tab.

Descriptors: *Waste water treatment, *Treatment facilities, Investigations, Coagulation, Chemical treatment, Pilot plants, Methodology, Sludge disposal, Sludge treatment, *Canada.
Identifiers: *Phosphorus removal, *Investigation guidelines.

An information brief for consulting engineers and municipal officials as well as a supplement to Guidelines For Initiating Treatability studies is given. These guidelines are designed to assist personnel involved in carrying out phosphorus removal treatability studies in determining the most efficient and economical means to implement phosphorus removal through chemical addition at existing waste water treatment plants. The methodology, which includes both jar testing and pilot study phases, allows the prediction of the prime coagulant best suited for phosphorus removal at any particular treatment facility and a determination of whether the chemical used has any affect on the existing waste water treatment process, facilities, method of sludge treatment, and subsequent sludge disposal practices. The choice of chemical is limited to the process most compatible with sewage characteristics and the existing facilities, taking into account the physical layout of the plant and the delivered cost and availability of the particular chemical. (See also W74-08846) (Sandoski-FIRL)
W74-08848

PHOSPHORUS REMOVAL BY CHEMICAL ADDITION USING PRIMARY TREATMENT,
A. Wilkes.
In: Phosphorus Removal Design Seminar. Conference Proceedings No 1, (1973). 17 p, 1 fig.

Descriptors: *Chemical precipitation, *Sewage treatment, *Phosphates, Chemical reactions, Flocculation, Methodology, *Waste water treatment, *Canada.
Identifiers: *Phosphorus removal.

Phosphorus removal by chemical addition ahead of primary clarification is a vaiable technique for controlling phosphorus discharges at sewage treatment plants. For the purposes of this study, primary treatment for phosphorus removal is defined in terms of the point of addition of chemical. The types of phosphorus compounds present in sewage such as ortho-phosphates, polyphosphates, and organic phosphates are discussed. The mechanism of phosphorus removal which includes precipitation of phosphorus compounds, chemical reactions, and solids flocculation, together with practical considerations and experience are mentioned. (See also W74-08846) (Sandoski-FIRL)
W74-08849

CHEMICAL PRECIPITATION FOR BIOLOGICAL AND POSTBIOLOGICAL TREATMENT,
J. D. Norman.
In: Phosphorus Removal Design Seminar. Conference Proceedings No. 1 (1973). 14 p, 6 fig.

Descriptors: *Chemical precipitation, *On-site testing, *Treatment facilities, *Performance, Equipment, Effluents, Optimization, Efficiencies, *Canada, *Waste water treatment.
Identifiers: *Phosphorus removal.

Chemical precipitation at full-scale treatment plants in several plants in Ontario, Canada has been observed. Comments are made on some of the factors (chemical choice, point and rate of application, control of chemical feed, and the effect of plant operation) affecting the performance of chemical precipitation processes and the effect or lack of effect of several variables tested. Conclusions suggest the following: chemical solutions are not difficult to obtain, the jar testing procedure is consistent for a given waste, equipment for chemical application is inexpensive and portable, systems should also provide improved effluent quality, and system optimization requires a longer testing period than eight weeks. (See also W74-08846) (Sandoski-FIRL)
W74-08850

PHOSPHORUS REMOVAL IN SEASONAL RETENTION LAGOONS BY BATCH CHEMICAL PRECIPITATION,
Ministry of the Environment, Toronto (Ontario).
H. J. Graham, and R. B. Hunsinger.

In: Phosphorus Removal Design Seminar, Conference Procedings No. 1 (1973). 25 p, 4 fig, 1 tab, 12 ref.

Descriptors: *Aluminum, *lime, *Chlorides, *Iron, *Testing, *Chemical precipitation, Effluents, Phosphorus, Biochemical oxygen demand, Performance, *Canada, *Waste water treatment.
Identifiers: *Phosphorus removal.

Alum, ferric chloride, and lime have been tested as a means of phosphorus removal in the batch chemical treatment of seasonal retention lagoons. The required dosages were determined by jar tests, a highly reliable method in predicting the post-treatment results in a lagoon. Lagoon discharge was usually begun the day after treatment and continued for an average of eight days. Both alum and ferric chloride produced a high quality effluent, low in phosphorus and BOD. The lime application initially produced a high quality effluent, but deteriorated rapidly over the drawdown period. (See also W74-08846) (Sandoski-FIRL)
W74-08851

DESIGN CONSIDERATIONS IN THE IMPLEMENTATION OF ONTARIO'S PHOSPHORUS REMOVAL PROGRAMME,
Ministry of the Environment, Toronto (Ontario). Research Branch.
B. I. Boyko, and J. W. G. Rupke.
In: Phosphorus Removal Design Seminar, Conference Proceedings No. 1 (1973). 34 p, 8 fig, 5 tab, 10 ref.

Descriptors: *Waste water treatment, Phosphorus, *On-site testing, *Treatment facilities, *Chemical precipitation, Coagulation, Activated sludge, Effluents, Anaerobic digestion, Sludge treatment, *Canada.
Identifiers: *Phosphorus removal.

The predictive methodology, operational results, problem areas, and design considerations that have resulted from the full scale phosphorus removal studies conducted at waste water treatment facilities ranging in size from 0.05 to 24.0 mgd capacity are discussed. Also, the results of studies involving phosphorus removal through continuous chemical addition to waste stabilization pond are disclosed. The following conclusions are presented: a satisfactory predictive technique was developed that allows a rational selection of lime coagulant to be used for phosphorus removal at a treatment facility; phosphorus removal was readily implemented with minimal capital expenditure; satisfactory effluent quality was attained by the activated sludge process and its modifications when phosphorus removal was practised; increased sludge production was experienced at all systems; and, anaerobic digestion of chemical sludges associated with phosphorus removal was successful with no significant phosphorus release being observed. (See also W74-08846) (Sandoski-FIRL)
W74-08852

PHOSPHORUS REMOVAL ON SECONDARY EFFLUENTS,
Environmental Protection Service, Ottawa (Ontario).
J. E. Shannon.
In: Phosphorus Removal Design Seminar, Conference Proceedings No. 1 (1973). 16 p, 7 fig, 30 ref.

Descriptors: *Chemical precipitation, Phosphorus compounds, Equipment, Biochemical oxygen demand, Mixing, Flocculation, Hydrogen ion concentration, Filtration, *Canada, *Waste water treatment.
Identifiers: *Phosphorus removal, Clarification.

Phosphorus precipitation by chemical addition to the secondary effluent requires the addition of separate equipment onto the existing facility and reduces the effluent total phosphorus levels in the order of .1 to .5 mg/liter and reduces the BOD to less than 10. Some alternatives for post-precipitation are depicted, with the individual components being flash mixing, flocculation, and clarification, or the three combined in a reactor clarifier, pH adjustment, and filtration. Design aspects of the various stages in post precipitation are discussed. (See also W74-08846) (Sandoski-FIRL)
W74-08853

SOME PLANT DESIGN CONSIDERATIONS IN PHOSPHORUS REMOVAL FACILITIES,
G. A. Aldworth.
In: Phosphorus Removal Design Seminar, Conference Proceedings No. 1 (1973). 19 p, 2 fig.

Descriptors: *Design criteria, *Phosphorus compounds, *Chemical treatment, Equipment, Corrosion, Treatment facilities, Lime, Aluminum, Chlorides, Iron, *Canada, *Waste water treatment.
Identifiers: *Phosphorus removal, Feed systems.

Described are areas related to detailed design for phosphorus removal with the following topics explored: effects of encrustation and corrosion; representative chemical feed systems; and, the effect of chemicals on plant elements such as air diffusers, pumps, tanks, and piping. Emphasized are schemes involving the storage and feeding of large amounts of chemicals received in bulk form. A summary of guidelines for the use of lime treatment and alum or ferric chloride treatment in phosphorus removal is included. (See also W74-08846) (Sandoski-FIRL)
W74-08854

PHOSPHORUS REMOVAL COSTS,
G. Powell, and P. Crawford.
In: Phosphorus Removal Design Seminar, Conference Proceedings No 1 (1973). 38 p, 9 fig, 2 tab, 8 ref.

Descriptors: *Costs, *Economic efficiency, *Waste water treatment, Lime, Sludge disposal, Data collections, Water quality control, Effluents, Treatment facilities, Chemical precipitation, *Canada.
Identifiers: *Phosphorus removal.

A significant factor to phosphorus removal costs pertaining to waste water plants is the designer's familiarity with the effect of the phosphorus removal chemicals on the treatment processes. Insufficient data are presently available for accurate costs of phosphorus sludge disposal and the effect of lime on the biological treatment at elevated hydrogen ion concentrations. As effluent standards are made more stringent to safeguard waters, treatment costs will increase. Thus, with higher and more sophisticated degrees of treatment, a better understanding of the operation and the economics of the treatment processes involved will result. W74-08855

INSTRUMENTATION AND AUTOMATIC CONTROL OF PHOSPHORUS REMOVAL PROCESSES,
Dow Chemical Co., Midland, Mich. Environmental Control Systems.
S. L. Daniels.
In: Phosphorus Removal Design Seminar, Conference Proceedings No 1 (1973). 21 p, 7 fig, 1 tab, 17 ref.

Descriptors: *Waste water treatment, *Phosphorus, *Chemical precipitation, *Flocculation, Instrumentation, *Control systems, Monitoring, Measurement, *Canada.
Identifiers: *Phosphorus removal.

Significant reductions of all phosphorus species present in municipal waste water are technically feasible in existing treatment plants before effluents are discharged into receiving waters. These reductions are accomplished by modifying conventional and flocculation processes. Instrumentation in both coagulation and flocculation processes has been limited to controlling the storage and preparation of chemicals, the metering of chemical additions, and the monitoring of influent and effluent qualities. Comparisons of typical flocculant preparation systems, flocculant addition systems, and coagulant addition systems for five ranges of total plant flow are summarized. (See also W74-08846) (Sandoski-FIRL)
W74-08856

CHEMICAL HANDLING: THE CHEMICAL FEEDER AND ITS RELATED SYSTEM WHEN APPLIED TO ALUM, FERRIC CHLORIDE, LIME AND POLYMERS,
Control and Metering Ltd., Toronto (Ontario).
T. Fahlenbock.
In: Phosphorus Removal Design Seminar, Conference Proceedings No. 1 (1973). 30 p, 7 fig, 3 tab.

Descriptors: *Chemical precipitation, *Equipment, Measurement, Design criteria, Operation and maintenance, Performance, Alum, Iron, Chlorides, Lime, *Canada, *Waste water treatment.
Identifiers: *Chemical feeder, *Phosphorus removal.

Various characteristics of the chemical feeder or metering pump including basic design, operation, accuracy, sizing, system components, stages of design development, and performance specifications, are detailed. Also discussed are the maximum and minimum feed rates for the feeder as well as its ability to handle alum, ferric chloride, dry polymers and lime. (See also W74-08846) (Sandoski-FIRL)
W74-08857

USE OF LIME FOR PHOSPHORUS REMOVAL,
Environmental Protection Service, Burlington (Ontario). Waste Water Technology Centre.
B. P. Le Clair, and E. Ladouceur.
In: Phosphorus Removal Design Seminar, Conference Proceedings No. 1 (1973). 15 p, 6 fig, 3 tab, 7 ref.

Descriptors: *Lime, *Design criteria, *Operation and maintenance, *Cost comparisons, *Waste water treatment, Chemical precipitation, *Canada.
Identifiers: *Phosphorus removal.

Process design information and operating experience on the use of lime, including the direct use of dry unslaled lime for phosphorus removal, are summarized. Of the three methods demonstrated at full scale, the method involving dry hydrated lime storage in a silo and batch continuous slurry makeup is preferred. Approximately 25 percent chemical cost saving should be realized with the method as well as fewer operating difficulties. (See also W74-08846) (Sandoski-FIRL)
W74-08858

ACTIVATED SLUDGE CHARACTERIZATION AND SETTLING,
Environmental Protection Service, Ottawa (Ontario).
R. Zaloum.
In: Phosphorus Removal Design Seminar, Conference Proceedings No. 1 (1973). 15 p, 6 fig, 6 ref.

Descriptors: *Activated sludge, Physical properties, Chemical properties, Biological properties, Investigations, *Canada, *Waste water treatment.
Identifiers: *Sludge characterization, *Phosphorus removal.

This study is a portion of a sludge dewatering and reduction project aimed at the characterization of sludges with respect to physical, chemical, and biological properties and the correlation of these properties with various process units. Some of the progress achieved in this area is presented and discussed. The methods presently used for the determination of clarifier areas are evaluated. Typical results are presented. (See also W74-08846) (Sandoski-FIRL)
W74-08859

THICKENING AND DEWATERING SLUDGES PRODUCED IN PHOSPHATE REMOVAL,
C. H. Knight, R. G. Mondoux, and B. Hambley.
In: Phosphorus Removal Design Seminar, Conference Proceedings No. 1 (1973). 17 p, 4 fig, 7 ref.

Descriptors: Treatment facilities, Efficiencies, *Dewatering, *Sludge treatment, *Chemical precipitation, Water balance, *Waste water treatment, *Canada.
Identifiers: *Phosphorus removal, *Sludge thickening, Treatment methods.

The effect of adding 80 percent phosphate removal facilities on the capacity and efficiency of dewatering processes is examined. Material and water balances and average capacity figures are developed for the various dewatering processes and different chemical additions. No two sludges are alike; bench scale and plant scale tests are desirable to confirm critical design conditions. The various treatment methods studied include gravity thickening, flotation thickening, nozzle discharge disc centrifuge thickening, vacuum filtration, and conveyor type centrifuge dewatering. (See also W74-08846) (Sandoski-FIRL)
W74-08860

A CURSORY LOOK AT THE IMPACT OF PHOSPHORUS LADEN SLUDGES ON CONVERSION PROCESSES,
R. V. Villiers.
In: Phosphorus Removal Design Seminar, Conference Proceedings No 1, (1973). 20 p, 6 tab, 14 ref.

Descriptors: *Sludge treatment, Heat treatment, *Incineration, *Anaerobic digestion, *Aerobic treatment, *Chlorination, Lime, Phosphorus, Temperature, Hydrogen ion concentration, Mixing time, Organic matter, Operations, *Canada, *Waste water treatment.
Identifiers: *Phosphorus removal, Sludge characteristics, Loading.

Conversion processes alter sludge constituents to make them inoffensive, nonviable, or unextractable to permit reuse or return of the sludge to the environment. Such processes include heat treatment, incineration, anaerobic digestion, aerobic digestion, chlorination, or lime treatment. All processes are temperature and pH dependent; sensitive to change in loading, time, and mixing; sensitive to change in air and food supply; and concerned with organic matter destruction or stabilization. Cause-effect relationships between the process and phosphorus-sludge are predicted by relating the following three categorizations to the various conversion processes. The categorizations are: changes in sludge characteristics; process operating parameters; and, changes in sludge components during conversion. (See also W74-08846) (Sandoski-FIRL)
W74-08861

LAND APPLICATION OF PROCESSED ORGANIC WASTES,
Ministry of the Environment, Toronto (Ontario). Waste Management Branch.
G. M. Wood.
In: Phosphorus Removal Design Seminar, Conference Proceedings No 1, (1973). 29 p, 2 tab.

Descriptors: *Regulation, *Governments, *Organic wastes, *Waste disposal, *Waste treatment, *Soil disposal fields, Soil engineering, Sites, *Canada.
Identifiers: *Phosphorus removal.

Under the authority of the recent amendments to Regulation 824 of the Revised Regulations of Ontario, 1970, the Ministry of the Environment is undertaking the certification of haulers, organic waste management systems, and organic soil conditioning sites for the disposal of processed organic waste. According to the amendment, 'No person shall use, operate, establish, alter, enlarge, or extend a waste management system or a waste disposal site' unless governmental approval has been received. Standards for the location, maintenance, and operation of an organic soil conditioning site which include such topics as site location, land characteristics, site management, and sludge application rates are discussed. (See also W74-08846) (Sandoski-FIRL)
W74-08862

THE BALANCE BETWEEN WASTE TREATMENT AND WASTE DISCHARGE IN THE U.S., 1957-2000,
Monash Univ., Clayton (Australia). Dept. of Mechanical Engineering.
I. G. Wallis.
Journal of the Water Pollution Control Federation, Vol 46, No 3, p 438-457, March, 1974. 3 fig, 11 tab, 54 reg.

Descriptors: *Waste water treatment, *Water quality, *Phosphorus, Agricultural wastes, Domestic wastes, Human population, Costs, Effluents, *Waste treatment, Sewage systems, Oxygen demand, *Waste disposal.

If overall river quality level is to improve, treatment efficiency must increase even faster than the rate of increase of waste generation. The treatment level required to maintain a constant level of waste discharge is estimated for years 1970 to 2000. Two ubiquitous wastes are phosphorus wastes-generated primarily from domestic and agricultural sources, and oxygen demanding wastes--produced from industrial sources. Factors for increase in phosphorus wastes were population increase, growth in detergent use, expansion of the sewage system, and increased rural runoff of phosphoric fertilizers. High costs of waste treatment include changing raw material input, production process, recovering materials from the effluent, and transforming effluents into a useful by-product. The technological advances necessary to reduce waste discharge and hence improve water quality, a feasible but costly process are discussed. (Prague-FIRL)

EVALUATION OF A ROTATING DISK WASTEWATER TREATMENT PLANT,
Autotrol Corp., Milwaukee, Wis. Bio-Systems Div.
R. L. Antonie, D. L. Kluge, and J. H. Mielke.
Journal of the Water Pollution Control Federation, Vol 46, No 3, p 498-511, March, 1974. 11 fig, 4 tab, 5 ref.

Descriptors: *Waste water treatment, *Biochemical oxygen demand, *Nitrification, *Organic loading, *Suspended solids, Hydraulics, Sludge treatment, Treatment facilities.
Identifiers: Waste water treatment plant, Hydraulic loading, Treatment plant construction, Sludge Solids.

After nine out of twelve months of an evaluation period, a 0.5 mgd (1.9-mil liter/day) rotating disk municipal waste water treatment plant has been highly successful. Capability is shown of achieving high degrees of biochemical oxygen demand and suspended solid removal and nitrification. The variables investigated included rotational disk velocity, hydraulic loading, and exposure to different climatic conditions. The plant exhibited stable operation under conditions of fluctuating hydraulic and organic loading and waste water temperature. High density of sludge solids indicates significant potential savings in treatment plant construction and operating costs. (Prague-FIRL)

WATER UTILITIES OPERATOR TRAINING: A WORTHY INVESTMENT,
Texas Water Quality Board, Austin. Central Operations Div.
H. D. Jobes.
Water and Sewage Works, Vol 121, No 4, p 58-59, April, 1974.

Descriptors: Training, *Operations, *Evaluation, Personnel, *Texas, Water quality, Investment, Water pollution control, *Treatment facilities.

A study made for the Environmental Protection Agency on a water utilities operator training program in Texas is discussed. Methodology of the study was to examine treatment plant operations as they existed before employee training and to examine results after training. The effectiveness evaluation study document states in its conclusion that for every dollar invested in training, the equivalent of an additional $91 investment in capital plant was activated in terms of improved performance. The degree of reduction of BOD, total suspended solids, and levels of overall improvements following training indicated conclusively that for these plants the value of return on training was high in terms of both dollars invested and cleanliness of water treatment. (Merritt-FIRL)
W74-08879

FLOC BLANKET CLARIFICATION.
Effluent and Water Treatment Journal, Vol 14, No 1, p 51 January, 1974.

Descriptors: *Waste water treatment, *Chemical properties, *Hydraulic properties, Water purification, Equipment, Flocculation, Iron compounds, Rivers.
Identifiers: *Floc blanket clarifiers, *Czechoslovakia.

Laboratory experiments at the Technical College at Zilina and full scale tests at Brno in Czechoslovakia have been investigating the floc blanket clarifiers in terms of hydraulic and chemical characteristics. In the laboratory a 300 mm diameter by 3 m high column received chemically dosed water entering tangentially at the base. At upflow velocities of 1.2 mm/s floc volume concentrations were uniform with depth at about 20%, but solids fraction values increased with depth, usually increasing by about 20% from top to bottom. The actual values of solids fraction depended on the chemicals which had been added. River water was utilized at Brno and when the water temperature exceeded 10 C the upflow rate was 1.3 mm/s, but during winter the output fell to about 0.8 mm/s. Previously, output had been sustained by 25 mg/liter bentonite, but it was learned that 0.3 mg/liter starch produced the required results. Performance was assessed in terms of residual iron in the clarified water. The iron could be measured against performance characteristics; the flocculation product was the most sensitive parameter with an optimal value of 3000. (Merritt-FIRL)
W74-08884

TURBIDITY CONTROL BY AUTOMATIC DIVERSION,
Treatment and Supply, Aspen, Colo.
J. J. Markalunas.
Water and Sewage Works, Vol 121, No 2, p 44-45, February, 1974.

Descriptors: *Waste water treatment, *Diversion structures, *Turbidity, *Automatic control, *Chemical treatment, Treatment facilities, Water purification, Iron compounds, Industrial wastes, *Colorado.
Identifiers: *Aspen(Colo), Turbidimeters.

The automatic raw water diversion system and automatic chemical dosage system for turbidity control at the Aspen, Colorado treatment plant are described. At times the water supply for Aspen (Castle Creek) becomes highly turbid and high in iron content. To assure that this water does not enter the city's reservoir, a system was devised to turn off the raw water diversion and restore the raw water pipeline to service after the water cleared up. An intake diversion dam on Castle Creek conducts the flow through a pipe line to a structure where a 30 in diameter butterfly valve is located. When the valve is closed, the flow passes over a weir and returns to the creek. When the valve is open, the water flows on through the pipe line to the water treatment plant some 2 miles away. This unit has an automatic alarm system that enables the operator to maintain a chemical dosage for a limited range of turbidities and also increases the length of filter runs. The raw water storage reservoir does not silt up as quickly and the net water production of the plant is greater. (Merritt-FIRL)

NEW ARIZONA WASTEWATER PLANT TO ALLEVIATE PROBLEMS,
Collins (John S.), and Associates, Tucson, Ariz.
E. Roll.
Water and Sewage Works, Vol 121, No 4, p 60, April, 1974.

Descriptors: *Reclaimed water, *Waste water treatment, *Treatment facilities, *Arizona, Equipment, Automation, Automatic control, Activated sludge, Biological treatment, Flow, Suspended solids, Biological oxygen demand, Costs, Measurement.
Identifiers: *Tucson(Ariz).

The Tuscon, Arizona $1.5 million waste water reclamation plant now under construction is described. The new, nearly constant flow (1,417 gpm) plant will have automatic sampling equipment, electronic metering and control, and will automatically record pH and chlorine residual levels. It will utilize automatic air injection and solids control for the aeration basin. The control building also has a small but efficient facility for on site laboratory analysis and an equipment maintenance shop. The activated sludge biological process will be used in handling an average flow of 1.5 mg/d and a peak of 2.0 mg/d. Influent to the reclamation system has 180 mg/liter of suspended solids and 200 mg/liter of biological oxygen demand. The cost of the operation is estimated at $84,293 per year of $154 per million gallons of reclaimed water produced. (Merritt-FIRL)

APPARATUS FOR AND PROCESS OF TREATING LIQUIDS WITH A GAS,
E. T. Armstrong.
U.S. Patent 3,805,481. Official Gazette of the U.S. Patent Office, Vol 921, No 4, p 1359, April 23, 1974. 1 fig.

Descriptors: *Gases, *Patents, *Liquids, *Mixing, Disinfection, Separation techniques, Equipment, Flow, Oxygen, Ozone, Flow, *Waste water treatment.
Identifiers: Sterilization, Bacterial reduction.

A gas-liquid mixing system for selective bacterial reduction, generalized disinfection sterilization or other gas treatment of the liquid is described. The system utilizes essential gravitational head and/or pumps in conjunction with a process flow line which may operate under a hydraulic pressure gradient. It has an inlet at one end for receiving the untreated liquid and an outlet at its opposite end, one or more local areas of high momentum exchange, and one or more injectors for the introduction of a gas into the process line. The injectors are located so as to introduce the gas into the liquid downstream from the areas of high momentum exchange where the static pressure is at least partially regained. The gas may consist of air, oxygen, or an oxygen ozone mixture, either alone or mixed with a carrier gas. (Merritt-FIRL)
W74-08896

RADIOACTIVE WASTE TREATMENT SYSTEM,
Nuclear Waste Systems Co., Campbell, Calif. (Assignee)
J. Mertens.
U.S. Patent 3,805,959. Official Gazette of the U.S. Patent Office, Vol 921, No 4, p 1483, April 23, 1974.

Descriptors: *Waste water treatment, *Patents, *Radioactive wastes, Solid wastes, Sludges, Resins, Storage tanks, Separation techniques, Percolation, Waste disposal.

A radioactive waste treatment system is described for solid radioactive process waste from nuclear reactor power plants. The wastes consist of filter sludges and demineralized resins or ion exchange resins. The wastes are moved to large tanks where they are collected. The backwash water and floor drain water wastes are percolated through settled solids by gravity. In doing so, the wastes are prefiltered and predemineralized. The waste waters are then polished in the water treatment system and returned to a condensate storage tank. (Merritt-FIRL)
W74-08897

SEWAGE AND WATER TREATMENT WITH MODIFIED QUARTERNARY SALTS OF VINYLPYRIDINE COPOLYMERS,
Philips Petroleum Co., Bartlesville, Okla. (Assignee)
R. C. Doss, and J. W. Cleary.
U.S. Patent 3,806,450. Official Gazette of the U.S. Patent Office, Vol 921, No 4, p 1604, April 23, 1974.

Descriptors: *Patents, *Sewage treatment, *Waste water treatment, *Salts, Coagulation, Filtration, Flocculation.
Identifiers: *Vinylpyridine, *Quarternary salts.

A sewage and water treatment system is described in which the sewage and water are chemically conditioned with modified quaternary salts of vinylpyridine copolymers. Coagulation, flocculation, and filtration in sewage and water treatment processes are significantly improved by the use of the salts. (Merritt-FIRL)

METHOD AND APPARATUS FOR REMOVING SOLIDS,
FMC Corp., San Jose, Calif. (assignee)
H. L. Pentz, C. Parkhani, and F. Majeron.
U.S. Patent 3,807,560. Official Gazette of the U.S. Patent Office, Vol 921, No 5, p 1908-1909, April 30, 1974. 1 fig.

Descriptors: *Separation techniques, *Patents, Equipment, *Bottom sediments, Settling basins, *Sludge treatment, *Waste water treatment.

A method and apparatus for removing a varying depth layer of settled solids from the bottom of a sedimentation tank is described. The apparatus includes a plurality of spaced eduction means supported on a bridge that is movable transversely between spaced inlets and outlets for the tank to remove settled solids from associated zones in the tank bottom. The apparatus provides a range of flow capacity between a minimum and maximum for each zone. The flow of sludge can be adjusted to remove all deposited solids from each zone during each pass of the bridge. A sensing mechanism maintains a substantially uniform solids concentration in the sludge being removed. (Merritt-FIRL)
W74-08902

FORT WORTH WATER SUPPLY AND TREATMENT PLANT DEDICATED.
Water and Sewage Works, Vol 12, No 4, p 46-47, 63, April, 1974. 5 fig.

Descriptors: *Design data, *Pumping station, *Treatment facilities, Pipelines, Reservoirs, Construction, *Waste water treatment, Chemical treatment, Water analysis, Taste, Odor, Sedimentation, Filtration, Filters, Pumps, Flocculation, *Texas.
Identifiers: *Fort Worth(Tex).

The dedication and design of the Cedar Creek Lake Pump Station and the Rolling Hill Water Treatment Plant of Fort Worth, Texas are described. The Cedar Creek project consists of the Cedar Creek Reservoir with a capacity of 678,000 acre-ft, the dam being about 85 mi southeast of Fort Worth; an intake pump station at the reservoir; a 72 in pipe line with appurtenant pump stations, 68.2 mi in length from the reservoir intake to a balancing reservoir at the end of the 72 in section of pipe line; an 84 in pipe line, 6.1 mi in length from the balancing reservoir to the site of the treatment plant; and the balancing reservoir with a capacity of 150 mil gal. Designed to handle 80 mgd, the $8.7 million Rolling Hills plant will be able to treat 100 mgd when transmission facilities permit. Expansion to 160 mgd will not require added chemical facilities, administrative or laboratory buildings, or high service pump stations. The 194 acre sites will allow expansion to 320 mgd. Plant design permits ultimate computer control with data logging. The water is treated for turbidity, taste, and odor control. Following chemical application proportional to flow, the water is mixed, coagulated, settled, filtered and stored for delivery. (Merritt-FIRL)

METHOD FOR DRYING SLUDGE AND INCINERATING ODOR BODIES,
Atomic Energy Commission, Washington, D.C. (assignee)
F. R. Keller.
U.S. Patent 3,805,715. Official Gazette of the U.S. Patent Office, Vol 921, No 4, p 1421, April 23, 1974.

Descriptors: *Drying, *Patents, *Sewage sludge, *Odor, Control, *Incineration, Gases, Turbines, Equipment, Waste water treatment.
Identifiers: *Fluidized bed.

A process for drying sewage sludge and eliminating its odors is described. The sludge is dried in a fluidized bed dryer while the odors are eliminated by incinerating them in a fluidized bed incinerator. The hot exit gases from the incinerator are employed to preheat both the sewage sludge feed and the fluidizing air stream for the fluidized bed dryer. The dryer contains a heat exchanger submerged in the fluidized bed which provides the heat for drying from the low pressure exhaust steam exiting from an extraction turbine. The condensate and exhaust from the dryer heat exchanger are recycled to the incinerator heat exchanger for generation of high pressure steam. The output of the extraction turbine is used to drive air blowers for the two fluidized beds. The fluidized bed incinerator is fluidized with the stream of off gases and odor bodies from the fluidized bed dryer, the fuel value of the off gases and odor is effectively used in the incinerator where heat is generated by fuel combustion. (Merritt-FIRL)

SEWAGE FLOW CONTROL SYSTEM,
S. F. Smith.
U.S. Patent 3,805,817. Official Gazette of the U.S. Patent Office, Vol 921, No 4, p 1446-1447, April 23, 1974. 2 fig.

Descriptors: *Patents, *Sewage, *Flow control, Pipes, Stabilization, Flow rates, Groundwater, Waste water treatment, Pollution abatement, *Water pollution control.

A sewage flosw control system is described for a sewage piping complex. Flow stabilizing stations are mounted in a series of section, each including means for constricting and means for accelerating flow to maintain selected pressures and flow rates in the controlled sections. This process obtains maximum use of the cubical volume of the piping complex to maintain the piping full of fluid to provide overall even flows of sewage during both normal peak and low volume flows and sufficient internal piping pressure to inhibit ground water influx. (Merritt-FIRL)

RELATIONSHIP BETWEEN BOD REMOVAL AND LAS DETERGENT REMOVAL IN WASTEWATER TREATMENT SYSTEMS,
Puerto Rico Univ., Mayaquez. Dept. of Civil Engineering.
N.-H. Tang.
Available from the National Technical Information Service as PB-232 997; $3.75 in paper copy, $1.45 in microfiche. Puerto Rico Water Resources Research Institute, Mayaquez, Completion Report, May 1974. 57 p, 16 fig, 15 tab, 6 ref. OWRR A-035-PR(1).

Descriptors: *Waste water treatment, *Biochemical oxygen demand, *Detergents, *Linear alkylate sulfonates, Domestic wastes, *Biological treatment, Performance efficiencies, Activated sludge, Trickling filters, Chemical oxygen demand.
Identifiers: *BOD removal, Total organic carbon.

Traditionally, biological process efficiency is measured by its BOD removal. However, a period of 5 days is required to determine the BOD in wastewater. This is too long a period of time for process control. If the process is controlled by COD removal, much shorter time will be needed for determination. The complexity of today's sewage causes the ratio of biodegradable organics to nonbiodegradable organics in wastewater to change frequently; this changing nature, in turn, prevents meaningful uses of COD information. Information of TOC has the same problem as that of COD. In detergent., LAS (Linear Alkylate Sulfonate) is a basic organic element which is readily degraded in municipal biological processes. It is one of the many biodegradable organic compounds in wastewater. The fact that LAS can be rapidly determined within 30 minutes makes its use advantageous for process control. The relationship between BOD removal and LAS removal in biological processes, was studied. The results indicate that BOD removal and LAS removal in both activated sludge and trickling filter processes are significantly correlated. It is very likely that the % LAS removal of a biological process can be used to predict the % BOD removal of the same process.
W74-08939

EVALUATING WATER REUSE ALTERNATIVES IN WATER RESOURCES PLANNING,
Utah State Univ., Logan. Center for Water Resources Research.
A. B. Bishop, W. J. Grenney, R. Narayanan, and S. L. Klemetson.
Available from the National Technical Information Service as PB-232 996; $4.75 in paper copy, $1.45 in microfiche. Utah Water Research Laboratory, Publication No PRWG123-1, January 1974. 137 p, 42 fig, 28 tab, 39 ref, 8 append. OWRR B-075-UTAH(1). 14-31-0001-3941.

Descriptors: *Water reuse, *Waste water treatment, *Water supply, *Systems analysis, Linear programming, Optimization, Water costs, *Utah, Evaluation, *Alternative planning, Model studies.
Identifiers: Jordan River Basin(Utah), Salt Lake City(Utah).

Water reuse is a recognized option for augmenting water supplies to provide for expanded water needs. A methodology is developed for examining optimal strategies for water reuse within the context of the total water resources system, including both the provision of water supplies for various uses and management of wastewaters. A model of the water resources system is formulated as a 'transportation' or 'transshipment' problem in linear programming depicting the possible sources of supply, including effluent sources available for reuse, which can be used to satisfy the requirements of various water users. The optimizing objective in the model is to minimize the cost of meeting water supply requirements and of wastewater treatment to satisfy water quality standards. The Lower Jordan River Basin, which encompasses the Salt Lake City, Utah, metropolitan area, is used as a case study for applying and testing the model. Optimal allocations were obtained for low, middle, and high forecasts of future water requirements roughly corresponding to a fifty-year time horizon. Four alternatives for regional wastewater treatment were also analyzed considering possibilities for reuse. Assessment capabilities of the model include examining redistribution of supplies, time-staging of supplies and related treatment facilities, and analyzing sensitivity of allocations to changes in costs.

INDUSTRIAL WATER SOFTENER WASTE BRINE RECLAMATION,
Culligan, International Co., Northbrook, Ill.
J. Burton, and E. Kreusch.
Copy Available from GPO Sup Doc as EP1.23:660/2-74-007, $1.95; microfiche from NTIS as PB-233 132, $1.45. Environmental Protection Agency, Technology Series Report EPA-660/2-74-007, February 1974. 158 p, 25 fig, 19 tab, 2 ref. EPA Project 12120 GLE.

Descriptors: *Water reuse, *Water softening, *Chemical precipitation, *Brines, Hardness(Water), Water pollution treatment lime, *Waste disposal, Brine disposal, Industrial water, Capital costs, Operating costs.
Identifiers: *Regenerant reuse, Lime soda softening, Regenerant disposal.

There are two alternatives for discharge of water softener regenerant brines to receiving streams: (1) truck to approved dumping site; (2) reclaim for reuse. Brine reuse has been studied at a central regeneration facility for portable water softeners. Reclamation used modified lime-soda softening for the waste brine to produce an acceptable regenerant brine. Regenerant wastes were reduced by 89% to produce an environmentally acceptable sludge. The process is feasible technically, marginal economically. The added costs for lime and soda ash are less than is the value of salt and water reclaimed by their use. That is, the process is cheaper chemically; however, equipment and labor costs negate this savings. Depreciation and operating costs were high at the test location: total costs favor trucking wastes to an approved dumping site. Capital and operating costs may be reduced under a new project following the report's recommendations. (EPA)
W74-08941

A PLANNED MAINTENANCE MANAGEMENT SYSTEM FOR MUNICIPAL WASTEWATER TREATMENT PLANTS,
EnviroPlan, Inc., College Park, Md. Fairfax County, Va.
D. H. Sargent, and D. A. Rudich.
Copy Available from GPO Sup Doc as EP1.23:600/2-73-004, $1.55; microfiche from NTIS as PB-233 111, $1.45. Environmental Protection Agency, Technology Series Report EPA-600/2-73-004, November 1973. 111 p, 31 fig, 16 tab, 20 ref. EPA Project 11010 GWI.

Descriptors: *Waste water treatment, Maintenance, *Management, *Scheduling, *Manpower, *Operation and maintenance, *Maintenance costs, Equipment, Mechanical equipment, Hydraulic equipment, Electrical equipment, Instrumentation, Warning systems, Control systems, *Treatment facilities.
Identifiers: Planned maintenance, Maintenance management, Preventive maintenance, Corrective maintenance, Maintenance procedures.

A Planned Maintenance Management System (PMMS) has been developed and successfully demonstrated at the 18-MGD Lower Potomac Plant of Fairfax County, Va., establishing a model maintenance management program for wastewater treatment plants throughout the United States. This PMMS provides for the specific maintenance needs of each item of plant equipment and reduces the maintenance of complex equipment to simple procedures. For each procedure the PMMS details the methods, materials, tools and personnel required; schedules the task; and provides for data recording and feedback. The success of this PMMS during the 12-month demonstration phase was measured by a steady downward trend in the malfunction of mechanical equipment. Incipient failures were detected in many cases and cor-

rective action was taken to avoid breakdowns. This report describes the PMMS in technical detail; discusses the installation of the PMMS, including acceptance by the mechanics and coordination with plant operations; and outlines the application of the PMMS to other wastewater systems. (EPA)

SULFURIC ACID AND FERROUS SULFATE RECOVERY FROM WASTE PICKLE LIQUOR,
Fitzsimons Steel Co., Youngstown, Ohio.
J. K. Seyler, W. E. Thornton, and M. K. Householder.
Copy Available from GPO Sup Doc as EP1.23:660/2-73-032, $1.20; microfiche from NTIS as PB-233 112, $1.45. Environmental Protection Agency, Technology Series Report, EPA-660/2-73-032, January 1974. 71 p, 16 fig, 22 tab, 8 ref. EPA Project 12010 FNM.

Descriptors: *Waste water treatment, *Industrial wastes, Sulfates, *Crystallization, Centrifugation, Chemical precipitation, Capital costs, Operating costs.
Identifiers: Sulfuric acid, *Spent pickle liquor, Ferrous sulfate heptahydrate, *Acid recovery, Chemical recovery.

This report describes the investigation of the process variables of a facility for the treatment of spent sulfuric acid pickle liquor. The process is based on the vacuum crystalization technique developed by Keram Chemie-Lurgi of Germany. It recovers ferrous sulfate heptahydrate as a nearly dry solid by-product and recovers the unreacted acid for recycle to the pickling tank thus eliminating the discharge of spent pickle liquor and rinse water. The full scale facility achieved acid recoveries equivalent to 21.2 tons/day of 12% sulfuric acid for recycle and an average of 115 lbs/hour of 99.56% FeSO4.7H2O by-product. Capital costs were $191,710 or $19,739/year based on a fifteen year life at 6% interest. Net operating costs were $42,320/year including a $21,400/year benefit from acid recovery. (No credit of $2,300/year of ferrous sulfate heptahydrate was included due to the nationwide excess production over market absorbing ability.) The total costs were $62,059/year, $1.75/ton of steel pickled, 0.614 cents/$ total sales, or $12.93/cubic meter of wastes treated. (EPA)

TRANSURANIC SOLID WASTE MANAGEMENT RESEARCH PROGRAMS -- QUARTERLY REPORT, JULY-SEPTEMBER 1973.
Los Alamos Scientific Lab., N. Mex.
Available NTIS, Sprifield, Va, as Rept No LA-5512-PR, $4.00/copy, $1.45/microfiche. Report LA-5512-PR, February 1974. 22 p, 4 fig, 4 tab, 1 append.

Descriptors: *Radioactive waste disposal, *Underground waste disposal, *Waste treatment, *Water pollution, *Water pollution sources, Soil contamination, Research and development, Research facilities, Waste storage, Safety, Assessment, Model studies, Geology, Hydrology, Meteorology, Groundwater, Sites.
Identifiers: *Burial grounds.

Progress during the period of July-September 1973 is reviewed for three transuranic solid waste management research programs funded by the AEC Division of Waste Management and Transportation. The three programs include transuranic solid waste management research and development, the contaminated waste treatment development facility, and the burial grounds evaluation. The interim storage criteria are now ready to be issued for general review. Experiments in radiolysis and container corrosion have been reorganized and expanded to provide information for optimization of interim storage, while waste sorting experiments have begun to determine more accurately the character of wastes being produced at LASL. Several task forces have been organized for the waste treatment facility to evaluate incinerators and determine a satisfactory operational size for the facility. Work has begun on developing a model for the risk analysis of radioactive burial grounds. A questionnaire has been developed to obtain the nessary information for the analysis. (Houser-ORNL)
W74-08963

QUARTERLY PROGRESS REPORT -- RESEARCH AND DEVELOPMENT ACTIVITIES WASTE FIXATION PROGRAM -- OCTOBER THROUGH DECEMBER 1973.
Battelle-Pacific Northwest Lab., Richland, Wash. Nuclear Waste Technology Dept.
Available from NTIS, Springfield, Va, as Rept No BNWL-1809, $5.45 per copy, $1.45 microfiche. Report No BNWL-1809, January 1974. 90 p, A.M. Platt, Compiler, 29 fig, 12 tab.

Descriptors: *Radioactive waste disposal, *Waste treatment, *Wastte storage, *Research and development, Waste water(Pollution), Water pollution sources, Leaching, Ion transport, Transporation.
Identifiers: *Waste solidification, *Spray solidification, *Fluidized bed process, Vitrification, Calcination, Fixation, Vaporization.

Progress is reported in research and development activities in the field of radioactive waste fixation. In the area of development of spray calciner and inconel melter, the major considerations were melt agitation, filter differential pressure, and quench scrubbing of the off-gas. Operating parameters and results of development of spray solidification runs are given. Ceramic refractories are being tested in a high temperature waste glass to determine their compatibility for use in a ceramic-lined waste glass melter. Cost comparisons are made for improved heat transfer in radioactive waste canisters. Three oxide systems were examined to note effects of composition on leachability. Waste vaporization studies are made to investigate the behavior of fission product containing wastes. Attention is being given to helium incorporated in the pores of high level waste glasses which may possibly cause stresses similar to those of a small pressure vessel. Analysis of gas samples inside the canisters after storage showed helium and hydrogen below detectable limits. Some alternative waste fixation schemes are being studied. (Houser-ORNL)
W74-08965

THE ENDOTHERMIC PROCESS--APPLICATION TO IMMOBILIZATION OF HANFORD IN-TANK SOLIDIFIED WASTE,
Atlantic Richfield Hanford Co., Richland, Wash. Chemical Processing Div.
M. J. Kupfer, and W. W. Schulz.
Available from NTIS, Springfield, Va, as Rept No ARH-2800, $4.00/copy, $1.45/microfiche. Report No ARH-2800, July 1973. 31 p, 3 fig, 7 tab, 14 ref.

Descriptors: *Radioactive waste disposal, *Waste storage, *Waste treatment, *Leaching, *Soil water, Soil contamination, Penetration, Permeability, Porosity, Movement, Cesium, Strontium, Heat, Absorption, *Washington.
Identifiers: Vitrification, Waste burial, Endothermic, Richland(Wash).

Converson of high-level solid radioactive waste to a nonleachable silicate glass is accomplished in the Endothermic process by simple melting of a mixture of the waste with crushed basalt. Dense (2.5 g cm(-3)) green-black glasses are obtained by melting mixtures containing 30 to 40 wt% Hanford In-Tank Solidified (ITS) waste, 50 to 70 wt% basalt, and 0 to 10 wt% B2O3. Addition of B203 to the process charge is desirable to lower its melting range from about 1100-1150C to 1000-1050C. Leach rates of these glasses (calculated from the sum of the concentrations of Fe, Na, Ca, Si, Mg, Al, Sr, and Cs in the leach liquor) in water at 25C range from 10(-7) to 10(-5) g/cm sq day. The leach rate, based on Cs-137, of a typical Endothermic process glass made from actual ITS waste is 3.0 x 10(-8) g/cm sq day. This leach rate corresponds to removal of 2.1 x 10(-14) g Cs-137 per day from a square centimeter of glass containing 57 micro-Ci Cs-137 per gram. Judging from initial tests, the Endothermic process is a very promising scheme to increase immobilization of the ITS waste. (Houser-ORNL)
W74-08968

ORGANIC AND COLOR REMOVAL FROM WATER SUPPLIES BY SYNTHETIC RESINOUS ADSORBENTS,
Alaska Univ., College. Environmental Quality Engineering and Civil Engineering.
T. Tilsworth.
Available from the National Technical Information Service as PB-233 068, $3.75 in paper copy, $1.45 in microfiche. Alaska Institute of Water Resources, Fairbanks, Report No IWR-50, January 1974. 53 p, 16 fig, 2 tab, 29 ref. OWRR A-034-ALAS(1).

Descriptors: *Resins, Ion exchange, *Adsorption, Absorption, *Color, Activated carbon, Aesthetics, Filtration, *Waste water treatment, *Water treatment, Alaska, Water supply, *Organic matter.
Identifiers: Synthetic resinous adsorbents.

An experimental study was conducted to evaluate the effectiveness of synthetic resinous adsorbents for removing color and organics from water supplies. Four different resins were tested with water from three individual sources. The results show that synthetic resinous adsorbents were effective in removing color and organics. The effectiveness of the resins was dependent on their individual characteristics. In general, the resins performed best for moderate concentrations of color and organics. Relatively good color removal was achieved on the sewage treatment plant effluent. Some difficulty was encountered in treating the waters so that they would meet the color requirements for U.S.P.H.S. drinking water standards. The use of synthetic resinous adsorbents appears to hold promise for treatment of relatively small water supplies containing color and organics. The economics of such systems needs further evaluation.
W74-09050

APPLICATION OF REVERSE OSMOSIS TECHNOLOGY TO HAWAIIAN LOW QUALITY WATERS,
Hawaii Univ., Honolulu. Water Resources Research Center.
B.-J. Chang, R. H. F. Young, and J. C. S. Chou.
Available from the National Technical Information Service as PB-233 130, $3.75 in paper copy, $1.45 in microfiche. Technical Report No 73, November 1973. 54 p, 17 fig, 17 tab, 29 ref. OWRR A-036-HI(1). 14-31-0001-3811.

Descriptors: *Hawaii, *Waste water treatment, Treatment facilities, *Reverse osmosis, Groundwater, Water quality, *Pilot plants, *Desalination, Brackish water.
Identifiers: *Oahu(H.I.).

A study of the application of reverse osmosis technology to the treatment of Hawaiian low quality waters was conducted. The purpose was to investigate the technical and economical feasibility of utilizing reverse osmosis technology to renovate waste waters after varying degrees of

conventional treatment, and to desalt Hawaiian brackish groundwater from both basaltic and reef limestone aquifers. The experimental investigation of the technical feasibility of renovating waste water and desalting brackish groundwater was conducted with a small reverse osmosis pilot unit at four test sites on the island of Oahu. The operation of the reverse osmosis pilot unit in processing waste waters suffered from the problem of performance decline. However, the pilot unit's operation with brackish groundwater yielded promising results. In general, high rejections of total dissolved solids, refractory organics, nutrients, bacteria, and virus were accomplished by the unit. Two waste water reclamation schemes incorporating the reverse osmosis process were considered possible in Hawaii. Treatment expenditures of the two schemes were estimated at 97.8 cents and 103.2 cents per 1000 gallons of treated waste water. Based on a cost model developed for estimating desalting costs by reverse osmosis plants with spiral wound modules, product water costs in Hawaii were estimated at 83.7 cents, 63.4 cents, and 49.7 cents per 1000 gallons for 1, 10, and 50 mgd plants, respectively.
W74-09052

A PORTABLE DEVICE FOR MEASURING WASTEWATER FLOW IN SEWERS,
Hittman Associates, Inc., Columbia, Md.
M. A. Nawrocki.
Copy Available from GPO Sup Doc as EP1.23:600/2-73-002, $1.00; microfiche from NTIS as PB-233 142 $1.45. Environmental Protection Agency, Technology Series Report, EPA-600/2-73-002, January 1974. 53p, 19 fig, 5 tab, 8 ref. EPA Project 11024 EVF Contract 14-12-909.

Descriptors: *Flow Measurement, *Sewers, Development, Gages, *Fabricati Instrumentation, *Design criteria, Measurement, Pipes, *Waste water(Pollution).
Identifiers: *Capacitance, *Heat pulse velocity, Prototype Development.

A research and development program to develop a portable device which is capable of measuring wastewater flow in sewers was undertaken. This work consisted of an investigation of the theoretical approach to be used, laboratory investigations and experiments to develop design criteria, design and fabrication of two prototype units, and field testing and evaluation of these units. Measurement of the cross-sectional area of flow was done by the use of capacitor plates to sense the change in water level in the sewer pipe. The method selected to measure the velocity of the flow involved the timing of a heat pulse as it traveled down the pipe. Theoretical evaluations and laboratory experiments were performed to prove the mode of operation of the proposed gage. Two protype gages were fabricated. The overall accuracy of the final prototype was plus or minus 15 percent. The accuracy of the separate cross-sectional area measurements was within five percent. Cross-sectional area measurements were not affected by contaminants in the sewer. Scum deposits on the walls of the gage significantly and adversely affected the accuracy of the velocity readings. METALLIC RECOVERY FROM WASTE WATERS UTILIZING CEMENTATION,
American Brass Co., Westbury, Conn. Div. of Engineered Environments.
O. P. Case.
Copy Available from GPO Sup Doc as EP1.23:670/2-74-008, $0.85, microfiche from NTIS as PB-233 143 $1.45. Environmental Protection Agency, Technology Series Report, EPA-670/2-74-008, January 1974. 36 p, 10 fig, 5 tab, 12 ref. EPA Program Element 1BB-36 Grant No S-802254.

Descriptors: Pollution abatement, Chemical wastes, *Industrial wastes, Recycling, *Waste water treatment, Electrochemistry, Waste treatment, Copper.
Identifiers: Copper recovery, Hexavalent chromium reduction, *Electrochemical reduction, Electrochemical replacement, *Cementation(Electrochemical), Iron reductant, Particulate iron, Alkali earth metal-silicon alloys, *Metal finishing wastes, *Metal recovery.

Bench-scale experiments utilizing the 'cementation' reaction (ie electrochemical reduction by contact with a metal of higher oxidation potential) for the precipitation of copper and the reduction of hexavalent chromium in industrial waste streams were performed. Reductants included: soft iron shot 4.37 mm dia, particulate iron approximately -400 mesh and alkali earth metal-silicon alloys in granular form. Soft iron shot was found to be an effective reductant. Below pH 3.0 chromium reduction is rapid and quantitative. Copper cementation is slower and is influenced more strongly by oxygen, speed of mixing, and available iron surface. Previously deposited copper does not significantly impede further copper deposition. Copper catalyzes the chromium reduction. Particulate iron was not as satisfactory as the iron shot due to 'clumping' of the particles when they became coated with copper. Silicon alloys were effective for removal of copper, zinc and trivalent chromium, but not reliable for hexavalent chromium since the reaction is not primarily a reducing one. (EPA)
W74-09062

CHEMICAL/PHYSICAL AND BIOLOGICAL TREATMENT OF WOOL PROCESSING WASTES,
Metcalf and Eddy, Inc., Boston Mass.
L. T. Hatch, R. E. Sharpin, and W. T. Wirtanen.
Copy Available from GPO Sup Doc as EP1.23:660/2-73-036, $1.05; microfiche from NTIS as PB-233 137 $1.45. Environmental Protection Agency, Technology Series Report EPA-660/2-73-036, January 1974. 57 p, 18 fig, 22 tab, 20 ref. EPA Project 12130 HFX.

Descriptors: *Waste water treatment, Water quality control, Pollution abatement, Treatment facilities, *Industrial wastes, Pilot plants, Physicochemical properties, Activated sludge, *Biochemical oxygen demand, *Chemical oxygen demand, *Suspended solids.
Identifiers: *Wool scouring waste water, Chemically/Physically treated grease removal, Biological organic romoval, Temperature effects, *Acid-cracking treatment.

Elevated temperature acid cracking combined with pilot activated sludge and lagoon treatment were utilized to treat effluent wastewater from a woolen processing plant. Effluent from woolen 'top' (raw wool scouring) making is very high in biochemical oxygen demand (BOD), chemical oxygen demand (COD), and suspended solids (SS) (18,880 ppm, 60,600/ppm, and 37,600 ppm, respectively). The chemical/physical system consisted of a hot acid-cracking process to reduce the grease content in the influent to the biological system. Average grease reductions were from 13,400 milligrams per liter (mg/L) to 120 mg/L or 99 percent with a BOD reduction of 70 percent and COD reduction of 80 percent. The biological system consisted of a pilot extended aeration activated sludge unit with clarification and retention in a pilot facultative lagoon (53 days' retention). Typical BOD and COD reductions in the activated sludge/clarification unit were 83 percent and 54 percent, respectively, and in the lagoon 56 percent and 54 percent, respectively. (EPA)

TREATMENT OF SULFITE EVAPORATOR CENDENSATES FOR RECOVERY OF VOLATILE COMPONENTS,
Institute of Paper Chemistry, Appleton, Wis. Div. of Industrial and Environmental Systems.
K. W. Baierl, N. L. Chang, B. F. Lueck, A. J. Wiley, and R. A. Holm.
Copy Available from GPO Sup Doc as EP1.23:660/2-73-030, $2.10; microfiche from NTIS as PB-233 139 $1.45. Environmental Protection Agency, Technology Series Report EPA-660/2-73-030, December 1973. 168 p, 52 fig, 28 tab. EPA Program Element 1B2037 Grant S801207.

Descriptors: *Waste water treatment, *Evaporators, *Condensation, Activated carbon, Adsorption, Lignins, Solvent extractions, Separation techniques, *Distillation, Alcohols, Acids, Organic acids, Pulp wastes, *Pulp and paper industry, Biochemical oxygen demand, Chemical oxygen demand, Water pollution, Industrial wastes, Heat balance, Mass transfer, *Sulfite liquors.
Identifiers: Steam stripping, Fractional distillation, Spent sulfite liquor, Acetic acid, Methanol, Furfural, Ethyl acetate, Volatile acids, Neutral volatiles, Nonvolatile organics, Lignin, Lignosulfonic acids.

Pilot studies were conducted on two routes for recovery of volatile components in condensates from evaporation of spent liquors from acid sulfite pulping. The condensates were steam stripped prior to adsorption on activated carbon. The first route utilized fractional distillation and solvent extraction from the carbon, while the second route used low-temperature thermal regeneration. Relatively pure SO2, methanol, furfural, and ethyl acetate were recovered. Estimated process economy, based upon recovery of saleable volatiles, favorable mass and heat balances, and credits for BOD removal, indicates the first route may provide a favorable method for the removal of pollutants from condensates. Low temperature regeneration studies failed due to mechanical design problems, but this second route continues to be considered as technically feasible. In an important auxiliary study, a substantial number of condensate samples from cooperating mills were analyzed. Differences in quality, quantity, and dilution of the condensates from different sources were apparent. Individual design of processing facilities for each mill is indicated, and especially so in those mills where backwashing of the evaporators contaminate the condensate with nonvolatile materials. INVENTORY OF WASTE WATER PRODUCTION AND WASTE WATER RECLAMATION PRACTICES IN CALIFORNIA, 1970-1971,
California State Dept. of Water Resources, Sacramento.
C. F. Kleine, and W. B. Mitchell.
Bulletin No 68-71, November 1972. 35 p, 1 fig, 6 tab.

Descriptors: *Water reuse, *Reclaimed water, *California, Water supply, Census, Water sources, Sewage effluents, Waste water disposal, Irrigation, Tertiary treatment, Waste water treatment.

A summary of the status of municipal, industrial, and domestic waste water production and reclamation in California by local governmental units, federal institutions, and private enterprises is compiled for the years 1971-1972. About 175,000 acre-feet of water was reclaimed and reused out of a potential 2.3 million acre-feet of waste water according to 766 dischargers in 1970 compared to 190,000 acre-feet out of 2.5 million reported by 805 dischargers in 1971. Some 339,000 acre-feet in 1970 and 409,000 acre-feet in 1971 of treated municipal and industrial wastes were discharged into streams, lakes, reservoirs, and groundwater basins, thereby providing a readily available

urce of reusable water. Sewage systems produc- g less than 10 acre-feet annually and home mestic systems were not evaluated. The study, oken down into hydrologic units, shows the uthern Coastal and Tulare Basins as the largest claimers. While the Tulare Basin reclaimed 75% its waste water, the Southern Coastal Basin claimed 5%, comparable to other coastal areas. land, the majority of the waste water is either claimed or returned to freshwater sources for fu- re use. Over half of the waste water produced by e state, however, is lost through discharges into line waters. (Schroeder-Wisconsin)

ASTE TREATMENT: UPGRADING OULTRY-PROCESSING FACILITIES TO EDUCE POLLUTION,
ffels Associates, Inc., Detroit, Mich.
nvironmental Protection Agency Technology ansfer Seminar Publication 3, July 1973. 48 p, 24 , 5 tab.

escriptors: *Waste water treatment, *Poultry, lanning, Industrial wastes, Florida, Treatment cilities, Design, Operation and maintenance, tes, Effluents, Lagoons.
entifiers: *Poultry processing wastes, Case his- ry, Gold Kist(Fla.).

ne quantity of waste water from poultry ocessing ranges from 5-10 gallon/bird and is typ- ally higher than domestic sewage in BOD. The itial planning requirements to implement waste- ater treatment in a poultry processing plant are scussed. Planning begins by identifying effluent urces and by examining local waste discharge andards. Secondary treatment processes evalu- ed include activated sludge, standard and high- te trickling filters, and aerobic and anaerobic goons. With the exception of anaerobic lagoons, ch of the above methods will achieve a 70-90% duction in BOD and 80-95% removal of spended solids. The major cost advantages for activated sludge and trickling-filter process are nstruction and land costs, while land utilization sts represent the major expense for lagoons. agoons represent the most prevalent poultry astes treatment process. The operating ocedures for treatment plants, providing daily, eekly, monthly, and yearly checklists are listed. case history of the Gold Kist Poultry Processing ant in Florida is analyzed. The plant was iginally designed for 50,000 birds/day per shift d has currently been expanded to 130,000 rds/day. Capital costs and operating cost per bird r the 1967 treatment plant was 0.1 and 0.06 nts/dressed pound. (Schroeder-Wisconsin)

ESIGN AND OPERATION OF LAND TREAT- ENT SYSTEMS FOR MINIMUM CON- AMINATION OF GROUND WATER,
gricultural Research Service, Phoenix, Ariz. ater Conservation Lab.
. Bouwer.
round Water, Vol 12, No 3, p 140-147, May-June 74. 5 fig, 16 ref.

escriptors: *Waste water disposal, *Artificial charge, *Irrigation, *Water spreading, Ground- ater, Water reuse, Water conservation.
entifiers: *Land disposal(Wastes).

ow-rate or irrigation-type systems for land appli- tion of sewage effluent or similar waste water e often used in humid areas because they have a nall impact on the underlying groundwater. In id areas, low-rate systems cannot be used to oduce renovated water for groundwater charge, because the renovated water will have a uch higher salt content than the effluent. enovated water of relatively low salt content can nly be produced with high-rate systems. Such stems, which require permeable soil, can also be ed in humid areas to reduce the land require- ments. To minimize the impact of high-rate systems on groundwater quality, the system should be managed to remove as much of the pollutants (particularly nitrogen and phosphorus) as possible from the waste water as it seeps through the soil, and to restrict the spread of renovated waste water in the groundwater basin. Nitrogen removal can be maximized by stimulating dentrification in the soil. Certain soils can store large quantities of phosphate. The spread of renovated water in the groundwater can be controlled by intercepting the flow of renovated water with wells or drains for reuse or discharge into surface water. Techniques for predicting the underground flow system are presented. (Knapp-USGS)

PROTRACTED RECHARGE OF TREATED SEWAGE INTO SAND: PART I--QUALITY CHANGES IN VERTICAL TRANSPORT THROUGH THE SAND,
Rensselaer Polytechnic Inst. Troy, N.Y. Dept. of Environmental Engineering.
D. B. Aulenbach, T. P. Glavin, and J. A. Romero Rojas.
Ground Water, Vol 12, No 3, p 161-169, May-June 1974. 10 fig, 1 tab, 16 ref.

Descriptors: *Artificial recharge, *Waste water disposal, Water spreading, Lakes, Water pollution control, Water quality control, Filtration, Tertiary treatment, *Water reuse, New York.
Identifiers: *Lake George(N.Y.).

When the Lake George, New York, sewage treatment plant was put into operation in 1939, it was described as a complete treatment plant because the treated effluent is discharged onto sand seepage beds which are at least 25 feet deep. When beds were dosed, they were not saturated with water below 15 feet. Ten feet of sand removes coliforms by 99% and BOD by 96%. However, nitrates, phosphates, and chlorides remain in significant concentrations after filtration through 10 feet of sand. Phosphate removal in an infrequently used sand bed is greater than in a continuously used bed. (Knapp-USGS)

CONTROLLING POLLUTION,
Grove City Coll., Pa. Dept. of Economics.
H. F. Sennholz.
The Freeman, Vol 23, No 2, p 67-77, February 1973.

Descriptors: *Economic impact, *Industrial production, *Waste disposal, *Waste treatment, *Water pollution sources, Treatment facilities, Federal government, Planning, Long-term planning, Industrial wastes, Industrial water, Municipal wastes, Costs, Prices, Social impact, Water quality, Environment, Economics, Administration, Development, Management, Government finance, Natural resources, Sewage treatment, Sewage disposal, Waste water, Cost allocation, Pollutants.

Pollution is an example of failure of the private enterprise system. Private property and the profit motive are responsible for the ever-increasing quantities of wastes and effluents, and the by-products of production and consumption such as gases, solid or liquid wastes, heat and noise pollution and industrial effluents which overload the environment and are injurious to human, animal and plant life. Large blocs of 'externalities'--social costs not included in private costs, are destroying the physical environment according to economists. Almost 3 billion tons of residue are going back into the environment annually. Ad hoc taxes and government restrictions are not enough to cope with the growing problem. Central, or at least regional control is needed, as well as a new economics that considers waste disposal an integral part of the production and consumption process. The blame ultimately, is not laid on private businessmen, but on government itself rendering economic services in a primitive manner. According to a 1968 study by the Bureau of Solid Waste Management, only 64% of the nation's people lived in communities with refuse collection systems. (Silber-Florida)

PROCESS FOR REMOVING OIL AND OTHER ORGANIC CONTAMINANTS FROM WATER,
Col-Mont Corp., Butte, Mont. (Assignee)
C. O. Bunn.
U. S. Patent No 3,798,158, 7 p, 3 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 920, No 3, p 871, March 19, 1974.

Descriptors: *Patents, *Oil pollution, *Organic wastes, *Waste water treatment, *Pollution abatement, *Oily water, Effluents, Activated carbon, Fly ash, Plastics, Specific gravity, Sewage treatment.
Identifiers: *Pollution prevention, Carbonaceous materials, Oil refineries, Activated charcoal, Polyethylene, Polypropylene.

A process and equipment are designed to treat the effluent from sewage treatment plants or oil refinery waste treatment facilities. Finely divided carbonaceous material is mixed with the effluent to be purified to form a slurry. The carbonaceous material may consist of finely divided coal, fly ash, powdered carbon, activated carbon or activated charcoal. The slurry is then influenced by specific gravity to stratify with the oil or organic material floating at the surface. The oil-enriched carbonaceous material is then mixed with a powdered plastic material. This mixture is then heated high enough to vaporize and thus strip the sorbed oil from the slurry. At such temperatures the plastic material is softened and adhesively binds the carbonaceous material forming a porous lightweight matrix material which is capable of floating on water. All or a portion of the mixture may be removed with a portion being available for recycling. (Sinha-OEIS)
W74-09175

METHOD FOR INSTALLING AERATION SYSTEMS IN SEWAGE TREATMENT TANKS,
Water Pollution Control Corp., Milwaukee, Wis. (Assignee)
P. M. Thayer.
U. S. Patent No 3,802,676, 4 p, 10 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 921, No 2, p 619, April 9, 1974.

Descriptors: *Patents, *Aeration, *Sewage treatment, *Waste water treatment, *Pollution abatement, *Water pollution control, *Water quality control, Equipment, Methodology.

A method of installing an aeration system in a sewage treatment tank includes the steps of prefabricating headers having transversely-extending connectors longitudinally spaced along the header. Next the connectors are threaded to receive air diffusers which support the header in a tank to extend horizontally therein. The position of support of the header is adjusted to obtain a desired uniform depth in the tank for the header. The header is leveled and rotated on its axis to level the connectors, and air diffusers are attached to the connectors. (Sinha-OEIS)
W74-09176

APPARATUS FOR EFFECTING PURIFICATION OF LIQUIDS BY FLOTATION,
Aktiebolaget Electrolux, Stockholm (Sweden). (Assignee)
S. E. A. Svantesson.
U. S. Patent No 3,799,345, 4 p, 3 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 920, No 4, p 1201, March 26, 1974.

Descriptors: *Patents, *Flotation, *Water purification, *Waste water treatment, *Water pollution treatment, *Pollution abatement, Equipment, Bubbles.

In the purification of liquids by flotation, a mixture of gas and liquid is subjected to sufficient pressure for the gas to dissolve in the liquid and form a solution of the gas and the liquid. The solution of gas and liquid without any substantial change in pressure is introduced at a low velocity to the body of polluted liquid in a flotation tank. Initially no gas bubbles are formed. As the solution rises slowly in the tank and it is subjected to a gradually lower pressure, gas bubbles are formed in a gentle manner. Due to the slow rate at which this takes place the gas bubbles will be very small. Since a great quantity of gas is dissolved in the liquid, a large quantity of gas bubbles will be formed. All of these factors contribute to an effective purification of polluted liquids by flotation. (Sinha-OEIS)
W74-09180

APPARATUS AND METHOD FOR TREATING SEWAGE,
R. Freese.
U.S. Patent No. 3,799,346, 8 p, 13 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 920, No 4, p 1202, March 26, 1974.

Descriptors: *Patents, *Pollution abatement, *Aeration, *Chlorination, *Sewage treatment, *Water pollution control, *Water quality control, Equipment Waste water treatment.

A primary waste receiving and mixing vessel is provided for receiving raw sewage and breaking down the larger pieces of raw waste to a suspension of small particles in a liquid. This suspension is pumped into a bottom region of an aeration vessel. A venturi aerator is provided on the outlet side of the pump for introducing air into the stream of sewage being pumped into the aeration vessel. The aeration vessel contains a series of downward inclined baffles which are arranged to trap pockets of air and to circulate the sewage along a tortuous path across these air pockets. A recycling system is provided to recycle a portion of aerated sewage from a top region of the aeration vessel back into the primary mixing vessel for mixing with the raw, unaerated sewage and a second recycling system is provided. A settling tank is provided for receiving aerated sewage and separating activated sludge from the liquid portion of the sewage. The liquid portions can be chlorinated and the separated activated sludge is returned to the aeration vessel for mixing with the aerated sewage. (Sinha-OEIS)
W74-09181

APPARATUS FOR CLEANING MUDDY WATER,
F. I. Stewart.
U.S. Patent No 3,799,349, 4 p, 4 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 920, No 4, p 1203, March 26, 1974.

Descriptors: *Patents, *Mud, *Sediment discharge, *Water treatment, *Water pollution control, *Pollution abatement, *Water quality control, Equipment, Separation techniques, Silt.

To remove mud, sediment or silt from a body of water, a conduit is provided. The conduit is perforated at the top to trap sediment. Within the conduit there is a flexible conveyor which can be moved through the conduit carrying the trapped sediment out of the conduit for disposal. (Sinha-OEIS)
W74-09182

FLOTATION APPARATUS,
Degremont Societe Generale d'Epuration et d 'Assainissement, Rueil-Malmaison (France). (Assignee).
V. Savall, and P. Treille.
U.S. Patent No. 3,799,350, 3 p, 2 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 920, No 4, p 1203, March 26, 1974.

Descriptors: *Patents, *Water purification, *Flotation, *Waste water treatment, Equipment, Separation techniques, Bubbles.

A flotation apparatus comprises essentially a parallelepipedic tank disposed horizontally and provided along its major axis with open-top, pot-like injectors for the liquid to be treated with another liquid saturated with gas under pressure. The liquid to be treated is delivered through the bottom and preferably centrally of each injector, and the treatment liquid is supplied through a lateraleccentric but non-tangential pipe. Siphons are provided along the major side walls of the tank and are adapted, in conjunction with the injectors, to create outward and downward fluid flow passing under the siphons, other means being provided for removing the top sludge from one end of the tank. (Sinha-OEIS)
W74-09183

METHOD AND APPARATUS FOR FLOCCULATION OF DISSOLVED SUBSTANCES,
A. S. King.
U.S. Patent No 3,801,482, 3 p, 3 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 921, No 1, p 300, April 2, 1974.

Descriptors: *Patents, *Nucleation, *Flocculation, *Waste water treatment, *Water pollution treatment, *Pollution abatement, *Water quality control, *Water treatment, Electrolysis.

The fluid to be treated is passed through an electrostatic field to neutralize particles within the fluid and initiate nucleation. The fluid is then subjected to electrolysis to increase nucleation and cause flocculation. Each treater has a metal outer shell which forms an outer electrode and an inner, tubular electrode which is concentrically disposed within the outer electrode. An annular treating region is located between an inlet and an outlet of the outer electrode. (Sinha-OEIS)
W74-09184

SEWAGE TREATMENT,
E. Luck.
U.S. Patent No 3,801,499, 6 p, 11 ref; Official Gazette of the United States Patent Office, Vol 921, No 1, p 304, April 2, 1974.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Pollution abatement, *Water pollution treatment, Alkalinity, Metals, pH, Bacteria, Fungi, Yeasts, Enzymes, Neutralization.

Various treatments are interrelated and are carried out so that a preceding treatment improves the capabilities of a succeeding treatment. The method of treating liquid sewage containing inorganic and organic components comprises adding an alkaline compound or a mixture of alkaline compounds, to precipitate out metals as insoluble carbonates, bicarbonates, hydroxides or oxides. The precipitates are easily removed. Sufficient alkaline material is added to raise the pH over 11 to destroy pathogenic and other bacteria. Enzymes from the bacteria are released into solution. Acid is added to lower the pH to 3.5 to 6.5. Bacteria, fungi or yeast are added to assist in decomposing organic components. After removing the dead organisms and other insoluble precipitates, the remaining liquid is neutralized. The neutralized liquid is then subjected to ion exchange to remove remaining unwanted ions. (Sinha-OEIS)
W74-09185

SYSTEM FOR TREATING DILUTE SLURRIES,
Westinghouse Electric Corp., Pittsburgh, Pa. (Assignee).
T. E. Lippert, C. D. Beristain, and M. Testa.
U.S. Patent No. 3,796,317, 4 p, 3 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 920, No 2, p 392, March 12, 1974.

Descriptors: *Patents, *Waste water treatment, *Pollution abatement, *Water pollution control, *Water quality control, Slurries, Equipment, Dewatering, Separation techniques.
Identifiers: *Pollution prevention.

A system for removing water from dilute slurries of the type discharged from waste water treatment plants, including feeding the dilute slurry into a reservoir and passing concentrically mounted endless screen and porous belts through the reservoir for absorbing water from the slurry is described. The water is squeezed from the belts and the thickened slurry is transported from the reservoir to a position for discharge onto the screen belt which moves in intimate contact with the porous belt. Such intimate contact facilitates further removal of water from the slurry by capillary action as the belts move linearly towards the end of the system. The belts then separate from each other. Water is squeezed from the porous belt and the screen belt with its slurry cake then runs through a pair of rollers for further slurry dewatering and compaction to a desired solids concentration. The dewatered slurry cake is then transferred to one of the rollers and subsequently removed from the system for ultimate disposal. (Sinha-OEIS)
W74-09188

WATER TREATING APPARATUS,
Union Tank Car Co., Chicago, Ill. (Assignee).
E. Salem.
U.S. Patent No. 3,796,319, 7 p, 2 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 920, No 2, p 392, March 12, 1974.

Descriptors: *Patents, *Water treatment, *Ion exchange, *Water purification, *Water quality control, Resins, Chemical reactions, Separation techniques, Anion exchange, Cation exchange.

Water is passed through a service layer of anion and cation exchange resins in a service zone. Then the water is passed through a leakage barrier layer of cation exchange resin. The anion exchange resin is regenerated in an anion regeneration zone, the cation exchange resin in a cation resin regeneration zone. A portion of the cation exchange resin is transferred to the service zone to establish a leakage barrier layer. The remainder of the cation exchange resin is mixed with the anion exchange resin, and the mixed resins are transferred to the service zone to establish a service layer of anion and cation exchange resins. (Sinha-OEIS)
W74-09189

APPARATUS FOR PROCESSING WATER,
Aktiebolaget Gustavsbergs Fabriker (Sweden). (Assignee).
P. E. Kosonen.
U. S. Patent No. 3,796,321, 3 p, 4 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 920, No 2, p 393, March 12, 1974.

Descriptors: *Patents, *Waste water treatment, *Phosphates, *Chemical precipitation, *Pollution abatement, *Water pollution control, *Water quality control, Potable water, Sedimentation.
Identifiers: Aluminum sulfate.

The apparatus comprises a first container in the form of a vertical cylinder to separate larger particles and a second container in the form of a vertical cylinder to separate precipitated particles. The second larger container surrounds the first container so that an annular gap is formed between the walls of the containers. There is a partition wall in the annular gap to form a channel for the supply of water from the first container to a precipitation zone in the annular gap on one side of the partition wall. The precipitate formed is deposited at the bottom of the gap during the passage of the water around the annular gap and the water thus treated passes through an outlet conduit on the other side of the partition wall. The invention specifically relates to the precipitation of phosphates in the waste water by the addition of aluminium sulfate. (Sinha-OEIS)
W74-09190

AERATION APPARATUS FOR LIQUIDS,
J. R. Kaelin.
U.S. Patent No. 3,796,417, 5 p, 2 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 920, No 2, p 417, March 12, 1974.

Descriptors: *Patents, *Sewage treatment, *Waste water treatment, *Aeration, Equipment, Activated sludge, Impellers.

An aeration impeller consists of two suction sides arranged above one another working in opposed directions. Guide channels connect each suction side with the discharge sides of the aeration impeller. The operation comprises the steps of arranging the aeration impeller in an aeration tank having a subsequently arranged settling tank of a sewage purification plant, and delivering activated sludge from the settling tank to one suction side of the aeration impeller. (Sinha-OEIS)
W74-09191

FEASIBILITY STUDY OF HYDROCYCLONE SYSTEMS FOR DREDGE OPERATIONS,
Oklahoma State Univ., Stillwater. Office of Engineering Research.
W. G. Tiederman, and M. M. Reischman.
Available from NTIS, Springfield, Va 22151 AD-766 212 as Price $5.25 printed copy; $1.45 microfiche. Army Engineer Waterways Experiment Station Contract Report D-73-1, July 1973. 176 p, 40 fig, 22 tab, 10 ref, 6 append. USCE Contract DACW 39-72-C-0050.

Descriptors: *Water pollution control, *Dredging, *Desilting, *Separation techniques, *Sediments, Sedimentation, Flocculation, Silting, Sediment control, *Waste water treatment.
Identifiers: *Hydrocyclones, Chemical treatment.

Hydrocyclone separators were tested for use in concentration and clarification of dredge spoil. The feasibility of using hydrocyclones for the recovery of sand and gravel while rejecting fine silt was also investigated. Six dredge spoil samples, two clay slurries, and one sand were used to determine the effect of particle size, viscosity of the fluid, and inlet solids concentration upon the effectiveness of the hydrocyclones. While the clarification and concentration performance of the hydrocyclones was good on clay slurries, the performance ranged from below average to poor on the spoil samples. The poor capability of the separators to clarify and to concentrate these spoils was due to the combination of high solids content, small particle sizes and highly pseudoplastic (high viscosity) behavior of the spoils. Centrifugation and chemical treatment were also ineffective. Spoils with solids contents less than 100 g/liter could be flocculated but the flocs were too fragile to survive in the hydrocyclones and neither clarification nor concentration was enhanced by the treatment. The high solids content affects clarification more than it does concentration; thus hydrocyclone concentrators were reasonably effective on all but the spoils of highest solids content. The hydrocyclone was very successful at recovery sand. The hydrocyclone system is recommended for this application of classifying the solids in dredge spoil. (Knapp-USGS)

TRACE METALS IN EFFLUENTS FROM METALLURGICAL OPERATIONS,
Battelle Columbus Lab., Ohio.
J. B. Hallowell, R. H. Cherry, Jr., and G. R. Smithson, Jr.
In: Cycling and Control of Metals; Proceedings of Environmental Resources Conference, October 31-November 2, 1972, Columbus, Ohio: Environmental Protection Agency National Environmental Research Center, p 75-81, February 1973. 4 fig, 10 tab, 3 ref.

Descriptors: *Trace elements, *Water pollution control, *Industrial wastes, *Mine wastes, Wastewater treatment, Ion exchange, Oxidation, Evaporation, Biodegradation.

The current pollution control techniques associated with metallurgical operations are listed, and some examples of data describing the behavior of trace metals in waste streams from smelting operations are given. Two basic and relatively long-term approaches to control of pollution by waste streams are modification of processes to minimize or eliminate the waste stream, and segregation of waste streams to minimize the volume to be treated, to allow the use of a specific treatment method, and to maximize the effectiveness of the treatment. The modification of processes generally involves the time and cost associated with research, development, and equipment changes, while the segregation of waste streams usually involves alteration of existing plant facilities. The standard methods of separating suspended solids from liquid waste streams and particulates from gas streams are listed. (See also W74-09206) (Knapp-USGS)
W74-09212

POLLUTION ABATEMENT IN THE METAL FINISHING INDUSTRY,
Environmental Protection Agency, Edison, N.J.
J. Ciancia.
In: Cycling and Control of Metals; Proceedings of Environmental Resources Conference, October 31-November 2, 1972, Columbus, Ohio: Environmental Protection Agency, National Environmental Research Center, p 83-90, February 1973. 3 fig, 5 tab, 17 ref.

Descriptors: *Water pollution control, *Trace elements, *Industrial wastes, *Metallurgy, Waste treatment, Water reuse, Air pollution.
Identifiers: *Metal finishing.

The wastes produced in metal finishing facilities come mainly from the following sources: the dumping of spent baths; the rinse waters used to wash off process solutions; and accidental waste discharges. Other sources of waste include plant and equipment cleanup, entrainment of mists in exhaust ventilation ducts, regenerants from ion exchange units, and sludges resulting from deposits in process tanks and the precipitation of contaminants from wastes. The methods available for the abatement of pollution may be divided into two general categories: in-plant control techniques for conserving water and eliminating all unnecessary wastes, and the installation of treatment and recovery processes to destroy or remove toxic and objectionable materials in the effluent. (See also W74-09206) (Knapp-USGS)
W74-09213

CONTROL AND PREVENTION OF MINE DRAINAGE,
Environmental Protection Agency, Cincinnati, Ohio.
R. D. Hill.
In: Cycling and Control of Metals; Proceedings of Environmental Resources Conference, October 31-November 2, 1972, Columbus, Ohio: Environmental Protection Agency National Environmental Research Center, p 91-94, February 1973. 4 tab, 12 ref.

Descriptors: *Water pollution control, *Heavy metals, *Mine drainage, Acid mine water, Mine water, Mine acids, Mine wastes, Water pollution sources, Water pollution treatment, Trace elements, *Reverse osmosis, *Waste water treatment.

Polluted mine drainage occurs not only from the mine itself, but also from waste dumps and tailings areas. The ultimate solution to the mine drainage problem is preventing its formation. The reaction is dependent on air (oxygen) and water coming in contact with sulfides. All prevention techniques are based on excluding water and air from the mining environment. Several methods are available to treat the mine drainage that cannot be prevented. The most commonly used method for treating acid mine drainage and removing heavy metals is neutralization. Various ion exchange schemes have been applied to the treatment of coal acid mine drainage. Reverse osmosis (R.O.) also removes multivalent ions from mine drainage. With the use of electrodeposition processes, several metals, such as copper and iron, can be removed from mine drainage. The metal is deposited on the cathode of an electric cell from which it can subsequently be recovered. (See also W74-09206) (Knapp-USGS)

DEEP-BED FILTRATION,
BAMAG Verfahrenstechnik G.m.b.H., Butzbach (West Germany).
H. Jung, and E. S. Savage.
Journal of American Water Works Association, Vol 66, No 2, p 73-78, February, 1974. 10 fig, 2 tab, 5 ref.

Descriptors: *Design standards, *Filtration, *Filters, Potable water, *Water treatment, Waste water treatment.
Identifiers: *Germany, Deep bed filters, Backwash.

The advantages and disadvantages of deep bed filters which are utilized in Europe and other parts of the world are illustrated. Their chief advantage is their high specific loading. They make possible long filter runs and more finished water per wash than do shallower systems. They need less backwash water than do other systems. In some cases pretreatment can be reduced or eliminated. A disadvantage of deep bed systems is that deeper filter vessels are required which may preclude using such a system. In general, the trend is toward the deeper vessels because they avoid negative head loss in the filters at the end of each cycle. With deep beds and air water backwash, coarse media and low head loss filter bottoms may be used. The overall head loss is no more than generally experienced with shallower filters and in many cases may be less. Special consideration should be given to deep bed systems for process and potable water filtration when filter optimization is desired or the quantity of backwash water generated must be held to a minimum. CITY OF BRADFORD WATER DEPARTMENT, CHELLOW HEIGHTS TREATMENT PLANT.
Water and Waste Treatment, Vol 16, No 11, p 21-22, November, 1973. 3 fig.

Descriptors: *Water treatment, *Filtration, *Reservoirs, Filters, *Treatment facilities.
Identifiers: *United Kingdom.

The Chellow Heights water treatment plant is discussed. A filter building was constructed to replace, with a higher capacity, the existing outmoded filters. Also a new precipitation tank increases existing precipitation capacity. Maximum throughput was designed to be 40 mgd (1.60 cu m/sec). A covered service water reservoir is currently under construction and has a capacity of 140,000 cu m (30.8 mg). It is based on the prime elements of reinforced concrete walls, reinforced concrete columns, and a reinforced concrete roof. (Merritt-FIRL)

STARTUP AND OPERATION OF THE ROCKVILLE WATER TREATMENT PLANT,
Rockville Water and Aqueduct Co., Conn.
J. R. McQueen.
Journal of the New England Water Works Association, Vol 88, No 1, p 25-31, March, 1974.

Descriptors: *Treatment facilities, *Operation, Costs, Water quality, Water purification, *Waste water treatment, Iron, Activated carbon, Odor, Taste, *Connecticut, *Water treatment.
Identifiers: Manganese, Rockville(Conn).

The startup and operation of the Rockville Water Treatnt Plant is described. The plant is the result of 2 1/2 yr of planning and $2 1/4 million. Treatment in Rockville prior to this rapid sand filter plant consisted of chlorination which began in 1929, the addition of caustic soda in 1966 for corrosion control within the distribution system, and fluoridation required by state law in 1968. Complete startup toalok 18 days. On May 1, 1970 raw water began flowing through the plant and discharging back in Lake Shenipsit through the overflow piping of one of the clear water storage tanks. This was followed by chemical treatment stabilization, Board of Health inspections, and some piping changes. Five operators work a rotating shift schedule which requires that each operator would be involved in all aspects of the plant's operation and maintenance. The plant has effected a great improvement in water quality delivered to the system. Water color at the plant has been reduced from 10-30 to 2 units or less. Iron and manganese have been removed. Continuous activated carbon treatment has removed undesirable tastes and odors from the water. (Merritt-FIRL)

DESIGN OF FILTRATION PLANT FOR ROCKVILLE, CONNECTICUT,
Metcalf and Eddy, Inc., Boston, Mass.
A. Gammon.
Journal of the New England Water Works Association, Vol 88, No 1, p 19-24, March, 1974.

Descriptors: *Filtration, *Treatment facilities, *Design, Reservoirs, *Flexibility, Chemical treatment, Water purification, Pumping station, Buildings, Flocculation, Filters, Oxidation lagoons, Sludge disposal, Sludge storage, *Waste water treatment, *Connecticut.
Identifiers: *Rockville(Conn).

The design of a rapid sand filtration plant for the Shenipsit Lake Reservoir in Rockville, Connecticut is described. Due to the variations in raw water characteristics such as temperature from winter to summer, color, tastes, and odors, flexibility of chemical treatment was an important design consideration. The new low lift pumping station houses two 7.5 mgd vertical turbine pumps with space to permit the future installation of a third unit. The operations building houses all chemical storage and feeding equipment, with the exception of chlorine gas and sodium hydroxide. Each of the two treatment units has a flocculating compartment, a settling compartment, and a filtering compartment, all arranged concentrically with a 65 ft diameter circular tank. Lagoons were built to handle the waste water from filter backwashing, with sufficient volume to allow freezing of the sludge for ease in handling and disposal. (Merritt-FIRL)

PURE WATER SUPPLY DEVICE,
H. Nishizawa.
U.S. Patent No. 3,799,344, 3 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 920, No 4, p 1201, March 26, 1974.

Descriptors: *Patents, *Water supply, *Ion exchange, Equipment, Water purification, Water treatment.

An electromagnetic valve is interposed in a feed pipe that supplies untreated water and that connects with an ion exchange type pure water producing device. A conductivity detector and a flow passage change-over mechanism including a three-way cock are respectively incorporated and serially connected. A float moves vertically according to the water level in the pure water tank. Its movement is conveyed to a float switch by means of a connecting rod. The float switch is operatively connected to an electric circuit. When the float switch is closed, the electromagnetic valve opens and the feeding of water to the pure water producing device is effected to begin and the pure water is supplied to the pure water tank. ORGANIC MANAGEMENT REDUCES LEACHING OF NITRATE,
H. H. Koepf.
Bio-Dynamics, No 108, p 20-30, Fall, 1973. 4 tab.

Descriptors: *Nitrates, *Farm wastes, Investigations, Fertilizers, *Soils, Drainage, *Leaching, Silts, Loam, Runoff, *Illinois.
Identifiers: Organic management, *Waste management.

The reduction of nitrate leaching by the application of organic manuring fluids was investigated and compared with adjacent areas under orthodox commercial farming. The nitrate concentration in the tile drainage runoff was determined in four fields in Buffalo, Ill., from 1969-1973. The average monthly nitrate concentration is tabulated when there was a runoff from the tiles. It is concluded that fertilizing with commercial nitrogen interferes with the changes which the nitrogen continuously undergoes in the soil. The drainage outlets in the soils under investigation are rather close to the surface. Although in these silt loams it might take several months before water from the surface arrives at the depth of these tiles, the tests showed that the biological soil processes are a crucial factor which determines nitrate leaching. The cycles of mobilization-immobilization, nitrate supply for the crops, etc., seem to be different in soils under organic management from those in soils treated chemically. (Merritt-FIRL)

CRITIQUE OF WATER POLLUTION CONTROL ACT,
British Columbia Univ., (Vancouver). Westwater Research Centre.
A. H. J. Dorcey, and I. K. Fox.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 100, No EE1, p 141-151, February 1974. 1 tab, 3 ref.

Descriptors: *Federal Water Pollution Control Act, Standards, *Planning, Future planning(Projected), Water quality, *Water quality standards, Water management(Applied), *Canada.

The approach adopted in the Federal Water Pollution Control Act Amendments of 1972 is discussed. Specifically examined are the procedures envisioned to apply nationwide whereby: effluent and ambient standards are to be established and enforced; basin, state, and regional plans are to be developed; and water quality management facilities are to be financed. It is concluded that Congress may not be the best representative body to make some of the judgments that were made in the legislation; the enormous bureaucracy required by the legislation to achieve national objectives and to plan and implement water quality management programs is not necessary; and the effectiveness of the grant program is questionable. PROMOTING ENVIRONMENTAL QUALITY THROUGH URBAN PLANNING AND CONTROLS,
North Carolina Univ., Chapel Hill. Center for Urban and Regional Studies.
E. J. Kaiser, K. Elfers, S. Cohn, P. A. Reichert, and M. M. Hufschmidt.
Environmental Protection Agency, Socioeconomic Studies Series Report EPA-600/5-73-015, February 1974. 441 p, 17 fig, 20 tab, 360 ref.

Descriptors: *Comprehensive planning, *Planning, Non-structural alternatives, Social aspects, *Environmental effects, Land use, Air pollution, Regulation, Legal aspects, Local governments, *Urbanization, Urban hydrology, Zoning.
Identifiers: *Environmental quality, *Urban guidance systems, Noise.

The study focuses on the changing awareness and current practices in promoting environmental quality through urban planning and controls in local and metropolitan planning agencies. It includes a review of planning practices in the 1960's related to environmental quality; the results of a survey of urban planning agencies with regard to current planning for environmental quality; and a detailed examination of numerous planning approaches and controls considered to be promising for future environmental quality enhancement. The principal areas of concern are land use and comprehensive urban planning, water resource management and urban land-water interfaces, urban design, and the management of air quality and noise. The key concept of integration for the study is the urban guidance system approach which includes various planning activities, deci-

sion guides such as plans and policy statements, and action instruments such as ordinances, taxes, and public investments. An attempt is made to distinguish between the typical or mainstream planning approaches and controls and those which are new and innovative and therefore appear to have greater potential for promoting environmental quality in the future. Specifically within the water resource management area, the study focuses on two basic types of urban-water interfaces where promising approaches are taking place: those such as watersheds, wetlands, and floodplains where urbanization is taking place and transforming the nature of the water resource; and those such as urban sewerage and drainage systems where urban development has already occurred. F. J. Doyle, H. G. Bhatt, and J. R. Rapp.
Copy Available from GPO Sup Doc as EP1.23:670/2-74-009, $3.20; microfiche from NTIS as PB-233 026, $1.45. Environmental Protection Agency Technology Series Report EPA-670/2-74-009, February 1974. EPA Project 14010 HQC.

Descriptors: *Coal mine wastes, *Mine drainage, Wastes, Subsidence, Mining, Air pollution, Solid wastes, Erosion control, Sedimentation, Pennsylvania, West Virginia, Maryland, *Waste treatment, *Costs, Water pollution control.
Identifiers: *Pollution control costs, *Monongahela River Basin, Mine sealing, Refuse piles.

This report fulfills requirements for an effective, workable handbook on pollution control costs and factors effecting these costs for the Monongahela River Basin. The information is based on the latest technological developments and cost analyses of recent reclamation projects. Although the report was developed for the Monongahela River Basin study, the cost estimates and supporting data should prove useful for all of Appalachia and other areas with similar topography, mine drainage pollution problems and mining history. Specific areas covered are surface mines, refuse piles, mine sealing, mine drainage treatment, air pollution control, solid waste handling and disposal, abondoned automobiles, and erosion and sedimentation control. STREAM STANDARDS: DEAD OR HIDING,
Johns Hopkins Univ., Baltimore, Md. Dept. of Geography and Environmental Engineering.
M. G. Wolman.
Journal of the Water Pollution Control Federation, Vol 46, No 3, p 431-437, March 1974. 6 ref.

Descriptors: Rivers, *Streams, *Stream pollution, *Water quality standards, Water pollution, Costs, Dissolved oxygen, Dissolved solids, Turbidity, Pollutant identification.
Identifiers: *Stream standards, Biological measures, Standard parameters.

Water quality is not easily quantifiable, but is rather dependent upon perception of use. While the public is attuned to attributes such as algae, murkiness, suds, foam, cans, glass, and debris, scientists try to measure river quality by standard parameters such as dissolved oxygen, acidity, temperature, dissolved solids, turbidity, and biological measures such as the diversity of species, size of the population, and complexity of the system. To translate quality objectives into standards is quite difficult. In addition, economic benefits, as opposed to costs, are vaguely defined. Every water body has more than one polluter along with a number of pollutants, and reasonable standards must vary with perceived use of a particular river. (Prague-FIRL)

DEVELOPMENT AND FUTURE OF DREDGING,
Corps of Engineers, Atlanta, Ga. South Atlantic Div.
A. W. Mohr.
Journal of the Waterways Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol 100, No WW2, p 69-84, May, 1974. 4 tab.

Descriptors: *Water quality, *Dredging, *Equipment, Ecological balance, Channels, Costs.
Identifiers: *Hydraulic dredges, *Mechanical dredges, Waterway maintenance.

Dredging is performed either to gain the bottom material for fill or commercial use or to create and maintain waterways. This paper is concerned with the latter case, where the material itself is an unwanted by-product. Mechanical and hydraulic dredges are described with a series of tables, indicating the differences between the various types. New dredge designs must take into account the potential ecological damage which they cause, as well as economic advantages. Despite the new water quality requirements, both hydraulic and especially mechanical dredges should continue to have use. (Prague-FIRL)

HOW WELL DO ENGINEERS FORECAST DEMANDS,
Wisconsin Univ., Madison.
P. M. Berthouex, and K. Thiele.
Water and Sewage Works, Vol 121, No 4, p 54-56, April, 1974. 5 fig, 5 ref.

Descriptors: *Engineering, *Forecasting, *Engineering estimates, Treatment facilities, Water quality, Water quality standards, Design standards, *Demand.
Identifiers: *Accuracy.

The problems in making accurate engineering forecasts are discussed and methods to reduce the forecasting errors are suggested. Engineers face a difficult task in forecasting population, flows, organic loads, and other design inputs and then trying to design a treatment facility to accommodate these loads and have the real plant eventually function to satisfy standards that may exist, 10, 15, or 20 yr into the future. Changes in water quality standards may confront the engineer as an even greater challenge in future planning than population forecasting. If effluent standards or stream standards were clearly stated and the target were fixed, the engineer could plan the development of a treatment system in stages, according to a long term coordinated plan. He could try to take full advantage of economics of scale, of new technology, and of new design procedures. Uncertainty during design works against the designer accomplishing this goal. The impact of this uncertainty on implementation of pollution control technology is great. (Merritt-FIRL)

Descriptors: Water quality, Model studies, Stochastic processes, *Ohio River, *Missouri River, *Mathematical models.
Identifiers: *Spectral analysis, Water quality data, *Water quality models, *Parameter estimation, Stochastic data, Transient models, *Detroit River, *Coosa River.

This research was concerned with the analysis and interpretation of water quality data in order to develop improved mathematical models for predicting water quality. Spectral analysis was employed to analyze water quality data from the Coosa, Detroit, Missouri and Ohio rivers. Using the results of spectral analysis, mathematical models were developed to represent the processes taking place in the stream. Once the structural form of a model was obtained, parameter estimation techniques were used to determine the value of the constants and the parameters in the model equations. The study also includes (1) estimation of missing values in water quality data, (2) experimental simulation of thermal discharge monitoring and application of spectral analysis techniques, (3) compilation of water quality data and parameters from Kansas rivers and streams, (4) identification of parameters in transient water quality models from stochastic data, and (5) evaluation of methods for estimating stream water quality parameters in a transient model from stochastic data. The results of this research were reported in a series of publications, a list of which has been provided in this report. A summary of the significant results is presented under separate headings. The overall conclusion was that the different techniques of data analysis presented here were very effective in analyzing stream quality and would serve as valuable tools in model development.

Pittsburgh Univ., Pa. Graduate School of Business.
R. F. Byrne, and M. H. Spiro.
Swedish Journal of Economics, Vol 75, No 1, p 105-109, 1973. 1 fig, 14 ref. OWRR A-028-PENN(1).

Descriptors: *Economic efficiency, *Pollution taxes(Charges), *Pollution abatement, Standards, Return to scale, Mathematical models, Environmental control, *Taxes, Industrial plants, Water pollution control.
Identifiers: Indivisibilities, *Effluent charges.

It is generally assumed that the use of effluent charges to combat pollution is at least as efficient as the use of pollution standards. It is demonstrated both geometrically and mathematically that such charges may not be efficient when a firm faces a number of productive processes having fixed proportions of pollutants and outputs and constant returns to scale. It is shown geometrically for a firm with two processes and a single input. The alternative process model formulated may be typical of many polluting industries including the steel, phosphate, pulp and paper, and petroleum. The model also covers the common situation where the alternatives consist of one process with or without waste treatment facilities which display indivisibility characteristics. (Schroeder-Wisconsin)

FEASIBILITY STUDY OF A NEW SURFACE MINING METHOD 'LONGWALL STRIPPING,'
Potomac Engineering and Surveying Co., Petersburg, W. Va.
H. F. Moomau, F. R. Zachar, and J. W. Leonard.
Copy Available from GPO Sup Doc as EP1.23:670/2-74-002, $1.15; microfiche from NTIS as PB-233 146, $1.45. Environmental Protection Agency, Technology Series Report EPA 670/2-74-002, February 1974. 67 p, 4 fig, 22 ref. EPA Program Element 1BB040. Contract 68-01-0763.

Descriptors: *Environmental disturbance, *Surface mining, *Strip mining, Auger mining, *Longwall mining, Shortwall mining, Open-end outby, Fresh-air outby, Shallow cover mining, Roof-support, Shearers, Chocks, Conveyors, Continuous miner, Packwalling, Bench, Stowing, Highwall.
Identifiers: *Feasibility studies, *Mining, Coal mines.

'Longwall stripping' is a new surface mining concept developed by the Environmental Protection Agency. Longwall stripping adapts existing underground longwall mining technology for use in recovering shallow cover coal without the total environmental disturbance often associated with surface mining. This study investigated the environmental, mining and economic feasibility of longwall stripping. Longwall stripping was determined to be a feasible method for mining coal under shallow cover. A discussion of the criteria that are necessary to consider in selecting a site and developing the mining plan is included. Additionally, alternate methods of the longwall stripping concept are discussed. (EPA)

IN-PROCESS POLLUTION ABATEMENT: UPGRADING METAL-FINISHING FACILITIES TO REDUCE POLLUTION,
Oxy Metal Fisishing Corp., Madison Heights, Mich., Environmental Services Group.
A. E. Olson, and E. N. Hanf.
Environmental Protection Agency Technology Transfer Seminar Publication 1, July, 1973. 71 p, 25 fig, 4 tab, 14 ref, 2 append.

Descriptors: *Metallurgy, *Industrial wastes, *Pollution abatement, *Control, Water pollution control, Operations, Waste treatment, Air pollution, Industrial plants, Chemicals, Pollutant identification, Technology, Equipment, Water conservation, Toxins, Design, Safety, Economic justification, Metals.
Identifiers: *Metal-finishing industry, Exhaust systems, Ventilation.

A variety of chemicals are utilized in metal finishing to enhance the value of treated items. In-process water pollution abatement techniques are identified including equipment changes, chemical waste reduction, planning to prevent pollution catastrophies, and water conservation techniques. Methods discussed to reduce or eliminate chemical wastes include process substitution, reduction of process solution concentrations, and reduction of finishing solutions carried out over the edge of process tanks. A number of rinsing techniques are examined in attempts to conserve water. The monetary savings generated by the implementation of these methods is illustrated using a case study and cost figures. The ventilation of fumes from work areas and the removal of any contaminant from the exhaust stream that can cause air pollution are examined. Ventilation systems are recommended which meet the Occupational Safety and Health Act Standards and which contain the contaminant to a limited area. Exhaust systems should be constructed of corrosion-resistant and fire-retardant material to ensure long life. Wet scrubbers are designed to abate air pollution hazards with operating data for chrome and nickel-plating evaporator/scrubber systems provided. Appendixes illustrate floor plans, equipment protection, and ventilation systems utilizing pollution control devices. (Schroeder-Wisconsin)

DO NUCLEAR PLANTS MAKE DEADLY NEIGHBORS,
Washington Univ., St. Louis, Mo. Center for the Biology of Natural Systems.
B. Commoner.
Today's Health, Vol 50, p 25-27, 59, 62, 64, 67, February 1972. 1 chart.

Descriptors: *Background radiation, *Distribution patterns, *Nuclear reactors, *Radioactivity, *Rain, Nuclear wastes, Radioactive fallout, Atmosphere, Air pollution, Nuclear explosions, Radioactive wastes, Strontium radioisotopes, Radioactive waste disposal, Public health, Human diseases, Mortality, Radioactivity effects, Legal aspects, Economic aspects.
Identifiers: *Administrative regulations.

Rain can bring radioactivity from the air down to earth. Strontium 90, a chemical similar to calcium,

cannot penetrate more than an inch of living tissue, but once it is in the body, the isotope becomes closely packed around the living cells of the bone and presents a great risk of cancer. Strontium 90 is similar to calcium, so grass and food crops draw it from the soil, and foods carry it into our bodies. Experiments have shown that every exposure to radiation carries with it some risk of genetic damage or cancer. The United Nations Scientific Committee on the Effects of Atomic Radiation has estimated that due to nuclear tests through 1958 between 2,500 and 100,000 serious genetic defects have occurred. Dr. Ernest Steinglass estimates that fallout may be responsible for 400,000 infant and fetal deaths. In 1963, a research group was established to plan and conduct studies of environmental contamination due to release of radioactivity. The group recommended that radiation standards be reduced to one-tenth their present level. This recommendation was opposed by the Atomic Energy Commission and the nuclear power industry. In 1971 the AEC finally agreed to a reduction in permissible radioactive release. The experience with nuclear power warns that the capability to intrude on the environment far outstrips knowledge of the consequences. (Sperling-Florida)

IT'S ABOUT TOO LATE FOR TAHOE,
W. Bronson.
Audubon, Vol 73, No 3, p 49-80, May 1971. 2 photo.

Descriptors: Water pollution, *Water pollution control, Ecology, *Watersheds(Basins), *Zoning, Legal aspects, Legislation, Lakes, Wildlife, Wildlife habitats, Turbidity, Erosion, Eutrophication, Environment, Environmental effects, *Nevada, Basins, Land management, Lake basins, *California.
Identifiers: *Lake Tahoe.

The Tahoe Regional Planning Agency (TRPA), originally created to prevent the degradation of the Tahoe Basin, has failed to control the rush of urban development. The forest cover of the area, combined with ecological factors such as meadows, streams, lakes and talus slopes provide habitats for many vertebrates. However, TRPA's zoning plans could permit an increase in population in the area from a 1970 level of 28,000 to a possible 335,000. Water quality has been the primary environmental concern at Lake Tahoe, and the threat of water pollution triggered steps toward basin-wide pollution controls. Algae blooms have occurred due to excessive nutrient contribution and the entrance of turbid water through streams where development is proceeding in the watershed. Correction of the problem can only occur by controlling man-caused erosion in the watershed. However, serious siltation is predicted to continue, and if unabated will result in eutrophication of the lake. TRPA, a bi-state commission ratified by Congress in 1969, has done little to prevent the continuing development of the area, and environmentalists are now looking for the federal government to save Lake Tahoe, which is federally owned. (Ritchie-Florida)

The physical attributes of water and the legal authority to control pollutants in the water have necessitated intergovernmental responses in Broward County, Florida. Both the interior and coastal waters of Broward County are polluted by both natural and manmade pollutants including dead vegetation, effluent from utility and single installation treatment plants, industrial wastes, laundries, carwashes, on-site disposal facilities, marine toilets, oil from boats, power plants, septic tanks and leaching of soils, especially agricultural areas and fertilized land. Many of the canals in the county are non-flowing waterways with high coliform counts. The major source threatening to contaminate coastal water is wastewater disposal into these offshore waters. The primary interest in this highly urbanized area is in providing an adequate supply of fresh water for domestic purposes and in disposing of the wastewater with the least amount of damage to water sources. The nature of the water pollution problem has created a situation in which federal, state and local governments all have legal authority in the area of water pollution control. Federal funding and planning have stimulated the construction of regional sewage treatment plants, as well as encouraged state and local cooperation. (Silber-Florida)

NUCLEAR ENERGY AND THE ENVIRONMENT, AN INTERVIEW WITH A.G.C. COMMISSIONER DIXIE LEE RAY,
I. McManus.
American Forests, Vol 79, p 12-15, 42-47, August 1973. 1 chart, 1 tab, 11 photo.

Descriptors: *Electric power industry, *Nuclear energy, *Thermal pollution, *Nuclear wastes, *Nuclear engineering, Nuclear reactors, Electric power production, Cooling towers, Heated water, Water cooling, Water pollution sources, Fish farming, Surface irrigation, Materials engineering, Research facilities, Research equipment.
Identifiers: *Environmental impact statements, National Environmental Policy Act(NEPA).

Nuclear power plants produce excess heat which must be discharged into the environment. The heat is discharged into either the air or into water which is then cooled in condensers, stored in a cooling pond or tower, and ultimately discharged into a stream or river. Fossil fuel plants also discharge heat, but to a lesser extent than nuclear plants. Heated water may be beneficially employed to irrigate crops and warm the soil, possibly extending the growing season. Heated water can be utilized in aquaculture. The amount of excess heat discharged by breeder reactors now under development is approximately equal to that discharged by modern fossil fuel plants. The breeder concept has been known for a long time. There are several different possibilities for a breeder: a light water breeder, a gas breeder, a molten salt breeder, and a liquid metal breeder. A great deal of study involving all countries has led to the conclusion that liquid metal was the most promising. It is believed that there is now enough basic knowledge to construct a large-scale demonstration plant. Nuclear fusion, which utilizes heavy hydrogen found in seawater, is still a process for the future, but after breeder reactors, it offers the best hope for energy. (Sperling-Florida)

ONE DAMMED THING AFTER ANOTHER,
G. Marine.
Environmental Journal, p 14-19, May 1971. 6 photo.

Descriptors: *Lakes, *Rivers, *Dams, *Environmental effects, Salinity, Irrigation, Artificial lakes, Recreation, Hydroelectric power, Electric power, Hydroelectric plants, Structures, Flow, Floods, Flood control, Land reclamation, Land use, Land management, Swamps.

Dams are artificial objects whose purpose is to block or impede the flow of moving water. Some dams are built to restrict the flow of the water with the purpose of regulating its rate or changing its direction, commonly for the purpose of flood control or to regulate the flow so that areas downstream will be available for agriculture, recreation or settlement. In other cases the flow is regulated so that water will be available for diversion into irrigation ditches. At present, more than two thousand dams in the United States are completely silted, and several thousand more will silt over in the next fifty years. Dams at one time meant jobs, development and cheap electrical power, but dams cause extensive environmental damage and do not normally even pay for themselves. Recent studies show that both flood-control and reclamation dams ruin more land than they protect. Dams can cause salinization as well as other forms of irreparable and irreversible damage to water and land. Recreational benefits of artificial lakes have been exaggerated, and the hydroelectric power produced is not as cheap as it was once thought to be. (Ritchie-Florida)

WATER DISCHARGE PERMIT PROGRAM BEGINS DESPITE LACK OF EFFLUENT STANDARDS,
J. A. Noone.
National Journal, Vol 5, p 367-376, March 17, 1973.

Descriptors: *Water law, *Permits, *Water quality control, *Water pollution control, *Industrial waste disposal, Regulations, Wastewater disposal, Legal aspects, Water pollution sources, Water policy, Environmental sanitation, Navigable waters, Federal government, Standards, Administrative agencies, Impaired water quality, Sewage disposal, Water permits, Water utilization, Planning, Water resources development, Water management, Governments, Water treatment, Pollution abatement.

After a court imposed delay of 15 months, the federal government has begun the key element in its program to cleanse the nation's water--a system of permits that eventually will control discharges by some 56,000 industrial, agricultural and municipal polluters. The Federal Water Pollution Control Act of 1972 is the mechanism for carrying out the clean-water operation. The act sets exact limits on amounts of pollutants that can be discharged from specific sources. The new law requires all existing dischargers to meet two levels of standards. By July 1, 1977, industries must have the best practicable control technology currently available while publicly owned treatment works must use secondary treatment. By July 1, 1983, industries must use the best available technology economically achievable, while publicly owned sewage treatment works must have the best practicable waste treatment technology over the life of the works. The Act's main intent is to have all wastewater dischargers meet national effluent standards. The Act also retained the system of quality standards for receiving bodies of water. The permit program is the apparatus by which the two-pronged regulatory scheme functions. (Silber-Florida)

FLOATING BOOM,
N. P. Cerasari.
U. S. Patent No 3,800,542, 4 p, 13 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 921, No 1, p 68, April 2, 1974.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Pollution abatement, *Water pollution control, *Water quality control, Separation techniques, Equipment, Barriers.

A floating boom can be towed by a vessel around an oil spill or mass of flotsam to collect and contain it. The curved upper end of the support part decreases losses due to wave action. The floating boom comprises at lease three connector cables; the barricade may be solid, semi-permeable, or perforated. Horizontally spaced upright supports are attached to the cables. The supports have an upper curved section and a weighted end part, as well as valves for inflating the buoyant support tubes with compressed gas. (Sinha-OEIS)

APPARATUS FOR REMOVING OIL FROM WATER,
H. V. Hess, and E. L. Cole.
U. S. Patent No 3,800,950, 4 p, 5 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 921, No 1, p 172, April 2, 1974.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Pollution abatement, *Water pollution control, *Water quality control, Separation techniques, Foam.
Identifiers: Polystyrene foam, Agglomeration, Oleophilic plastic foam.

The method involves projecting open cellular particles of a highly oleophilic plastic foam such as polystyrene having a solvent affinity for petroleum. The oil agglomerates into lumps which can be contained and then burned or otherwise disposed of. The apparatus for carrying out the method includes a heated foaming vessel supplied with foamable plastic particles and means for projecting the particles, after they have been foamed or expanded, upon oil floating on a water surface. These means include a barrel to which the foamed particles are conveyed as well as propulsive means which disintegrate the foamed particles into relatively small particulates, which are then cast onto the oil. Preferably the oil is surrounded by the foamed particles. The apparatus can be mounted on a barge or other vessel. (Sinha-OEIS)

CENTRIFUGE COALESCER CONCEPT FOR SEPARATING OIL FROM WATER DISCHARGED FROM SHIPS,
Foster-Miller Associates, Inc., Waltham, Mass.
A. C. Harvey, A. R. Guzdar, V. K. Stokes, and A. T. Fisk.
Available from NTIS, Springfield, Va 22151 as AD-764 006, price $12.75 printed copy; $1.45 microfiche. Contract Report No 734305.2/3 for U.S. Coast Guard, February 20, 1973. 203 p, 56 fig, 16 tab, 14 ref, 3 append. 4305. Coast Guard Contract DOT-CG-24287 A.

Descriptors: Oil water, *Ships, *Separation techniques, *Centrifugation, Particle size, Water pollution control, Waste water treatment, *Oil wastes, Pollution abatement, Oil pollution.

A centrifuge was conceived and tested for separation of oil as it is usually dispersed in the bilge and ballast water of ships. The centrifuge is unusual in having predominantly axial flow, allowing comparatively high throughoput and low speed. It has both primary and secondary stages of separation and is thus capable of operating with high input concentrations. The device was tested in the laboratory using mixers in a storage tank and a centrifugal pump to disperse up to 8% oil in water. Effluent concentration in the range of 10 ppm were obtained with inputs containing 1000 ppm of No. 2, No. 4 and Nigerian Crude Oils. At higher concentrations ranging up to 58,800 ppm for No. 2 oil and 18,900 for No. 4 oil the effluent contained less than 100 ppm. Centrifuge performance on No. 2 and No. 4 oils containing 10% Gamlen D was lower than with pure oils. Coalescence occurred but produced drops smaller than with pure oils requiring a modification to the separator design. (Knapp-USGS)

FAILURE OF BRIBES AND STANDARDS FOR POLLUTION ABATEMENT,
Resources for the Future, Inc., Washington, D.C.
T. Page.
Natural Resources Journal, Vol 13, No 4, p 677-704, 1973. 4 fig, 20 ref.

Descriptors: *Pollution abatement, *Equity, *Industries, Water quality standards, Costs, Regulation, Permits, Governments, Economic efficiency, Welfare(Economics), *Pollution taxes(Charges), Government supports.

Coase's paper 'The Problem of Social Cost' (J. Law and Econ 1, 1960) instigated a series of discussions which emphasized the symmetrical nature of bribes and charges in achieving Pareto optimal solutions in the presence of externalities. The assumption of symmetry is challenged. Two questions are examined. First, the outcomes from bribes and charges, and standards and fees assuming free entry and exits and two industries--one polluting and one not--are generated. Equity conditions are also generated for the movement from pre to post regulation periods. The production function for the polluting industry assumes pollution is a factor of production rather than as a joint product. Pollution abatement is accomplished through the addition of pollution control equipment, changes in production practices, or reduction in output. Results from the modeling effort reveal that free entry and exit make standards and traditionally imposed bribes inefficient. Bribe systems designed to avoid the inefficiency appear either to closely resemble a fee system or to introduce a number of permanent inequalities. The fee system was found to be the best method of achieving both efficient and equitable results. (See also W74-09241) (Schroeder-Wisconsin)

BRIBES AND CHARGES IN POLLUTION CONTROL: AN ASPECT OF THE COASE CONTROVERSY,
Resources for the Future, Inc., Washington, D.C.
A. V. Kneese, and K-G. Maler.
Natural Resources Journal, Vol 13, No 4, p 705-716, 1973. 2 fig, 9 ref.

Descriptors: *Water pollution control, *Non-structural alternatives, *Pollution taxes(Charges), *Government supports, Industries, Welfare(Economics), Economic efficiency, Mathematical models.
Identifiers: Property rights, Equilibrium model.

Coarse initiated an intensive debate over the neutrality of property rights in an efficient allocation of resources. Several authors have claimed that the results are asymmetrical with respect to bribes versus charges. Critics have suggested, for example, that the analysis neglected differences in profit levels which result from varying property rights. Both a graphical analysis and a mathematical general equilibrium model are presented to prove the symmetry conditions. Three situations are examined under the general equilibrium model: (1) Pure charges strategy; (2) a mixed strategy utilizing both bribes and charges; and (3) a pure bribe strategy. It is shown that all three cases can lead to an efficient outcome. However, proof of symmetry is a hollow victory. The information requirements to yield an efficient system of bribes are tremendous. The federal government presently engages in subsidies to encourage pollution abatement. Generally, however, such subsidies are not tied to actual pollution reduction, but to construction cost of waste treatment facilities and may bias the economic alternatives of treatment techniques by not subsidizing by-products. THE ECONOMICS OF ENVIRONMENTAL QUALITY MEASUREMENT,
Ecology Audits, Inc., Dallas, Tex.
R. H. Schulze.
Journal of the Air Pollution Control Association, Vol 23, No 8, p 671-675, 1973. 5 tab.

Descriptors: *Pollutants, *Measurement, *Costs, *Professional personnel, Industries, Training, *Pollution abatement.
Identifiers: Environmental consultants.

The choice between employing environmental consultants and an in-house staff to evaluate the quality of air and water discharges is examined. Figures developed show daily in-house costs covering salaries, fringe benefits, supportive services, and recruitment, by employment categories. Also to be considered are cost of capital equipment and the costs of learning to utilize equipment and the regulatory agencies' framework. Alternatively, service company costs generally are a 2.5-5 multiple of base salaries, depending on part on the length of the contractual arrangement. Billing practices also vary, with some firms charging for all time consumed while other utilizing a rate equal to the time required for a seasoned professional. Also to be weighed are noneconomic factors for an in-house approach including secrecy, making-work, and flexibility, against assumptions of impartiality, availability, cost control and experience which favor a specific service. In general firms having $60,000/year of work per location expenditure with a service agency should consider an in-house process with subsequent auditing by a service agency. With $20,000-60,000 expenditures, in-house should still be considered if it can use under-utilized man hours. In each of these cases, cost is based on information of full time personnel handling these evaluations exclusively. (Schroeder-Wisconsin)

POLLUTION ABATEMENT IN A COPPER WIRE MILL.
Environmental Protection Agency, Washington, D.C. Div. of Technology Transfer.
EPA Technology Transfer Capsule Report 3. Industrial Demonstration Grant with Volco Brass and Copper Company, 1973. 11 p, 1 fig, 2 tab.

Descriptors: *Water pollution control, *Industrial wastes, *Water reuse, Economics, Profit, Copper, *Pollution abatement.
Identifiers: *Copper wire mill.

All copper wire drawing operations require cleaning of the rods before drawing to prevent impurities from being pulled into the drawn wire. This cleaning process, using hydrochloric or sulfuric acid, poses a number of effluent problems which when treated by traditional precipitation methods without changes in the manufacturing processes lead to exhorbitant cost increases and significant amounts of sludge. An alternative method was developed in a pilot study which reduces water consumption by 90% through chemical rinsing and water reuse. The sulfuric acid pickle is regenerated and high purity metallic copper recovered through continuous electrolysis. Hydrogen peroxide-sulfuric acid was shown to be a superior substitute for the chromates and fluoride and nitric acid previously used to remove cupric oxide in the copper rods from which copper wire is produced. Total solids leaving the plant were reduced from 2500 lb/day to less than 100 lbs/day and metal losses from 600-700 lb/day to less than one lb. The estimated saving of the new process over conventional precipitation techniques is estimated at about $2.61/ton of finished wire. A design for implementing the new process is included. NON-EFFICIENCY OBJECTIVES AND DECISION-MAKING IN WATER RESOURCE DEVELOPMENTS,
Massachusetts Univ., Amherst. Dept. of Agricultural and Food Economics.
G. A. Vaut, and C. E. Willis.
Water Resources Bulletin, Vol 9, No 6, p 1182-1187, 1973. 32 ref.

Descriptors: *Cost-benefit theory, *Regional development, Economic justification, Equity, Social values, Planning, Regional economics, Decision making, Management.
Identifiers: Social preference function, Multi-objective planning.

Major's proposed inclusion of a regional development objective into traditional public investment benefit-cost analysis represents a basic attempt to implement multi-objective planning (See W70-05577). His approach is evaluated and methods to weigh alternative objectives are examined. In Major's model, weighted regional benefits and costs are added to the traditional national income assessment. The inclusion of a regional objective represents an attempt to include equity considerations into the decision process. It may not be accurate however, to assume that equity considerations are positively affected by water resource development projects. The nebulous regional benefit concept would best be replaced by an operational measure of equity. Measurement problems associated with Major's model are also discussed and three methods to weigh nonefficiency objectives are examined. In the explicit approach decision makers are interviewed directly; in the implicit approach coefficients are inferred from previous decisions; both approaches depend on the consistency and candor of the decision maker. A third method suggested allows the investigator to generate a variety of weights, utilizing sensitivity analysis to suggest the impact of changes in weights on investment decisions. A modified benefit-cost approach is suggested which explicitly includes equity consideration and utilizes a combination of three weighing approaches. (Schroeder-Wisconsin)

Identifiers: *USSR.

Qualitative and quantitative changes in the growth of the Soviet national economy during the last several decades have called for a new approach to the utilization of the country's water resources. Use of water resources and, accordingly, construction of large hydraulic installations in the 1920's and 1930's were geared to meet the requirements of hydroelectric power and navigation in European Russia or of agriculture in Soviet Central Asia. In the 1950's and 1960's, the scope of water-resources management increased considerably and today includes virtually all branches of the national economy. Steps required to prepare plans and forecasts for water-resources development and water conservation in the USSR are examined, and emphasis is placed on the need to select alternative plans for evaluation of rates and trends of development of the national economy on the whole and of water management in particular. THE LONG-TERM STRATEGY FOR WATER RESOURCES IN THE UK.
Water Services, Vol 78, No 936, p 41-43, February, 1974. 1 fig.

Descriptors: Publications, *Water resources, *Long-term planning, Project planning, Water resources development.
Identifiers: *United Kingdom.

A report by the Water Resources Board of England examines the water resources of England and Wales as a whole and makes recommendations to meet the expected increase in the demand for water up through the year 2000. Findings indicate that no more than five new strategic reservoirs need be built. The report also considers a wide range of possible strategies for the Dee Estuary area where the need for water cannot be met from local sources; a strategy based on a mixture of inland and estuary storage making use of rivers to carry water is recommended. The report is summarized in outline form with project and research recommendations listed. (Sandoski-FIRL)

Descriptors: *Geothermal studies, Investigations, *Hydrogeology, *Aquifer testing, Drilling, Exploration, Hydrothermal studies, Borehole geophysics, Thermal water, Thermal power, Costs, Data collections, Hydrologic data.
Identifiers: *Geothermal power, *USSR.

Tremendous underground heat resources and simplicity of geothermal installations attract ever more attention of power engineers in many countries. To determine conditions and possible scale of earth heat effective utilization it is necessary to compare thoroughly geothermal sources with other energy sources. With increasing depth the thermal water temperature rises as well as the heat output of the well. Non-linearity of the well cost dependence with depth predetermines an optimal depth at which the best technical-economical characteristics of the well as an energy source are achieved. Data on geothermal conditions, well yields, and the influence of the depth on basic economical characteristics of geothermal heat sources are presented. (See also W74-08973) (Knapp-USGS)

EFFICIENCY AND EQUITY IN AUGMENTING WATER SUPPLY,
California Univ., Santa Barbara. Dept. of Economics.
L. J. Mercer, and W. D. Morgan.
Available from the National Technical Information Service as PB-233 131, $3.00 in paper copy, $1.45 in microfiche. Completion Report, December 1973, California Water Resources Center, Davis, Project UCAL-WRC-W-345. 15 p, 2 fig, 4 tab, 4 ref. OWRR A-041-CAL(1).

Descriptors: *Cost analysis, *Mathematical models, *Economic efficiency, Water supply, *Equity, Investment model studies, *Cost-benefit analysis, Taxes, Financing, *California.
Identifiers: Santa Barbara County(Calif), San Luis Obispo County(Calif), *Water supply augmentation.

This study includes analysis of two issues in augmenting water supply: efficiency and equity. The efficiency analysis rests on an operational (computerized) benefit cost model developed to evaluate the optimal timing of investment for water supply augmentation. Benefits in this model are estimated by both an opportunity cost approach and a willingness to pay approach with both parallel shifts and rotating (around the initial intercept) shifts of the water demand curve which is estimated in a linear fashion. The equity portion of the study entails analysis of the geographical distribution of benefits relative to payments with alternative plans for financing the study project. Plans analyzed include: (a) full reliance on a uniform countywide property tax to cover the financial obligation incurred; and (b) a unit charge (long run financial or resource cost) to water districts for delivered water and a countywide property tax to meet any remaining obligation. Analysis of geographical equity under alternative financing plans indicates that full reliance on a countywide property tax would be the worst solution. A combination of long run unit charges (either financial or resource cost) for water delivered and a countywide property tax in the early years to cover the remaining financial obligation is a superior financing plan from the viewpoint of equity among geographic areas as well as efficiency. (Snyder-California, Davis)

HYDROGRAPHY AND BEACH DYNAMICS,
Rosenstiel School of Marine and Atmospheric Science, Miami, Fla.
T. N. Lee, and B. J. Yokel.
Available from the National Technical Information Service as PB-233 165, $3.75 in paper copy, $1.45 in microfiche. Rookery Bay Land Use Studies, Study No 4. Published by the Conservation Foundation, Washington, D.C., November 1973. 51 p, 12 fig, 9 tab, 8 ref. OWRR C-4022(No 9004)(3), C-1817(No 3170)(3) and C-2201(No 3385)(3).

Descriptors: *Florida, Bays, Estuaries, Tides, Gulf of Mexico, *Hydrograph analysis, *Land use, *Beaches.
Identifiers: *Rookery Bay(Fla), Beach dynamics.

Hydrologic and beach dynamics studies were conducted in and near Rookery Bay Sanctuary south of Naples on the southwest coast of Florida. These studies determined water exchange rates, tidal range variations, the characteristics of the tidal prism, bottom contours, the basin capacities and changes occurring in the geometry of the channels connecting the Sanctuary system with the Gulf of Mexico. Rookery Bay has an average depth of 3.0 feet, a mean volume of 135 million cubic feet and an effective mean tidal prism of 154 million cubic feet. The mean renewal rate for Rookery Bay was estimated at between one and ten days, with the best estimate being 3.2 days. Henderson Creek has an average depth of 2.5 feet, a mean volume of 41.5 million cubic feet and an effective mean tidal prism of 37.1 million cubic feet. The mean renewal rate for Henderson Creek was estimated at between one and six days with the best estimate being two days. Data on mean high tide levels at four stations for 23 months were presented. It was shown that long-term studies are needed to accurately determine mean high water level and that serious sources of error may result from short term studies. The changing configurations of Keewaydin and Little Marco Islands are illustrated and the implication for the Sanctuary discussed.

QUALITY OF LIFE IN KICKAPOO VALLEY COMMUNITIES,
Wisconsin Univ., Madison. Inst. for Environmental Studies.
E. A. Wilkening, P. Wopat, J. G. Linn, C. Geisler, and D. McGranahan.
Report 11, September 1973. 114 p, 7 fig, 58 tab, 1 append. NSF GI-29731.

Descriptors: *Baseline studies, *Economic impact, *Social impact, *Reservoirs, Social aspects, Recreation, Tourism, Flood control, Environmental effects, Wisconsin.
Identifiers: *Kickapoo River(Wis.), *La Farge Dam(Wis.), Quality of life.

The Kickapoo River is the site of a proposed recreation and flood control reservoir in southwestern Wisconsin. This study sought to establish social and economic baseline information on communities to be affected prior to the project's completion. Information was gathered in 1972 primarily by a study of 12 communities--six within the project area and six outside the valley--by interviewing 18-23 leaders of each community. Additional data were collected from the U.S. Census Bureau and agency records. All six communities in the valley suffered declines in farm number, population, and cropland, which may have strongly influenced the desire for a permanent lake. Median income in the five county area ranges $1777-$3348 below the 1970 Wisconsin median of $10,068. Respondents rated services in each community on a continuum from 'very poor' to 'very good.' Areas evaluated included industrial opportunities, schools, health and medical facilities, special programs for the underpriviledged, water and waste systems, fire protection, flood protection, police, local business, transportation, housing, zoning adequacy, taxes, recreational facilities, and civic involvement. Majority of communities thought the dam would have some or a large effect but were uncertain as to the precise effect. The major benefit perceived was tourism, recreation, and new industries. 1971 UMPQUA RIVER ESTUARY RESOURCE USE STUDY,
Oregon Fish Commission, Port Orford. Div. of Management and Research.
T. Gaumer, D. Demory, and L. Osis.
Available from the National Technical Information Service as COM-73-11645. June 1973. 26p, 6 fig, 15 tab. NO4-3-208-55 DACW 57-72-C-0138 NOAA N208-0073-72(N).

Descriptors: *Fishing, *Oregon, *Recreation, *Estuarine fisheries, Fish migration, Shellfish, Herrings, Commercial fishing, Fish harvest, Systematics.
Identifiers: Umpqua River Estuary(Ore.).

In 1971 the Oregon Fish Commission instigated a comprehensive study of recreational use and users of 16 Oregon estuaries. Data collected on the Umpqua River Estuary, a 5712 acre bay containing 1531 acres of tideland and located 222 miles south of the Columbia River, are summarized. Interviews with 3985 boat, shore, tideland, and scuba users provided the basic data source, with additional commission reports providing commercial landings and values of fish and shellfish. Utilizing these data, maps identifying principal boat fishing areas, clam beds, eel grass beds, food production areas, fish feeding areas, fish migration routes and herring spawning areas were developed. Fish comprised 69 and 97% of boat anglers' and shore anglers' catches with striped bass and Pacific tomcod

respectively, representing the major catch for each category. Soft shell clams made up 100% of tideflat users' take. The estimated 196,300 total estuary catch represents 107,600 fish, 84,600 clams, and 4,100 crabs. Nearly 85% of anglers interviewed were Oregon residents, with 30% residents of Douglas county. Commercial landings of marine food fish and shellfish cought in the Umpqua River Estuary in 1971 totaled 333,376 pounds valued at $60,791. Shad was the principal species landed. (Schroeder-Wisconsin)

ENVIRONMENTAL QUALITY, INCOME DISTRIBUTION, AND FACTOR MOBILITY: THE CONSEQUENCES OF LOCAL ACTION,
New Mexico Univ., Albuquerque. Dept. of Economics.
G. C. Hufbauer.
Journal of Economic Issues, Vol VII, No 2, p 323-335, 1973. 4 tab, 6 ref.

Descriptors: *Environment, *Social adjustment, *Urban sociology, Local governments, Social mobility, Income distribution, Financing, Oregon, Community development, Economic impact.
Identifiers: Boulder(Colo.).

The consequence of a local community's environmental improvement programs on the income level of landholders, capitalists, and laborers and the social expectations of its inhabitants is examined. A model assumes an open economy, a single output produced, using two factors--land and a composite variable input composed of labor and capital--a balanced governmental budget, and environmental problems amenable to local solutions. A modified Harberger system of eight equations is used to determine the percentage change in output and factor quantities and prices. Costs to restore the environment to a priori standard are assumed to be proportional to expenditures per unit of variable input consumed; and in the alternative are assumed to be dependent on the total outlay. The elasticities of product demand and variable supply are assumed (equal to 10) and the elasticity of substitution assumed unitary. An environmental program financed through land taxes will not affect community outputs, enlarges labor and capital stock, and generates a rise in total wages. Alternatively, a tax on the variable factor depends on the capitalists' and laborers' valuation of the benefits of the program. If benefits exceed the costs and output rents, total variable wage and community population will increase. If costs exceed benefits, population, landholder, and variable factor earnings will decline. (Schroeder-Wisconsin)

MULTINATIONALS NEED NEW ENVIRONMENTAL STRATEGIES,
Denver Research Inst., Colo. Industrial Economics Div.
J. G. Welles.
Columbia Journal of World Business, Vol 8, No 2, p 11-18, 1973. 7 ref.

Descriptors: *Environment, *Management, *Industries, *Control, Social impact, Limiting factors. Recycling, Costs, Political aspects, Governmental interrelations, Trade associations.
Identifiers: Multinational companies, Global pollution control, Corporate responsibility, Pollution havens.

Three questions are examined based on a 1972 survey of environmental strategies gathered from 130 interviews of multinational firms' representatives, industrial trade associations, and financial institutions. The first question keys on ways to inject an environmental dimension into management decisions of multinationals. Methods discussed include the creation of corporate environmental managers, environmental site selection analysis, material balance analysis, and corporate environmental impact statements. Also discussed are changing managerial attitudes on the implication of environmental degradation by industry. The second question examines the responses of multinationals to 'pollution havens' in underdeveloped countries. Responses showed that only the highest polluting industries or those whose further expansions are blocked in their present location are likely to be attracted to 'pollution havens' and then with indeterminate benefits. The third question examines the multinationals' ability to stimulate more uniformity in pollution controls among nations and the resultant advantages. Aggressive cooperation between trade associations and government is asserted to be the best strategy to accomplish globally uniform controls. (Schroeder-Wisconsin)

A STOCHASTIC INVESTMENT MODEL FOR A SURVIVAL CONSCIOUS FIRM APPLIED TO SHRIMP FISHING,
Houston Univ., Texas.
R. G. Thompson, M. D. George, R. J. Callen, and L. C. Wolken.
Applied Economics, Vol 5, No 2, p 75-87, 1973. 6 tab, 12 ref.

Descriptors: *Decision making, *Commercial fishing, Marine fisheries, Shrimp, Texas, Risk, Capital supply, Economic justification, Mathematical models.
Identifiers: Texas Gulf Coast.

From observation that the growth in capacity of fishing firms on the Texas Gulf Coast has been less rapid than maximizing net worth subject to capital rationing would suggest, a stochastic capacity expansion model for a survival conscious firm is developed. In the model, the firm maximizes expected net worth at the end of a planning period, subject to the constraint that there is no (probability) chance for bankruptcy to occur. The control variable in the model is capacity units purchased for the planning period. The model is also compared to the simple maximization model. Under the latter, bankruptcy is not an unlikely result. The application of the survivor model to the shrimp fishing industry appears to justify the modest industry growth in periods of expected favorable returns. Two limitations are noted: First, the model assumes survival is paramount and may not be applicable when survival is not a primary consideration; also, the limitation of the constant marginal utility of income assumption. (Schroeder-Wisconsin)

DYNAMIC ECONOMIC MANAGEMENT OF MIGRATORY WATERFOWL,
G. M. Brown, Jr., and J. Hammack.
The Review of Economics and Statistics, Vol LV, No 1, p 73-82, 1973. 2 fig, 1 tab, 15 ref, 1 append.

Descriptors: *Mathematical models, *Waterfowl, *Management, Optimization, Wetlands, Hunting, Value, Ponds, Canada, United States, Costs, Benefits, Game birds, Welfare(Economics).

A model to estimate transient and steady-state conditions necessary to achieve a social optimum in the allocation of resources for waterfowl production is developed. Essential components of the model include a hunter net valuation equation assuming the value of bagged waterfowl is a function of income, number previously bagged, seasons hunted, and hunting cost. Cost functions to produce additional birds utilizing ponds and a waterfowl production function are also estimated. The model seeks to maximize the present value of net income stream through manipulation of two variables: number of waterfowl bagged, and number of ponds utilized. First order requirements assert the best stock level equates the natural resource (waterfowl) marginal growth rate with the discount rate. Two biological production functions, a multiplicative form and a modified Beverton and Holt relationship having a constant return scale are used to activate the model. Hunters' valuation was assumed to equal the compensating variation of consumer surplus. A 1969 survey of 5000 hunters in the Pacific Flyway was used to estimate the relationship. Optimal value from the model's assumption of pond costs of either $12 or $17 show 9.5-17.2 million breeders required instead of the existing 7.8 and from 2.0-7.5 million ponds contrasting the existing 1.3. DEVELOPING A STATE WATER PLAN--MUDDY CREEK DAM AND RESERVOIR, EMERY COUNTY, FEASIBILITY STUDY,
Rollins, Brown and Gunnell, Inc., Provo, Utah.
Available from the National Technical Information Service as COM-73-10385 $3.00 in paper copy, $1.45 in microfiche. Four Corners Regional Commission, Farmington, N.M. Report FCRC-TA-401-505-063, August 1971, 59 p, 18 fig, 13 tab.

Descriptors: *Feasibility studies, *Reservoirs, *Economic effciency, Capital costs, Operating costs, Cost-benefit analysis, Utah, Irrigation, Design, Land classification, Land use, Land tenure, Water rights, Surface water availability, Groundwater availability, Recreation, Water pollution control, Flood protection, Sedimentation, Colorado River Basin, Agriculture.
Identifiers: *Muddy Creek Reservoir(Utah).

The feasibility of a proposed dam on Muddy Creek located in southeastern Utah is examined. The creek is in the Dirty Devil River Basin, a portion of the Upper Colorado River Basin. Land in the project area is used primarily for the production of small grains, corn, alfalfa, and pasture for livestock, with a total of 8066 irrigated acres. A variety of data including distribution of crops, yields, land ownership, land classification, surface water supply ground water supply and water rights are discussed. The proposed reservoir will be a multipurpose facility including but not limited to irrigation, fish and wildlife, recreation and water pollution control. Construction design elements include a rolled earth and rock fill dam, outlet works, diversion and division structures, and a spillway. Total reservoir capacity inclusive of dead storage is expected to be 12,000 acre feet. The 50-year volume of sediment contained in the reservoir is projected to be 3200 acre feet. Total cost of construction is estimated at nearly $1,600,000. The combined direct benefits and repayment capacity of the project are shown to exceed $45,000 annually. (Schroeder-Wisconsin)

A TEST OF COMBINATIONS OF MODELS FOR PROJECTING THE POPULATION OF MINOR CIVIL DIVISIONS,
Rutgers - The State Univ., New Brunswick, N.J.
M. R. Greenberg.
Economic Geography, Vol 48, No 2, p 179-188, 1972. 1 fig, 3 tab, 46 ref. OWRR C-1629(3147) (6), 14-31-0001-3147.

Descriptors: *Forecasting, *Human population, *Spatial distribution, Planning, Social mobility, Growth rates, Cities, Suburban areas, Monte Carlo method, Regions, *Population, Projections.
Identifiers: *New York Metropolitan Region, Distributional factors, Municipalities.

Several methods to project population distributions and growth in minor governmental subdivisions are examined. Each method seeks to include

historical-behavioral changes which anticipate alterations in observed growth and distributions, at different spatial levels, and to minimize errors resulting from multiple assumptions. Population projections for 567 municipalities in the New York Metropolitan Region through 1985 are examined. The interpendencies and importance of zoning ordinances, property taxes, fertility levels, and transportation patterns are considered. Three projection methods are illustrated. A random sample of 10% of communities in the region over a five year period was conducted to illustrate how direct projections of minor governmental units' populations are made. These projections were developed assuming a geometric growth rate, a logistic rate, and a form developed by Newling. Alternatively, population projections were made by extrapolating from national projections. It was found that this ratio method was fruitful only if a number of behavioral trends could be inserted at varying spatial levels. A third approach first allocated national projections and then utilized direct projections to adjust the former. This method was found the most accurate and the most costly. The choice of projection methods depends on the willingness of the researcher to trade-off cost for accuracy. (Schroeder-Wisconsin)

A COST ANALYSIS OF WASTE MANAGEMENT IN THE STEEL INDUSTRY,
Environmental Protection Agency, Washington, D.C. Office of Research and Monitoring.
D. P. Tihansky.
Journal of the Air Pollution Control Association, Vol 22, No 5, p 335-341, 1972. FWPCA 5-FI-WP-26,285-02.

Descriptors: *Pollution abatement, *Cost analysis, *Mineral industry, Industrial wastes, Capital costs, Operating costs, Waste treatment, Maintenance costs, Water pollution control, *Steel, Industries, Economics.

Three levels of pollution abatement costs in steelmaking are examined. First, the overall costs to the industry are estimated for a 21-year period. Since 1951, U.S. steel corporations have expended $1.2 billion for air and water pollution abatement facilities. Current annual operating costs for gaseous and liquid waste reduction total an additional $70 million each. Pollution costs are shown to vary with the age of steel plants. Modernization, for example, can lead to improved pollution control through greater efficiency and economy in the use of resource inputs. A second level explores the abatement costs for a specific American steel company. This company expended $8 million for abatement equipment during the 1951-1967 period. Operating expenses added an additional $750,000. Capital and operating costs are separated for air and water pollution abatement for the firm and the industry. The final level explored provides cost estimates of air and water pollution controls for typical steel production stages. Departments examined include the coke plant, blast furnaces, basic oxygen furnaces, blooming mill, sheet mill, continuous pickling, tube mill, and coupling, over the 1951-67 period. TOWARD A BETTER UNDERSTANDING OF RECREATIONAL BOATING IN THE ADIRONDACK LAKES REGION,
Northeastern Forest Experiment Station, Syracuse, N.Y. Recreation Research Unit.
H. E. Echelberger, and G. H. Moeller.
Water Resources Bulletin, Vol 9, No 6, p 1266-1271, 1973. 1 fig, 3 tab, 6 ref.

Descriptors: *Lakes, *Recreation, *Boating, Physical properties, Boat-launching ramps, New York, Management, Control, Correlation analysis.
Identifiers: *Adirondack lakes.

The relationship between lake characteristics and varying peak period boat use on the Adirondack lakes is explored to aid recreational management decisions. The 14 lakes ranging in size from 851 to 6976 acres are located in the New York Adirondack Forest Preserve. Data were collected on four warm sunny weekend afternoons at three half-hour intervals, a time considered to represent the peak period. Holiday weekends were excluded. Boat counts were made by aerial observations on 12 lakes with surface counts for the remaining two. Boat user counts were averaged to determine the average peak use by lake. A number of variables including accessibility, lake configuration, commercial lodging accommodations, traffic volume, proximity of the lakes, launching facilities, and boat slips were hypothesized as having influence on peak user rates. To estimate the relationship, factor analysis was used to reduce the number of variables that were functionally related followed by stepwise regression. Results indicate that 69% of the variation in peak usage is accounted for by the number of launching facilities with accommodation boat slips; lake size and shoreline also affect usage. Accessibility, landscape quality, traffic volume, and availability of other lakes were found to be unrelated to usage. (Schroeder-Wisconsin)

1971 TILLAMOOK BAY RESOURCE USE STUDY,
Oregon Fish Commission, Port Orford. Div. of Management and Research.
T. Gaumer, D. Demory, and L. Osis.
Available from National Technical Information Service as COM-73-11688. August 1973. 28 p, 7 fig, 15 tab. DACW 57-72-C-0138, NOAA N208-0073-72(N) and NO4-3-208-55.

Descriptors: *Oregon, *Recreation, *Estuarine fisheries, Fishing, Shellfish, Fish, Commercial fishing, Systematics, Fish harvest.
Identifiers: *Tillamook Bay(Ore).

The Oregon Fish Commission initiated a comprehensive study of recreational users and uses of 16 Oregon estuaries in 1971. Data collected on Tillamook Bay, the third largest bay in the state encompassing 4163 acres of tidelands are summarized. Interviews with 15,700 boat and shore anglers, tideflat users, and scuba divers provided much of the data, with additional commission reports providing information on commercial landings and values of fish and shellfish. From this information, maps identifying principal boat fishing areas, clam beds, eel grass beds, commercial oyster leases and potential growing areas, fish feeding areas, migration routes, and herring spawning areas were generated. Dungeness crabs and chinook salmon accounted for 96% of the boat anglers' catch; 17,500 shore angler trips were also expended with 52% of their activity concentrated on the bay's north jetty. Pile perch and kelp greenling represented the principal species taken by this group. Of the 24,500 tideflat user trips, 98% were expended for calm digging. Nearly 73% of the bay users were Oregon residents, 21% were Tillamook County residents, and 6% were nonresidents. Commercial landings of marine food fish and shellfish caught in 1971 totaled 343,130 pounds valued at $300,009. Oyster was the principal species harvested. (Schroeder-Wisconsin)

THE ECONOMICS OF THE SMALL GEOTHERMAL POWER STATION,
Department of Scientific and Industrial Research, Wairakei (New Zealand). Chemistry Div.
R. James.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1697-1704, 1973. 6 fig, 14 ref.

Descriptors: *Thermal power, *Geothermal studies, *Electric power costs, Economies of scale, Costs, Income, Prices.
Identifiers: *Geothermal power, *New Zealand.

A geothermal borehole, Tauhara No. 1, near Taupo, New Zealand, was investigated for the economics of generation of electrical energy and for the industrial application of the large amount of heat energy usually wasted in the rejected bore water. A power plant of 10 MW(e) could be erected for about 1.14 million dollars (N.Z.) at a generating cost of about 0.2 cents/kWh(e), which is a very attractive figure. The specific cost per kilowatt of small plants could be as cheap as that of very large plants, in other words, the 'scale effect' does not apply for geothermal power in New Zealand. An enormous volume of hot fluids is rejected at large geothermal projects such as that at Wairakei. The heat energy, if sold at even half the price of that produced by coal-fired boilers, would realize about 6 million dollars per year. (See also W74-08973) (Knapp-USGS)

ECONOMICS OF THE GEYSERS GEOTHERMAL FIELD, CALIFORNIA,
Thermal Power Co., San Francisco, Calif.
D. A. McMillan, Jr.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1705-1714, 1973. 5 fig, 1 tab, 56 ref.

Descriptors: *Thermal power, *Geothermal studies, *Electric power costs, *California, Economies of scale, Costs, Income, Prices.
Identifiers: *Geothermal power, *Geysers field(Calif).

The economics of The Geysers geothermal field located approximately 75 miles north of San Fran-

cisco, California, is discussed. At plant use conditions The Geysers geothermal field produces a dry, slightly superheated steam of which about 0.5% are non-condensable gases. The cost of the geothermal energy at The Geysers is lower than $0.005 per kWh produced. This cost is calculated on the basis of the actual price of the steam $0.0026. The average cost of conventional thermal and atomic electrical power in California is around $0.007 per kWh. The corrosion, incrustation, and waste water disposal problems are under easy control in The Geysers field. The conservative cost of $0.005 per kWh is inclusive of those expenses. (See also W74-08973) (Knapp-USGS)
W74-09046

ECONOMICS OF GEOTHERMAL ELECTRIC POWER GENERATION AT MATSUKAWA,
Japan Metals and Chemicals Co. Ltd., Tokyo. Exploitation Dept.
S. Nakamura.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1715-1716, 1973.

Descriptors: *Thermal power, *Geothermal studies, *Electric power costs, Economies of scale, Costs, Income, Prices.
Identifiers: *Geothermal power, *Japan(Matsukawa).

The economics of geothermal power at a site in the Matsukawa area of the Iwate Prefecture, Japan, is discussed. The total expenditure for surveys and research came to approximately yen 160,000,000. During the approximately 6-year survey period, the major part of this expenditure was for five test borings. Six steam wells were drilled to depths of 1000 to 1500 meters at a cost of yen 439,000,000. Compared with costs in Italy, New Zealand, and the United States, this figure is rather high. However, this is the first such development project in Japan, and so, in addition to the lack of precedent, there were problems concerning drilling technology and machinery. Total cost of constructing the 20,000 kW plant (including interest and all connected costs) was yen 2,057,000,000. Construction cost per kW was yen 102,850, about 1.5 to 2.0 times that for domestic thermal power generation plants. At yen 2.63/kWh, the present cost of generation is on a level with that of thermal power. However, the fuel supply is inexhaustible, and there is no expenditure for the fuel. (See also W74-08973) (Knapp-USGS)

MEETING WATER DEMANDS IN THE CHINO-RIVERSIDE AREA,
California State Dept. of Water Resources, Sacramento.
C. R. White.
Bulletin No 104-3, May 1971. 27 p, 20 fig, 3 tab.

Descriptors: *Water supply, *Groundwater, *Planning, *California, Alternate planning, Economic impact, Land use, Surface water, Water sources, Value, Water management(Applied), Imported water, Water storage.
Identifiers: *Southern California, Chino-Riverside area(Calif.).

The California Chino-Riverside area occupies 641 square miles throughout portions of Riverside, San Bernardino and Los Angeles counties. The 1965 water demand for the area was approximately 450,000 acre-feet; it is estimated to reach 850,000 by 2015. To meet this projected demand an investigation of alternative supply sources was conducted. Nearly 12 million acre-feet of water is stored in ground water basins in the area, which is replenished at an annual average of 394,000 acre-feet. Current ground water extraction accounts for 70% of the demand with imported water from the Bunker Hill-San Timoteo Basin and the Colorado River covering 18% and 6% of the total. Four plans to meet future demand are considered. First, a maximum amount of imported water for artificial recharge while using ground water for demand. Plan 2 also maximizes imported water for direct delivery while reducing ground water pumping. Both plans would increase ground water storage by 2015. Plan 3 uses a maximum of ground water without depleting the last 50 feet. Plan 4 would stabilize existing water levels, supplementing pumping with imported water. Water sources, water quality, and costs were estimated for each plan. The least expensive alternatives are 1, 3, 4 and 2, respectively. (Schroeder-Wisconsin)

MEETING WATER DEMANDS IN THE RAYMOND BASIN AREA,
California State Dept. of Water Resources, Sacramento.
Y. Higashi.
Bulletin No 104-6, June 1971. 54 p, 29 fig, 15 tab, 13 ref.

Descriptors: *Water demand, *Groundwater availability, *Conjunctive use, *Alternate planning, Geohydrology, Legal aspects, Safe yield, Water quality, Water spreading, Water costs, Water distribution(Applied), Imported water, Watershed management, Water supply, California, Watersheds(Basins).
Identifiers: Raymond Basin(Calif.).

A three phase investigation examining the geology, hydrology and operation-economics was conducted to provide local agencies in the Raymond Basin area information on a wide range of alternative combinations of water supply sources and facilities. The basin is located immediately northeast of Los Angeles. The first two phases of the investigation yielded data on local availability of water supplies, water quality, and information on the characteristics of the basin. A mathematical model was also developed to simulate future water level fluctuations in the basin. Demand is expected to grow from 52,000 acre-feet in 1970 to 70,000 in 2020. The ground water is identified as one of the most significant sources of water; in 1970, nearly one million acre-feet was stored in the basin. Net future replenishment under mean hydrologic conditions is estimated at 24,600 acre-feet. Four plans are examined to meet future demands. These plans vary from relying exclusively upon the basin's ground water to the exclusive use of imported water. Facilities, costs and resultant ground water levels are explored for each plan. (Schroeder-Wisconsin)

THE UPPER HUDSON WHITEWATER OR WASHWATER,
L. Pringle.
Audubon, Vol 73, No 2, p 88-100, March 1971. 1 map, 1 photo.

Descriptors: *Hudson River, *New York, Dams, *Damsites, *Water distribution, *Water demand, *Environmental effects, Flow, Flow control, Measurement, Instrumentation, Water costs, Water delivery, Water management(Applied), Water purification, Reservoir storage, Desalination, Water shortage, Wildlife, Habitats, Wildlife conservation, Balance of nature, Recreation.
Identifiers: Whitewater canoeing.

Increased water demands by New York City have spawned the idea of constructing a dam on the Upper Hudson River. Conservationists have studied the probable effects on the Adirondack Forest Preserve. These effects include destruction of unbroken forests as well as the habitat of many Adirondack animals. Also destroyed would be scores of rapids, which provide whitewater canoeing for people in the Northeast. Alternatives to the dam construction involve better use and reuse of New York's existing water supplies. Metering and revision of free schedules which favor heavy users would help reduce demand on such supplies. In addition, millions of gallons of water could be saved by eliminating wastes in plumbing facilities. While conservationists argue for recycling of water, some water engineers contend that present facilities are inadequate to remove some viruses and other pathogens. Desalinization plants are another alternative, but the largest plant in operation, located in Key West, Florida, produces 2.6 million gallons of fresh water per day, compared with New York's approximate consumption of over 2 billion gallons per day. (Ritchie-Florida)

PUBLIC RESPONSE TO DESALTED SEA WATER,
California Univ., Berkeley. School of Public Health.
M. C. Chew, R. N. Mitchell, and W. H. Bruvold.
Journal of the American Water Works Association, Vol 66, No 1, p 8-13, January 1974. 3 illus, 2 photo, 4 tab, 9 ref.

Descriptors: *Desalination plants, *Water resources development, Desalination, Groundwater, California, Surveys, Saline water intrusion.

In a recently conducted state-wide survey in California, seventy-five percent of the respondents were unconvinced of whether a water shortage exists in the state, and a plurality expressed a preference for desalinized ocean water to supplement existing water supplies. The interviews were comprised of four sections. The first dealt with existing sources of supply and the adequacy of these supplies for the next fifteen years. The second dealt with the quality of the water currently being delivered to the respondents' homes. The third dealt with the use of desalted water in the respondents' homes, and the last dealt with the necessity of using desalted water in the community and the ways of making this matter known to responsible governmental bodies. Respondents were also questioned as to the advantages and disadvantages they perceived in the use of desalted water. An advantage frequently seen was that the use of desalted water would preserve ground-water levels, combat salt water intrusion, and allow reservoirs to be kept full for recreation. Disadvantages mentioned were the lack of minerals and fluorides and possible nuclear contamination. (Ritchie-Florida)

PROSPECTIVE COSTS OF ADJUSTING TO A DECLINING WATER SUPPLY: TEXAS HIGH PLAINS,
Economic Research Service, (USDA), Washington, D.C.
W. L. Harman, W. F. Hughes, and J. R. Martin.
Texas AES, Dept. of Agricultural Economics and Sociology, Departmental Technical Report No. 71-3, March 1971. 29 p, 1 fig, 3 tab, 5 ref.

Descriptors: *Agriculture, *Water supply, *Irrigation, *Income, *Efficiencies, Farm prices, Farm units, Water requirements, Dry farming, Land use, Texas, Linear programming.
Identifiers: *Texas High Plains.

The effects of declining water supplies combined with the growing cost-price squeeze had lead to declining income on irrigated farms of the Texas High Plains. While a number of alternatives to maintain income have been assessed, increased farm size appears to be the most promising source of relief. A multiperiod linear programming model is developed to determine minimum starting capital and the subsequent farm size adjustment necessary to obtain and maintain a disposable annual income of $7500, given three water supply situations--good, fair, and poor. The programming models generate capital flow, water use, ownership strategies and farm size changes as farm operations shift from irrigated to dryland farming. An essential requirement to accomplish the adjustment is the ability to generate substantial amounts of internal capital, while maintaining the minimum standard of life. Using 1966 prices, the poor and fair water supplies states are insufficient to generate adequate returns to absorb declining land values and maintain $7500 consumptive levels. For the study area, only 30% of the 6.9 million acres can be converted to dryland farming without sacrificing living standards or net worth. (Schroeder-Wisconsin)

6E. Water Law and Institutions

PROSPECTS OF SCIENTIFIC AND TECHNICAL COOPERATION BETWEEN THE USSR AND THE UNITED STATES IN THE USE OF WATER RESOURCES (PERSPEKTIVY NAUCHNO-TEKHNICHESKOGO SOTRUDNICHESTVA MEZHDU SSSR I SSHA V OBLASTI ISPOL'ZOVANIYA VODNYKH RESURS OV),
I. I. Borodavchenko, and Ye I. Serdyuk.
Vodnyye Resursy, No 4, p 193-196, 1973.

Descriptors: *Water resources development, *Water utilization, *Coordination, *Information exchange, *United States, Governments, Institutions, Planning, Programs, Projects.
Identifiers: *USSR, *International cooperation.

Forms of agreement on scientific and technical cooperative efforts of the USSR and the United States in the field of utilization of water resources are examined. Activities of the Soviet-American commission on scientific and technical cooperation and of Soviet-American working groups of specialists engaged in drafting specific proposals on cooperative programs are discussed. Basic problems necessitating coordinated efforts on the part of the two countries are outlined. (Josefson-USGS)

Copy Available from GPO Sup Doc as EP1.23:600/5-73-016, $3.80; microfiche from NIS as PB-232 955, $1.45. Environmental Protection Agency, Socioeconomic Studies Series, Report EPA-600/5-73-016, February 1974. 390 p, 126 tab, 26 ref. EPA Program Element 1HA097, R-801374.

Descriptors: *Surveys, *Environmental control, *Management, *Local governments, Cities, Attitudes, Water quality standards, Taxes, *Institutional constraints, *Water policy, Pollution taxes(Charges), Legal aspects.
Identifiers: *Environmental impact.

Results are presented of a study of environmental management and local government. The study has two main components: (1) a survey of chief executives in cities over 10,000 population and counties over 50,000; and, (2) a series of field studies of local environmental management in Dallas, Texas; Inglewood, California; Miamisburg, Ohio; and the Piedmont Triad Region (Forsyth and Guilford Counties), North Carolina. The major topics include: perception of the definition of environment, priority of environment as a local policy issue, and types of environmental problems facing each local government; adoption of local policy statement on the environment; existence of citizen environmental boards, environmental agencies, environmental sections in master plans, land use controls, other environmental controls, moratoria, environmental quality standards, environmental impact assessment procedures, environmental law suits, tax incentives and penalty charges; factors contributing to and factors creating obstacles to development of environmental programs; and, relations with state and federal agencies. THE ARCHAEOLOGICAL RESOURCES OF THE SALMON RIVER CANYON, A METHODOLOGY STUDY TO DEVELOP EVALUATION CRITERIA FOR WILD AND SCENIC RIVERS,
Idaho Univ., Moscow. Water Resources Research Inst.
E. H. Swanson, Jr.
August 1970. 20 p, 1 fig, 33 ref. OWRR Project B-014-IDA(4).

Descriptors: *History, Federal project policy, *River basins, *Evaluation, Human populations, Project planning, Project purposes, *Idaho, Canyons, Glaciers, Environmental effects.
Identifiers: *Archaeology, *Salmon River, *Wild and scenic rivers, Glacial climates.

The nature and significance of the archaeological resources of the Salmon River Canyon of Idaho are reviewed and discussed as part of a current project of developing criteria for classification of rivers prior to their inclusion into the National Wild and Scenic Rivers System. Archaeologically the canyon has scientific and historic importance because of the evidences of 2 important prehistoric indian cultures who occupied the area and the fact that the Salmon is a proglacial river whose terraces reflect glacial history, which in combination with evidences of early man should reflect man's relationship to the glacial history of the region. The historic inhabitants were Northern Shoshoni and Nez Perce groups who represented 2 major linguistic groups. Current evidence indicates that the area was not inhabited prior to major environmental changes 8000-8500 years ago. The significance of many archaeological sites are discussed. Archaeological sites are nonrenewable scientific and historic resources and therefore have intrinsic value which the federal government has been slow to recognize. Only a very small fraction of archaeological resources in the Columbia Basin have been explored because the government

requires considerable justification for such projects, but does not require justification for exploitive projects such as dams. (Casey-Arizona)

TRENT-WITHAM-ANCHOLME SCHEME AND PROJECT OF THE LINCOLNSHIRE RIVER AUTHORITY,
Lincolnshire River Authority (England). Water Resources Dept.
H. S. Hawkins, and J. D. Arrowsmith.
The Public Health Engineer, No 6, p 255-272, November 1973. 7 fig, 2 tab.

Descriptors: Water resources, *Water demand, *River training, *Control systems, Instrumentation, Pipelines, Design criteria, Reservoirs, Outlets, Pumping plants, Chlorination, *Water quality, Organizations.
Identifiers: *United Kingdom(Lincolnshire).

The organization and establishment of the Lincolnshire River Authority (LRA) is described. River authorities such as this were established under the Water Resources Act of 1963 to continue the function of land drainage and pollution control. A discussion of seven years' progress of the LRA is given. This includes: the Trent-Witham-Anchlome Scheme, public water supply demands, with charts of growth rates, direct demands by industrial and agricultural firms, and increasing demands of the 1970's. In addition, quality considerations were listed as the physical qualities of temperature, color, turbidity, and pH, the chemical qualities of alkalinity, total hardness, non-carbonate hardness, chlorides and dissolved solids, and pollution indicators such as ammoniacal nitrogen, dissolved oxygen, five day biochemical oxygen demand, and four hour permanganate value. The design criteria for this project fall into two categories--'Supply works' and 'Conservation Works'. Also discussed are particular sites such as Short Ferry, Fossdyke Canal, and Torksey Works. Specific problems including pipelines, chlorination, outfall works, and reservoir facilities are detailed. (Prague-FIRL)

WATER LAW AND THE HYDROLOGIC CYCLE: A TEXAS EXAMPLE,
Texas Tech Univ., Lubbock. Dept. of Geography.
O. W. Templer.
Water Resources Bulletin, Vol 9, No 2, p 273-283, April, 1973. 2 fig, 39 ref.

Descriptors: *Water law, *Legislation, *Texas, Riparian rights, Groundwater, *Hydrologic cycle, *Water rights, Water utilization, Water wells, Water yield.

The law divides water in the cycle into several different classes. Each is treated separately and generally without consideration of interconnections existing within the cycle. Different rules of law have arisen concerning the ownership and use of each legal class. Under Texas law several classes of surface and ground water are recognized, and weather modification efforts bring yet another class, atmospheric moisture, under consideration. It is instructive to follow water moving through the hydrologic cycle in the Nueces River basin, Texas, as a framework for discussing the substantial interconnections between the various legal classes of water and the difficulties that arise from attempts to apply different rules of law to each class. Strictures imposed by Texas water law can seriously interfere with coordinated, efficient use and management of water resources, as evidenced by the Nueces River basin. Well-recognized, existing water rights in the several phases of the hydrologic cycle make change of these institutional constraints difficult to achieve. (Skogerboe-Colorado State)

STATE EX REL. LUDWIG V. CITY OF BEMIDJI (ACTION FOR INJUNCTION AND DAMAGES AGAINST CITY FOR POLLUTING RIVER).
212 N.W.2d 876 (Minn. 1973).

Descriptors: *Minnesota, *Judicial decisions, *Water quality control, *Legal aspects, *Permits, Regulations, Standards, Water law, State governments, Administrative agencies, Environmental effects, Legislation, Ecology, Water resources, Appeals, Water policy, Natural resources, Pollution prevention, Pollution control, Pollution abatement, Municipalities.

A proceeding in the Supreme Court of Minnesota was brought by residents of a county to enjoin a city from polluting a river and to recover damages arising from the nuisance maintained by the city. The trial court dismissed the injunction suit and the plaintiffs appealed. The Supreme Court held that notice of hearing concerned with adoption of pollution standards was insufficient to confer jurisdiction upon the Pollution Control Agency to revoke a permit previously issued to the city. The Court further held that the city could not adequately prepare for a hearing which was designed to enforce a standard not yet adopted, and that failure to afford the city an individual hearing to resist the proposed order constituted a violation of the statute which operated to deprive the Pollution Control Agency of its jurisdiction over the city. Absent proper, prior notice that a hearing would be conducted to establish pollution standards, adopt regulations and revoke permits for sewage disposal in interstate waters, the city could not be amenable to the agency's jurisdiction. The judgement was affirmed. (Silber-Florida)

BLANEY V. RITTALL (ACTION ATTACKING PERMIT GRANTED TO CORPORATION WHICH ALLOWED THE BUILDING OF A WHARF).
312 A.2d 522 (Me. 1973).

Descriptors: *Maine, *Judicial decisions, *Legal aspects, *Permits, *Legislation, Standards, Environmental effects, Administrative agencies, State governments, Environmental protection, Estuaries, Wetlands, Natural resources, Land management, Land development, Water policy, Administrative decisions, Legislation, Ecology, Water resources, Water resources development, Coasts.

A proceeding in the Supreme Judicial Court of Maine was brought by an adjoining landowner under the wharves and weirs statute and the Wetlands Control Act attacking a permit granted by the Board of Selectmen of Boothbay Harbor to a corporation purporting to allow it to construct a wharf on its property. The Supreme Judicial Court held that the corporation was a proper appellant and, that because the corporation had failed to file a description or sketch of the affected land with its permit, the permit issued under the Wetlands Control Act was invalid. The corporation filed two applications and after notice and hearing, the municipal officers, with approval from the Wetlands Control Board, issued one permit authorizing the applicant to alter coastal wetlands. This action by the governmental agency was subject to appeal. The trial court found that an incomplete recording of the permit occurred which did not satisfy the statutory requirement and ruled that the permit was therefore void. The Wetlands Act requires that a license be approved if one seeks to alter or drain or deposit sanitary sewage on a coastal wetland, swamp, marsh, bog, etc. This judgement was thus affirmed. SUSQUEHANNA RIVER BASIN COMPACT.
Pa. Stat. Ann., secs. 820.1-820.8 (1968).

Descriptors: *Pennsylvania, *Interstate compacts, *Legislation, *Water law, *Water resources development, Water planning, Water development, Water management, Water policy, Interstate rivers, Cooperation, Coordination, State governments, Water rights, Equitable apportionment, Rivers, River basins, River basin development, Watersheds, Watershed protection, Inland waterways, Navigable waters, Water distribution, Water demand, Water supply, Water utilization.

The state's participation in the Susquehanna River Basin Compact (Compact) is authorized. The participants recognize their joint responsibility in the conservation, utilization, development, management and control of the water resources of the basin under a comprehensive multiple purpose planning effort which will bring the greatest benefits and produce the most efficient service in the public interest. One section of the component recognizes the interrelated interests and rights of the many sovereignties through which the river flows and the importance of inter-governmental cooperation and the establishment of a single administrative agency to effectively and economically direct the future of the area's water resources. Another important provision to all users of water and of water related facilities without regard to political boundaries. The Compact grants generous administrative powers to the agency in order that its purposes and intentions may be carried out with the maximum efficiency and in the best public interest. (Silber-Florida)

DITCH V. HESS (ACTION TO RESTORE FREE FLOW OF SURFACE WATER).
212 N.W.2d 442 (Ia. 1973).

Descriptors: *Natural flow doctrine, *Adjudication procedure, *Surface runoff, *Judicial decisions, *Obstruction to flow, Preferences(Water rights), *Iowa, Surface drainage, Riparian rights, Conjunctive use, Culverts, Water sources, Legislation, Relative rights, Remedies.

Plaintiff brought action to restore free flow of surface water from her land and to recover for crop damage which allegedly resulted from interference with such flow. The court held that plaintiff, as owner of the upper, dominant estate had a legal and natural easement in the lower, servient estate for drainage of surface water and the servient owner could not interrupt or prevent the natural flow or passage of waters to the detriment of the dominant owner. The court further stated the dominant owner could cast additional surface water upon the servient estate, as long as no substantial damage is done. The defendants, to whom a strip of land was conveyed for construction of an access road were entitled to maintain the roadway in a useable condition, but when the road is raised above the adjoining land, facilities must be constructed to permit free passage of water. Since defendants removed the drainage pipe from their access road, thereby causing damage to adjoining landowner's crops from the surface water remaining, an award of damages was justified against defendants and the drainage pipe was ordered restored. (Sutton-Florida)
W74-09130

JENKINS V. PEDERSEN (ACTION BY ADJOINING PROPERTY OWNER AGAINST NEIGHBOR FOR DIVERTING SURFACE WATER ONTO PLAINTIFF'S PROPERTY).
212 N.W.2d 415 (Ia. 1973).

Descriptors: *Iowa, *Judicial decisions, *Legal aspects, *Obstruction to flow, *Groundwater barriers, Riparian rights, Streamflow, Natural flow doctrine, Water policy, Water management, Diversions, Structures, Dams dikes, Water law, Flow control, Water control, Drainage, Runoff, Water distribution, Flooding.

A proceeding in the Supreme Court of Iowa was brought by property owners against adjoining property owners who allegedly diverted surface waters so they drained onto plaintiffs' property. The trial court awarded damages and granted a mandatory injunction. The defendants appealed and the Supreme Court reversed, holding that the jury's finding that the dike constructed by the adjoining owners did not contribute to the plaintiffs' damages was error. Furthermore, the trial court's granting of the mandatory injunction requiring removal of the dike was an abuse of discretion. Where surface water has a fixed and certain course, its flow cannot be interrupted to injury of an adjoining proprietor and equity will enjoin the obstructing of such natural flow of water when necessary to prevent irreparable harm. But a showing of irreparable harm is necessary to invoke the injunctive jurisdiction of the court. (Silber-Florida)

RAY V. RANOWSKY (INJUNCTION AGAINST CONSTRUCTION OF DRAIN IN WATERSHED).
210 N.W. 2d 810 (Mich. Ct. App. 1973). 5 p.

Descriptors: *Michigan, *Watersheds(Basins), *Constitutional law, *Assessments, *Drainage systems, Legislation, Right-of-way, Judicial decisions, Legal aspects, Construction costs, Water law, Watershed management.
Identifiers: Statute of limitations, Laches.

Residents of a Michigan watershed sought to enjoin the county drain commissioner from proceeding with construction of a watershed drain and assessment of the residents for the cost of the project. The drain commissioner is charged by Michigan law with determining the necessity for any such project, and plaintiffs argued that the cost of the project was an element in making that determination, which the commissioner had failed to consider. The Court of Appeals held that a required post-approval public meeting was the proper forum to review the benefits and cost of the project, and thus not an element of the determination of necessity. Plaintiffs argued that such a procedure would be a denial of due process, leaving them recourse only to challenge their individual assessments following approval of the plan. The Court concluded that special assessments are constitutional if founded upon special benefits which accrue to the landowners from the improvement. The Appellate Court then refused to overrule the finding of the trial court that the plaintiffs' land had benefitted in its use and resale value, and that the benefits were directly attributable to the drainage project. (Ritchie-Florida)

WEATHER MODIFICATION.
Pa. Stat. Ann., secs. 1101 thru 1118 (1968).

Descriptors: *Pennsylvania, *Artificial precipitation, *Cloud seeding, *Regulation, *Conservation, Water resources development, Legal aspects, Water shortage, Administrative agencies, Administration, Legislation, State governments, Adoption of practices, Coordination, Public health, Safety, Research and development, Aircraft, Rain, Dry seasons, Legal aspects, Decision making, Planning, Political aspects, Water resources.
Identifiers: *Administrative regulations, *Licenses, Notice.

The public health and safety require scientific experimentation to increase natural precipitation in order to develop, conserve, and to protect the natural water resources of the state of Pennsylvania. The statute creates a Weather Modification Board to advise the Department of Agriculture on these matters. A license is required by the department before any endeavor takes place to cause condensation or precipitation. It is unlawful to possess any cloud seeding equipment unless the possessor has a license or he is under contract with a person who has such a license. The statute sets forth the information to be on the application, including the application fee and insurance coverage. Each license must be renewed annually. A person who owns cloud seeding equipment, but who does not want a license must nevertheless register with the board. A published notice of intention will include the name and address of the licensee, the nature and object of the intended operation, and the area and time where the operation will be conducted. These provisions do not have to be compiled with if there is an emergency such as the need to extinguish fires. The county commission may also request such action to relieve a drought. A violation of this statute is a misdemeanor, and any pilot who wrongfully partakes in such a project may lose his license for five years. (Sperling-Florida)

WHEELING CREEK WATERSHED PROTECTION AND FLOOD PREVENTION DISTRICT COMPACT.
Pa. Stat. Ann., secs. 819.1-819.3 (1967).

Descriptors: *Pennsylvania, *Interstate compact, *Legislation, *Flood control, *Water resources development, Flood prevention, Water planning, Water development, Water management, Water policy, Interstate rivers, Cooperation, Coordination, State governments, Water rights, Watersheds, Water conservation, Wildlife conservation, Recreation, Reservoirs, Dams, Fishlife, Agricultural conservation, Administrative agencies.

The Wheeling Creek Watershed Protection and Flood Protection District Compact is created. The Compact in turn establishes a district to carry out the intent and purposes of the Compact. The district has the responsibility of planning and implementing improvements for flood control and flood prevention within its jurisdiction as well as applying for federal funds and other assistance in carrying out plans for works and improvements. It shall also be the purpose of the act that the district engage in public fish and wildlife conservation and recreational development, including the operation and construction of all necessary facilities. Furthermore, the Compact authorize the operation and maintenance of reservoirs and dams, and the allocation and control of all phases of agricultural conservation in cooperation with the United States Department of Agriculture. The district shall assure landowners and water users such water rights as they have acquired, as well as cooperating with soil conservation districts and all other state, local and federal agencies in promoting the most efficient methods of carrying out the purposes of the Compact. ARCTIC PASSAGE--LEGAL HEAVY WEATHER,
D. E. Milsten.
Orbis, Vol 15, No 4, p 1173-1193, Winter 1972.

Descriptors: *Arctic, *Arctic Ocean, *Natural resources, *Water resources development, *Legal aspects, Water law, Polar regions, Boundary disputes, Water rights, Boundaries, Navigable waters, Developed waters, International law, International commissions, International waters, Commercial fishing, Water quality, Water pollution control, Mineralogy, Land development.

With the successful navigation of the Arctic ice pack through the Northwest Passage by the specially equipped icebreaking oil tanker, S.S. Manhattan, the prospect of considerable public and private development has again risen. A vast wealth of minerals is known to exist in the Arctic. Competition in the development of these resources raises the potential for political challenge between the nations interested in Arctic development and the use of the common resource---the ocean. Of major concern is the use of certain waterways as access routes for rapidly expanding developmental situations. Also, the ocean areas themselves are subject to development efforts, as seen in the growing importance of continental shelf resources and fishing. The question of pollution in the seas is a growing concern for many nations. In 1970 Canada enacted two measures which extended its territorial waters to twelve miles and asserted control over Arctic waters up to 100 miles from the mainland for the purpose of preventing oil pollution, while establishing standards of performance for vessels transiting Arctic waters. Disputes over sovereignty and international law will have to be resolved before Arctic development can be realized. (Silber-Florida)
W74-09139

A BILL TO CREATE A MARINE RESOURCES CONSERVATION AND DEVELOPMENT FUND; TO PROVIDE FOR THE DISTRIBUTION OF REVENUES FROM OUTER CONTINENTAL SHELF LANDS; AND FOR OTHER PURPOSES.
Senate Bill 2672, 93d Cong, 1st Sess (1973). 8 p.

Descriptors: *Federal government, *Legislation, *Coasts, *Natural resources, *Continental shelf, *Conservation, Marine fisheries, Oceans, Water pollution, Water pollution control, Government

finance, Aquaculture, Erosion, Shores, Shore protection, Recreation, Flood protection, Oceanography, Regional development, Research and development, Mineralogy, Exploration.
Identifiers: *Marine Resources Conservation and Development Act, *Outer Continental Shelf Lands Act.

This bill would amend the Outer Continental Shelf Lands Act. All rentals, royalties or other sums paid in connection with any lease on the Outer Continental Shelf which is attributable to that portion of the Outer Continental Shelf adjacent to any state or that portion to which a state by interstate compact has limited itself shall be deposited as follows: 70% in a special fund to be known as the Marine Resources Conservation and Development Fund (MRCDF); and 30% to the adjacent states to be used for conservation purposes, including the prevention and abatement of environmental pollution in the coastal areas of the state. The MRCDF shall be available for marine resources conservation and development programs for fresh and salt water pollution control, fresh and salt water aquaculture, prevention of beach and shoreline erosion, hurricane and flood prevention, aid to sea grant colleges, fishery development, recreational facilities and oceanographic research and development. The MRCDF shall also be used to establish Regional Environmental Review Boards to inspect the exploration, production and transportation of minerals off the coast of their respective regions. (Ritchie-Florida)
W74-09140

INDUSTRIES WIN FEW CONCESSIONS AS POLLUTION PERMIT PLAN MOVES ON SCHEDULE,
J. R. Wagner.
National Journal, Vol 3, p 932-938, May 1, 1971.

Descriptors: *Water law, *Permits, *Water quality control, *Water pollution control, *Industrial waste disposal, Regulations, Wastewater disposal, Legal aspects, Water pollution sources, Water policy, Environmental sanitation, Navigable waters, Federal government, Standards, Administrative agencies, Impaired water quality, Sewage disposal, Water permits, Water utilization, Planning, Water resources development, Water management, Governments, Water treatment, Pollution abatement.

The Environmental Protection Agency and the Army Corps of Engineers are enforcing the July 1, 1971 date as the deadline for all industries discharging waste into navigable waters to apply for federal permits to continue their discharges, even though the affected industries do not have all the regulations necessary to fully comply. Without more legislation (Refuse Act) agency officials claim full authority to launch the permit program and to enforce it. If polluting industries fail to comply with the program's requirements, they can expect court action. The new regulations appear to have been written so as to withstand possible legal challenges to the permit program. Fish and wildlife protection are given special emphasis and attention. Vessels will not be required to apply for permits. Municipal systems of liquid waste discharge are not included within the 1899 Refuse Act, but industries are liable for criminal sanctions if they attempt to discharge their wastes through municipal sewage systems. Effluent guidelines appear to be the most important of the regulations as they define the degree of pollution allowed to industries in the major categories. (Silber-Florida)

WATERCRAFT: MARINE TOILETS.
Mo. Stat. Ann., tit. 19, sec. 306.260 (1972).

Descriptors: *Missouri, *Legislation, *Sewage, *Sewage disposal, Sewage treatment, Septic tanks, Sewage lagoons, Water pollution, Water pollution sources, Water quality, Mississippi River, Missouri River, Boats, Equipment.
Identifiers: *Interstate commerce, Marine toilets.

All marine toilets on any boat, operated upon the waters of Missouri, shall be so constructed and operated as to contain all sewage aboard the boat, and not to discharge any sewage into the waters directly or indirectly. All sewage when removed from any boat shall immediately be placed in an approved septic tank, sanitary lagoon or sewage treatment system. This statute does not apply to boats engaged in interstate commerce on the Missouri and Mississippi rivers. (Ritchie-Florida)
W74-09143

LITTLE CALUMET RIVER FLOOD CONTROL COORDINATING COMMISSION.
Ill. Pub. Acts 1973, ch. 78-782, sec 1, to be codified as Ill. Stat., ch. 19, sec 112.11 to 112.17.

Descriptors: *Legislation, *Rivers, *Flood control, Flood protection, Streamflow.
Identifiers: *Flood Control Act.

The Little Calumet River Flood Control Coordinating Commission is created. The commission shall examine and study all existing and future plans and policies in relation to flood control in and along the Little Calumet River and its tributaries. The commission shall coordinate the various programs of federal and state agencies involving flood control in and along the river and its tributaries, excluding control of funds for dredging, diking, channelization or other such flood control measures. The commission shall report findings, conclusions and recommendations, including drafts of suggested legislation to the General Assembly no later than March 1 of each year. The commission may employ and fix the compensation of such staff as it considers necessary and desirable. (Silber-Florida)

LANGFORD V. KRAFT, DOWNING AND WOOTEN ENTERPRISES V. KRAFT (DAMAGE FROM FLOOD RUNOFF).
498 S.W.2d, 42-52 (Texas 1973).

Descriptors: *Flooding, *Surface runoff, *Storm runoff, Water control, Drainage system, Natural flow, Diversion, Texas.

An action was taken by an adjoining landowner against real estate developers and their engineer for damages and for an injunction with respect to the flooding of the owner's land by discharge from the storm sewer system. The district court issued a temporary injunction and the engineer appealed from the ruling. The court of appeals held the trial court did not abuse its discretion in granting the temporary injunction, that the action against the engineer was properly maintainable in the county in which the alleged trespass occurred and that the statute pertaining to venue of ordinary injunction suits was not applicable. The court held that the developer's actions causing water runoff to adjoining land caused damage in violation of a statute prohibiting diversion or impounding of natural flow of surface waters in a manner that damages the property of another. Once the violation is shown, the doctrine of balancing of equities is inapplicable in determination whether to grant an injunction. (Daniels-Florida)

OVER 40 YEARS OF REGIONAL SERVICES,
Hartford Metropolitan District, Water Bureau, Conn.
G. Gufstafson, and H. Phillips.
Journal of American Water Works, Vol 65, No 4, p 243-247, April 1973. 4 p, 4 fig, 3 photo, 1 ref.

Descriptors: *Connecticut, *Water districts, *Water distribution(Applied), *Water supply, *Filtration, Reservoirs, Recreation facilities.

The water district which serves Hartford County, County is described. The district is a municipal corporation formed in 1930. The district supplies water to about 400,000 people within the twenty mile radius provided for in its charter and also collects and treats sewage for the area. It has four pollution control plants which utilize the activated-sludge process. There are six active water-supply reservoirs within the district and also a compensating reservoir with a capacity of three billion gallons. The compensating reservoir has never been used as a water supply reservoir. It was originally built to compensate well owners during periods of low flow, but now it also serves as a recreational area for swimmers, boaters, and fishermen. Although the district's raw water is low in turbidity and color, the district decided long ago to adopt filtration to ensure the safest and clearest water possible. The slow sand process is used in the older facilities but the new plants have gone to the rapid sand process due to its ease of automation, reduced space requirements, and lower construction costs. (McKnight-Florida)

EFFECTS OF PENDING FEDERAL DRINKING-WATER LEGISLATION,
C. Atkinson, Jr.
Journal of American Water Works Association, Vol 65, No 9, p 579-581, September 1973. 1 photo.

Descriptors: *Potable water, *Legislation, *Standards, Utilities, Industries, Water quality control, Water quality standards.

Changes in drinking-water standards and what these changes are going to mean to the water utility industry are discussed. A public affairs committee was established with the prime purpose to see that officers and members of the American Water Works Association are informed on matters affecting water and related subjects. All bills now before Congress provide for greater supervision and control of drinking water than in the past. The bills provide that the federal government is to conduct and promote research, technical assistance and training of water-supply personnel. The conclusion reached by the committee is that the proposed safe-drinking-water legislation will, if passed, have far-reaching effects on state and local programs and on the water industry. (Daniels-Florida)

WATER IMPROVEMENT COMMISSION.
Me. Rev. Stat. Ann., Vol 16, tit 38, secs 361-367 (Supp. 1973).

Descriptors: *Maine, *Legislation, *Water pollution control, *Environmental control, Sewage, Wastes, Industrial wastes, Tidal waters, Water quality standards, Inter-agency cooperation.

Maine's Board of Environmental Protection was established to represent manufacturing interests, the public generally and conservation interests. It will exercise the police power of the State to control, abate and prevent the pollution of the air, waters, coastal flats and provide for the best use of the natural resources of the State of Maine. The Board shall consult and advise municipal authorities on sewage and industrial wastes; make such regulations as are reasonably necessary; conduct hearings and establish a continuous planning process in cooperation with state, federal and regional agencies consistent with the Federal Water Pollution Control Act. It shall establish standards for fresh, tidal and marine water protection. (Daniels-Florida)
W74-09148

PROTECTION AND IMPROVEMENT OF WATERS.
Me. Rev. Stat. Ann., Ch. 16, Tit. 38, Sec. 451-454 (Supp. 1973).

Descriptors: *Maine, *Water quality control, *Legislation, Navigable waters, Surface water, Law enforcement, Water quality standards.
Identifiers: Enforcement.

This is the enforcement provision of the waters and navigation laws of the state of Maine. The Statute provides that after adoption of any classification by the legislature for surface waters, it is unlawful for any person or firm to dispose of sewage or any industrial waste in such manner as will after diffusion and mixture with the receiving waters lower the quality of said waters below the minimum requirements. The purpose of these mixing zones is to allow a reasonable opportunity for dilution, diffusion or mixture of wastes with the receiving waters before the receiving waters below or surrounding a discharge will be tested for classification violations. Where no mixing zones have been established it shall be unlawful for any person or firm to dispose wastes into any classified waters that will lower the quality of waters below the minimum standards, notwithstanding any licenses which may have been granted or issued. Provisions for revocation, modification or suspension of licenses for mixing zones are included within this enforcement section. (Daniels-Florida)
W74-09149

NATURAL AND SCENIC RIVERS SYSTEM.
N.C. Gen. Stat., secs. 113A-30 through 113A-43 (1971).

Descriptors: *North Carolina, *Scenic easements, *Aesthetics, *River systems, Wild rivers, Administrative agencies, Boundaries(Property), River flow, Social aspects, Economic aspects, Land management.

North Carolina has adopted a policy aimed at the retention of natural and senic conditions in the state's rivers. This is to be accomplished by maintaining them in a free-flowing state and protecting their water quality. For inclusion into the natural and scenic river system the river or river segment must meet the following criteria: the length must be greater than one mile; the boundaries on the shoreline must not be less than twenty feet nor more than 320 acres (except by donation) of land per mile; water quality must be essentially unpolluted at present; the water flow shall be sufficient to assure a continuous flow, and not be subject to withdrawal or regulation that would substantially alter the natural ecology of the stream; and, public access must be limited in keeping with the purpose of this statute. The administration of the statute is the responsibility of the Department of Conservation and Development. The Department also has authority to plan, develop, and acquire land. It can either acquire complete ownership of the land or scenic easements thereon. Anyone who donates land or an easement is entitled to a charitable deduction under North Carolina law. (Sperling-Florida)
W74-09150

WHAT CONSTITUTES PUBLIC WATERWAYS AND RIGHTS.
Miss. Code Ann., sec. 51-1-4 (Supp. 1973).

Descriptors: *Mississippi, *Water rights, *Water policy, Navigable waters, Riparian rights, Public rights, Recreation, Channels, Water zoning, Water allocation(Policy).
Identifiers: Navigability tests.

Criteria are established as to what constitutes public waterways and the subsequent rights thereon. Such portions of all natural flowing streams having a length of not less than five miles and an average depth along the thread of the channel of three feet for ninety consecutive days in the year and an average width at low water of not less than thirty feet, shall be public waterways of the state of Mississippi on which citizens of this state or any other state shall have the right of free transport and the right to fish and engage in water sports. Except as otherwise provided by law nothing herein contained shall authorize any person, firm or corporation utilizing said public waterways to disturb the banks or beds of such waterways or discharge any object or substance into such waters or upon or across the lands adjacent thereto. This section shall not be construed to prohibit the construction of dams or reservoirs in the manner authorized by law, or to amend or repeal any law relating to pollution or water conservation. This section does not apply to manmade waterways. (Silber-Florida)
W74-09151

DREDGING OF OYSTER SHELLS FROM PUBLIC LAND UNDER CHESAPEAKE BAY AND POTOMAC RIVER.
Ann. Cd. of Md., art. 66C, sec. 13B (1970).

Descriptors: *Maryland, *Legislation, *Administrative agency, *Dredging, Navigable waters, Public lands, Decision making, Tidal waters.
Identifiers: Coastal zone management.

A permit is required to remove sand, gravel, or any other resources from the public lands under navigable waters of the Chesapeake Bay and the Potomac River. In the application for the permit, the location of the land where the resources are to be taken should be noted. Required survey stakes should be driven, where possible, at definite corners of the tract. The application for the permit must be accompanied by a ten dollar fee. Persons who dredge oyster shells from the public lands under the navigable waters of the aforementioned bodies of water must leave approximately one hundred feet of bottom untouched for every one thousand feet dredged. These untouched strips will be maintained and it will be unlawful for any person to destroy or damage them by dredging or other means. (Sperling-Florida)
W74-09152

CONSERVATION AND LAND DEVELOPMENT.
Pa. Stat. Ann., secs. 5001-5013, p 48-51 (1967).

Descriptors: *Pennsylvania, *Legislation, *Water management, *Conservation(Natural resources), *Land management, Land development, Erosion control, Streams, Beaches, Shores, Recreation, Wildlife, Forests, Land use, Watershed protection, Flood plains, Marshes, Groundwater, Administrative agencies.

Pennsylvania's Open Space Lands policy is established. It is the legislative intent and purpose to clarify and broaden the existing methods in which land may be preserved or acquired for open space uses. The state finds that it is an essential policy to meet the needs for recreation, amenity and conservation of natural resources, including farm lands, forests and a pure and adequate water supply. The Department of Forests and Waters is authorized to acquire interests in or purchase real property to protect and conserve water resources and watersheds, forests and timberlands, and to protect existing or planned park, forest, wildlife preserve or other recreation and conservation sites by controlling the use of contiguous or nearby lands in order to protect the senic, aesthetic or watershed values of the sites. The Department is also charged with the responsibility of protecting and conserving the soils, beaches, streams, flood plains and marshes of the state and protecting and enhancing their scenic, historic, geologic, and botanic importance. (Silber-Florida)
W74-09153

2 OBJECTIVES 4 ACCOUNTS,
Water Resources Council, Washington, D.C.
W. D. Fairchild.
Water Spectrum, Vol 5, No 4, p 22-27, 1973. 4 photo, 1 chart.

Descriptors: *Planning, *Water resources development, *Water policy, *Water supply, Inter-agency cooperation, Multi-purpose projects, Political aspects, Social function.
Identifiers: Water Resources Council.

The revised Principles and Standards for water planning, issued by the U.S. Water Resources Council are discussed. The main objective was to place environmental concerns on an equal basis with economic development. By considering national economic development, environmental quality, regional development and social well being, an opportunity to fully evaluate projected effects and tradeoffs of alternate plans is provided for. The Principles and Standards reflect that the country's values are changing. Under the new principles, the public's role will be stimulated, as plan formulation will require public participation to be sought early and continually throughout the process. Implementation of the Principles and Standards will push progress towards defining positive ways of identifying effects in a descriptive way. No comment is given on cost considerations as changes in such provisions will be through legislative actions. (Sutton-Florida)
W74-09154

DIVERSION OF WATER.
S.C. Code Ann., sec. 59-16 (1970).

Descriptors: *South Carolina, *Water law, Rivers, Bays, Diversion, Routing, Diversion structures, Consumptive use, Structures, Canals, Conduits, Ditches, Electric powerplants.

The South Carolina Public Service Authority is authorized to divert water from the Sampit River, Penny Royal Creek and their tributaries for use in connection with the operation of an electric generating plant to be constructed between the Sampit River, Penny Royal Creek and Winyah Bay and to discharge such water, or so much thereof as is not consumed into Winyah Bay. Such diversion shall not exceed two thousand cubic feet of water per second each day, and may be accomplished by canals, conduits, ditches, pipes or other proper structures. This provision shall not be construed to waive the laws as to pollution control, and shall not affect the right of any person to recover damages sustained as a result of the diversion of water permitted by this section. (Ritchie-Florida)
W74-09155

PUBLIC WATER SUPPLY, SEWERAGE AND SOLID WASTE DISPOSAL SYSTEM.
Md. Code Ann., art. 43, sec. 387C (Supp. 1973).

Descriptors: *Maryland, *Administrative agencies, *Adoption of practices, *Coordination, Water conveyance, Waste water disposal, Solid waste.

A county plan for the public water supply, sewerage, and solid waste disposal systems will delineate those areas where community water supply systems must be provided and where individual water supply systems may be installed and used in the interim although in some areas individual water supply systems may be installed and used for an indefinite period. Each plan will also show where community sewerage systems must be provided as well as where individual systems can be used. Adequate sewage treatment facilities are required to prevent the discharge of inadequately or untreated sewage or other liquid waste into any waters. In addition every county plan will establish procedures for acquiring necessary rights-of-way or easements for the community water supply, or sewerage and waste acceptance and disposal systems. A time schedule and proposed methods of financing the construction and operation, as well as the estimated cost of each system are to be included in the plan. Each county plan must indicate the source of the water

supply, the amount withdrawn from waters of the state of Maryland, and the quantity and quality of wastes to be discharged into the waters of the state. (Sperling-Florida)
W74-09156

COUNTY SEDIMENT CONTROL PROGRAMS.
S.C. Code Ann., secs. 63-195.101 through 63-195.106 (1971).

Descriptors: *South Carolina, *Legislation, Erosion, Siltation, Sedimentation, Sediment control, Soil conservation, Soil erosion.

Any county in South Carolina may establish a sediment control program upon adoption of a resolution by the body authorized to levy taxes within the county, and shall then designate the proper agency to administer and enforce the program. In counties establishing such a program, no minerals shall be commercially mined nor shall ground be broken for construction until a grading permit is obtained. Plans which will outline methods to control erosion and siltation must be submitted and approved prior to obtaining a permit. Construction of single-family residential dwellings and agricultural buildings is exempted from the above provision. Fines may be imposed for violation of the above provisions and the soil and water conservation districts and the governing body of each county are empowered to obtain injunctive relief for violations of any grading plan previously submitted. (Ritchie-Florida)
W74-09157

POLLUTION CONTROL FACILITIES.
S.C. Code Ann., secs. 63-195.51 through 63-195.65 (1971).

Descriptors: *Air pollution, *South Carolina, *Pollution abatement, Financing, Taxes, Waste disposal, Industrial wastes, Cities.

South Carolina has enacted statutes governing the financing and letting of contracts for construction of pollution control facilities, which are any facilities designed for the elimination, mitigation or prevention of air or water pollution. The facilities include all things which are required to collect, treat and thereafter dispose of all waste of any sort originating in or about any industrial enterprise. Prior to undertaking the financing of any pollution control facility, a finding is required by the Pollution Control Authority of South Carolina that the pollution control facilities are necessary and that the design will result in the elimination, mitigation and prevention of air or water pollution. Counties and municipalities are empowered to enter into agreements with any industry to construct and thereafter operate, maintain and improve pollution control facilities, to enter into loan agreements with such industry and to issue tax exempt bonds to defray the cost of constructing or enlarging any pollution control facilities. (Ritchie-Florida)
W74-09158

WATER CONSERVATION.
La. Rev. Stat. secs. 38:2552 thru 38:2907 (Supp. 1973).

Descriptors: *Louisiana, *Sewage disposal, *Water districts, Soil conservation, Land use, Recreation facilities.

The Bayou D'Arbonne Lake Watershed District shall be a political subdivision of the state of Louisiana and shall have as its purpose the conservation of soil and water, and the development of the natural resources and wealth of the district for sanitary, agricultural and recreational purposes. The Bossier Parish police jury is authorized to regulate and control the types of private sewage disposal systems or other private facilities that may discharge pollutants into the waters within the Cypress-Black Bayou Watershed. Other statutes are suspended insofar as they limit the size of park and recreational facilities authorized for erection and construction by the Board of Commissioners of the Black Bayou Watershed District. The Board is urged to take steps necessary to take advantage of federal financial assistance that is or may become available. The Jackson Parish Watershed District shall have for its purpose the conservation of soil and water and the development of the natural resources and wealth of the district. The district shall have all the powers, rights, privileges and immunities of a public corporation. (Napolitano-Florida)
W74-09159

RED RIVER WATERWAY.
La. Const. Art. 14 sec 30.5 (Supp. 1973).

Descriptors: *Louisiana, *Navigable rivers, *Governmental interrelations, Easements, Right-of-way, Land use, Capital costs, Tax rates, Bonds, Leases, Water districts.
Identifiers: Red River, Atchafalaya River.

The Louisiana Constitution creates the Red River Waterway extending from the vicinity of the confluence of Red River with Old River and the Atchafalaya River northwestward in the Red River Valley to the state boundary. This navigable waterway system is created for the purpose of establishing, operating, and maintaining cooperation with the federal government. The state legislature is empowered to create the Red River Waterways District which shall be the body politic. The legislature shall prescribe the jurisdiction, objects, purposes, power and authority of the district. In addition to other powers which the legislature may confer upon it, the district governing body shall be authorized: to levy an annual tax not to exceed 1.5 miles on all taxable property within the district for purposes of capital outlay including cost of acquisition of rights-of-way and compensation; to fund bonds for the accomplishment of capital outlay; to expropriate property; to acquire by purchase, donation, lease or otherwise, and to hold and use any property real, personal or mixed, tangible or intangible, or any interest therein necessary or desirable for carrying out the objects and purposes of the district; and to create and establish port sub-districts within the confines of the district. (Napolitano-Florida)
W74-09160

HAYES V. STATE (FENCING ON NAVIGABLE WATERS).
496 S.W. 2d 372-375 (Ark. 1973). 4 p.

Descriptors: *High water mark, *Riparian rights, *Navigable rivers, River beds, Judicial decisions, Arkansas, Riparian land, Ownership of beds, Boundaries(Property).

The case involved the defendants', riparian land owners, right to erect a fence. The defendants' right was dependent on two determinations, one being whether the river was navigable at that point and the other being the location of the ordinary high water mark. The Supreme Court of Arkansas affirmed the finding that the river was navigable but reversed the order concerning the ordinary high water mark. The Court said that high water mark was to be determined by examining the bed and banks to ascertain where the presence of the water was so usual and continued as to mark upon the beds a character distinct from the bank in respect to vegetation and the nature of the soil itself. This reversal allowed the defendants to maintain their fence. (Sears-Florida)
W74-09161

NEW ENGLAND INTERSTATE WATER POLLUTION CONTROL COMMISSION.
R.I. Gen. Laws Ann., secs. 46-16-1 through 46-16-1.3 (Supp. 1972).

Descriptors: *Legislation, *Rhode Island, *Interstate compacts, *Interagency cooperation, Water pollution abatement, Cooperation.

The state of Rhode Island is authorized to reaffirm its support and participation in the cooperative approach to the abatement and control of water pollution as embodied in the New England interstate water pollution control compact. The New England interstate water pollution control commission shall develop programs in view of increasing population concentrations, the growing needs of industry and agriculture for water of reasonable quality, and the quality requirements of water-based recreation and other uses. The commission shall also develop and maintain programs and research on water quality problems. The commission may employ those personnel necessary to carry out its functions, including engineering, technical and professional specialists. (Silber-Florida)
W74-09163

WHO OWNS THE WATER,
J. McCall.
Environment, Vol 12, p 31-39, October 1970. 4 photo.

Descriptors: *Water pollution control, *Water quality control, *International commissions, *U.S. legislation(National and State), International joint commission, Water quality standards, Federal Water Pollution Control Act, Sewage disposal, Environmental sanitation, Sewage bacteria, Administrative agencies.

An analysis of water pollution in the world's rivers is divided into a consideration of international measures for water quality control, U.S. measures, and measures employed by other countries. Efforts to improve water quality in the rivers of Europe indicate a failure to place the realization of water pollution above political considerations. The United Nations and the World Health Organization in conjunction with the efforts of the nations themselves have done little more than declare water policy. This seems unsatisfactory in that policy remains useless without means of implementation and methods of enforcement. In general then, international activity seems insufficient to control pollution. On the national level in the United States, development of state agencies and water commissions are evidence of an effort to grant authority to establish water management programs with broad controls. Notwithstanding the effects of political necessity, chances for improvement appear greater in this approach than in international cooperation. Other nations of the world have developed patterns of attack similar to that of the United States. Problems throughout the world remain in the area of sewage treatment. Treatment processes must be refined in order to decrease water pollutants. (Proctor-Florida)
W74-09164

COUNTY SANITATION FACILITIES INSPECTION.
Tenn. Code Ann., secs. 5-1913 through 5-1916 (1969).

Descriptors: *Environmental sanitation, *Waste water disposal, *Environmental engineering, Tennessee, Sewage treatment, Local governments, Public health, Sewage disposal.

Procedures are defined for inspections of county sanitation and disposal facilities. The county sanitarian and commissioner of public health are permitted to inspect these facilities at their own initiative, however they must do so at least quarterly. The county sanitarian and the commissioner can give technical advice and assistance to local officials for the betterment of their refuse disposal practices. It is also realized that existing rights are not to be lessened by the addition of these statutes. However, a restriction is placed on an individual's

right to dispose of solid wastes on his own property, but only if such disposal will create a public nuisance or hazard to the public health. (Sutton-Florida)
W74-09165

INTERSTATE ENVIRONMENTAL COMPACT.
Tenn. Code Ann., sec. 53-5001 (1972).

Descriptors: *Legislation, *Tennessee, *Interagency cooperation, *Interstate compacts, Comprehensive planning, Interstate commissions, Governmental interrelations.

The state of Tennessee is authorized to enter with all other jurisdictions legally joining the interstate environmental compact. The compact was established to promote intergovernmental cooperation with environmental pollution problems that transcend state boundaries. The compact was also designed to avoid duplicate efforts by many individual agencies dealing with similar problems among the separate states. The state is authorized to execute supplementary agreements provided that the governor and legislature approve of the action to be taken. Nothing within this act shall be construed as invalidating any provision of law of any signatory, nor shall it modify or qualify the authority of any signatory to enact or enforce environmental protection legislation within its jurisdiction and not inconsistent with any provision of the compact. (Silber-Florida)
W74-09166

AUTHORITY TO LEASE SEA BOTTOM.
Miss. Code Ann., sec. 49-15-27 (1972).

Descriptors: *Mississippi, *Leases, *Legislation, *Water resources development, Sea water, Oceans, Administrative agencies, Riparian rights, Ports, Harbors, Channels, Recreation, Beaches, Shores, Marine life.

The Mississippi state commission created herein is authorized to lease sea bottoms within its jurisdiction providing the area is not now or hereafter designated as a tonging reef or natural reef or the area is not within the boundaries of riparian property owners. All individual lessees shall be residents of the state corporations organized under the laws of the state. No person may lease less than five acres nor more than one hundred acres, and any firm which holds or controls or attempts to hold or control by any device, more than two hundred acres of water bottom shall forfeit the leases so held by it. All leases shall be subject to the paramount right of the state and its subdivisions to promote and develop ports, harbors, channels, industrial or recreational projects. Such leases shall be awarded under such conditions as will insure the maximum culture and propagation of oysters. (Silber-Florida)
W74-09168

SOIL AND WATER CONSERVATION.
Pa. Stat. Ann., secs. 849-862, p 85-92 (1972).

Descriptors: *Pennsylvania, *Legislation, Erosion control, Agriculture, Dams, Reservoirs, Navigable waters, Harbors, Flood control, Drainage, Land use, Wildlife, Watersheds, Soil erosion.

The Soil and Water Conservation policy of the state of Pennsylvania is established as to all matters, concerns, and aspects of agriculture. The purposes of the law are to provide for the conservation of the soil, water and related resources of the state; control and prevent soil erosion, thereby preserving natural resources; assist in flood control; prevent impairment to dams and reservoirs; maintain the navigability of rivers and harbors; preserve wildlife; and protect public lands. The act creates the State Conservation Commission whose responsibility it is to offer assistance to conservation districts, to approve and coordinate joint programs among the several districts, to aid in land and water management and conservation of related natural resources and to approve projects and recommend priorities for planning for watershed management and development. The commission shall also have financial and contract powers as well as the authority to establish conservation districts when the public interest necessitates such action. (Silber-Florida)
W74-09169

MARINE RESOURCES COUNCIL.
Miss. Code Ann., secs. 57-15-5 through 57-15-7 (1972).

Descriptors: *Mississippi, *Legislation, *Administrative agencies, *Marine biology, *Water resources development, Coasts, Sea water, Aquatic life, Marine geology, Beds, Coastal plains, Shores, Beaches.
Identifiers: Marine Resources Council(Miss).

The Marine Resources Council is created to study, plan, report, make proposals and recommendations for the development and utilization of the coastal and offshore lands, waters and marine resources of the state, and to insure that all future plans and programs involving said marine resources will be coordinated with comparable agencies of the United States. The Council shall have as its aim to provide for effective, efficient and economic development of marine resources available to the state, and to cause suitable skilled professionals and labor to harness the marine resources of the state's coastal, offshore and water resources toward achieving the highest economic growth potential possible in the oceanographic field and scientific discovery of underwater marine resources. The Council shall cause to be carried out the continuing study of the science of oceanography and the development of a long-range oceanographic program for the State of Mississippi. (Silber-Florida)

ENVIRONMENTAL IMPACT ANALYSIS: A REVIEW OF THREE METHODOLOGIES,
Wisconsin Univ., Madison. Inst. for Environmental Studies.
M. L. Warner, and D. W. Bromley.
Available from the National Technical Information Service as PB-232 947 $3.75 in paper copy. $1.45 in microfiche. Wisconsin Water Resources Center, Madison, Technical Report, 1974. 69 p, 5 figs, 6 tables, 125 refs. OWRR B-057-WIS (3), 14-31-0001-3354.

Descriptors: Resources, Economics, *Environmental effects, *Decision making, *Testing procedures, *Water quality control, *Water Quality standards, *Idaho, Methodology, Evaluation, Reviews.
Identifiers: *Environmental impact.

The National Environmental Policy Act of 1969 (NEPA) required the filing of environmental impact statements by Federal agencies proposing major actions significantly affecting the quality of the human environment. This research suggests bases for the evaluation and further development of methodologies used to prepare impact statements. Three methodologies are critically analyzed. They are: the 'Lepold approach,' suggested by Luna B. Leopold, et. al. (1971), the 'Battelle approach,' developed at Battelle's Columbus Laboratories for the U.S. Bureau of Reclamation (Dee, et. al, 1972), and the 'WRC approach,' contained in the 'Principles and Standards for Planning Water and Related Land Resources' of the U.S. Water Resources Council (1973). Specific criteria for methodology evalua-

tion are developed within the areas of: technical ecological content, practical applicability, and political utility. These criteria are designed to emphasize a 'full-disclosure law' interpretation of NEPA. The methodologies are examined using each set of criteria in turn. To provide a more concrete setting for this analysis, a test case involving a proposed U.S. Bureau of Reclamation water resources development project in Southwest Idaho was used. Data collection consisted of a point-by-point comparison of criteria and related desirable characteristics to each methodology. These data are analyzed for overall methodological conformance to the criteria to yield conclusions on the strengths and weakness of the methodologies.

Descriptors: *Education, *Environmental engineering, Universities, Training, Colleges, *Vermont.
Identifiers: Course of study, *Norwich University(Vermont).

The new and innovative 4 yr curriculum in Environmental Engineering Technology at Norwich University, Northfield Vermont, is described. The objective of the program is to produce an environmental technologist who has the technical competence to work with environmental engineers and support environmental activities with minimum supervision. The course of study includes the following environmental courses: Environmental Pollution, Air Resource Engineering, Hydrology and Water Resources, Water Analysis Instruments, Air Sampling and Monitoring, Water Pollution Control, Air Analysis Instruments, Air Field Lab Problems, and Water Field Lab Problems. The predominant characteristic of the technologist who will graduate from this program will be the technical ability to identify and define the extent of environmental pollution or establish that no pollution exists. In: Cycling and Control of Metals; Proceedings of Environmental Resources Conference, October 31-November 2, 1972, Columbus, Ohio: Environmental Protection Agency National Environmental Research Center, p 159-165, February 1973. 9 fig, 12 ref.

Descriptors: *Monitoring, *Water pollution, *Air pollution, Networks, Network design, Systems analysis.

Monitoring networks yield vast amounts of raw data which must be transformed into usable information by a filtering process which generally involves a complex transfer function. Monitoring systems exist in support of the decision making process for recommending actions. This process feeds on information not data. A systems approach can be used in designing these networks. A JEEP-MOUNTED RAINFALL SIMULATING INFILTROMETER,
Northern Arizona Univ., Flagstaff.
W. R. Henkle.
In: Hydrology and Water Resources in Arizona and the Southwest, Proc. of the 1973 meetings of the Arizona Section-AWRA and the Hydrology Section-Arizona Academy of Science, May 4-5, 1973, Tucson, Arizona, p 107-111, (1973). 2 fig, 4 ref.

Descriptors: *Infiltrometer, *Raindrops, *Rainfall intensity, *Rainfall simulators, *On-site tests, Infiltration, Runoff, Rainfall, Flow rates, Flow measurement, *Arizona, Mechanical equipment.

An infiltrometer was designed to more closely simulate natural storm characteristics and still maintain sufficient portability to be used in various test sites in the field. In addition to portability, a relatively large test plot can be used over a relatively long duration. The instrument is designed to produce rainfall intensities of 2 to 6 inches per hour which are comparable to natural storm intensities found in northern Arizona. Capillary tubes produce water drops of equivalent kinetic energy at impact to natural raindrops. Errors due to lateral flow are minimized through peripheral wetting. Mounting the infiltrometer on a four-wheel drive vehicle allows nearly the portability of a hand carried unit with a greater water carrying capacity and allows the equipment to be large enough to test a representative plot. LIGHTING UP THE HAZE OF TURBIDITY MEASUREMENT.
Process Engineering, p 68-71, March, 1974. 4 fig, 1 tab.

Descriptors: *Turbidity, *Measurement, *Light, Light intensity, Optical properties, Instruments.
Identifiers: Turbidimeters, Nephelometers, Scattered light, Transmitted light.

The measurement of turbidity and turbidity measuring instruments which utilize optical methods and operate on several different principles are described. Some instruments operating on the reflected beam or scattering principles measure the scattering at 90 degrees and others measure low angle scattering up to 45 degrees. In some cases the ratio between the amount of transmitted light and of scattered light is measured. Measurement of the intensity of light transmitted through a liquid is known as turbidimetry and instruments operating on this principle are turbidimeters. Measurement of the intensity of scattered light is known as nephelometry and instruments using this principle are nephelometers, but instruments measuring the ratio of the transmitted and scattered light are also often known as turbidimeters. Diagrams of four different turbidimeters are presented and their operation is explained. (Merritt-FIRL)
W74-08912

TURBIDIMETERS MONITOR DUBAI FLOOD WATER.
The Oil and Gas Journal, Vol 72, No 15, p 68, April 15, 1974. 1 fig.

Descriptors: *Turbidity, *Measurement, Water quality, Treatment facilities, Waste water treatment, Equipment.
Identifiers: *Light scattering, *Turbidimeters, *Dubai, Arabian Gulf.

Turbidimeters utilizing a forward light scattering technique are monitoring water purity for waterflooding oil fields in the Arabian Gulf. The instruments use two modular subsystems, a transmitter and a converter. The transmitter is mounted in the process line and projects a beam of light through the process stream. The turbidimeters are insensitive to color and bubbles so produce accurate measurements of solids loading. Linear solid state detectors convert the varying intensity of the light scattered from the particulates into electrical signals. These signals are processed by the converter to produce an instantaneous computation and display of turbidity. (Merritt-FIRL)

FLUID SAMPLE ANALYSIS SYSTEM,
Durrum Development Corp., Palo Alto, Calif. (assignee)
E. L. Durrum, C. O. Forge, P. L. Y. Lee, and K. L. Mackinnon.
U.S. Patent 3,806,321. Official Gazette of the U.S. Patent Office, Vol 921, No 4, p 1577, April 23, 1974. 1 fig.

Descriptors: *Patents, *Liquids, *Analytical techniques, *Ion exchange, Separation techniques, Mixing, Pressure, Tubes.
Identifiers: Reagent, Eluent.

A fluid sample analysis system is described which is characterized by an ion exchange column which operates on a time basis. A reagent supply line under substantial positive pressure discharges reagent into the eluent of the ion exchange column for mixing reagent and eluent. There is a back pressure resistance to passage of fluid which is substantially matched to the back pressure resistance provided by the ion exchange column. The system is further characterized by means for mixing the eluent and reagent and by a tubular reaction coil. (Merritt-FIRL)

WATER RESOURCES DATA FOR GEORGIA, 1973.
Geological Survey, Doraville, Ga.
Data Report, 1974. 231 p, 4 fig, 4 tab, 7 ref.

Descriptors: *Hydrologic data, *Surface waters, *Georgia, Water quality, Streamflow, Gaging stations, *Data collections, Discharge(Water), Sampling, Solutes, Water temperature.

Water resources data for the 1973 water year for Georgia include records of streamflow or reservoir storage at gaging stations, partial-record stations, miscellaneous sites, and records of water-quality data on the chemical and physical characteristics of surface water as well as records for a few pertinent gaging and water-quality stations in bordering States. The base data collected at gaging stations consist of records of stage and measurements of discharge of streams or canals, and stage, surface area, and contents of lakes or reservoirs. (Knapp-USGS)

GEOTHERMAL DRILLING AND PRELIMINARY TEST OPERATIONS AT KIZILDERE, TURKEY,
Mineral Research and Exploration Inst., Ankara (Turkey). Technical data.
E. Durucan, and K. Olcenoglu.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1463-1466, 1973. 4 fig.

Descriptors: *Drilling, *Well casings, *Geothermal studies, Wells, Water temperature, Steam, Hydrothermal studies, Rotary drilling, Drilling equipment, Well screens.
Identifiers: *Geothermal power, *Turkey(Kizildere).

The drilling equipment utilized for steam boreholes in Turkey is described with reference to drilling mud used and cementing operations. The first geothermal well drilling for natural steam at Kizildere was started in 1968. From the first test well a mixture of steam and hot water was produced. Up to now, seven deep test wells have been completed. Six of them are in the first reservoir and the seventh one is in the second reservoir. Gradient wells are about 100 m in depth. These have been drilled to measure the value of geothermal gradients in the different places of the field. The deep test wells go down to the reservoir. They have been drilled for testing and also for production purposes. (See also W74-08973) (Knapp-USGS)
W74-09029

PRESENT STATE OF DRILLING AND REPAIRING OF GEOTHERMAL PRODUCTION WELLS IN JAPAN,
Teiseki Sakusei Kogyo Co. Ltd. (Japan).
K. Matsuo.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1467-1479, 1973. 9 fig, 1 tab.

Descriptors: *Drilling, *Well casings, *Geothermal studies, Wells, Water temperature, Steam, Hydrothermal studies, Rotary drilling, Drilling equipment, Well screens.
Identifiers: *Geothermal power, *Japan.

Japan is a prominently volcanic country with many hot springs and abundant geothermal resources. As a result of exploration during the past ten years, many geothermal wells were drilled, and geothermal electric power stations have been constructed in two areas of Matsukawa in the Iwate Prefecture and at Otake in Kyushu. The drilling of geothermal production wells is basically the same as that of petroleum and natural gas. The rigs and equipment used for the drilling operation are exactly the same as those used for petroleum and natural gas. However, in the actual drilling operation, there are some problems which are inherent in the drilling of geothermal wells. (See also W74-08973) (Knapp-USGS)
W74-09030

GEOTHERMAL DRILLING IN THE MATSUKAWA AREA,
Japan Metals and Chemicals Co. Ltd., Morioka.
Y. Nakajima.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1480-1484, 1973. 4 tab.

Descriptors: *Drilling, *Well casings, *Geothermal studies, Wells, Water temperature, Stream, Hydrothermal studies, Rotary drilling, Drilling equipment, Well screens.
Identifiers: *Geothermal power, *Japan(Matsukawa).

In the Matsukawa geothermal area of Japan 6 wildcat holes and 6 production holes of 325-1500 meters depth have been drilled. Most of the hot water and the steam of that area exist in the fractured zone lying near the boundary between the Yamatsuri formation and the Tamagawa welded tuff at about 1,000 meters. Therefore, further drilling is being carried out aiming at that zone. The wells are comparatively deep, rocks are hard, temperature is high, and mud escape occurs frequently. Different drilling rigs were used according to the depth of 500, 1,000 and 1,500 meters. Chromite mud comparatively stable at high temperature was used as the circulated fluid. Pure water was used in case of mud escape. (See also W74-08973) (Knapp-USGS)
W74-09031

CASING STRING DESIGN FOR GEOTHERMAL WELLS,
Ministry of Works, Wellington (New Zealand).
N. D. Dench.
In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1485-1496, 1973. 7 fig, 7 tab, 10 ref.

Descriptors: *Drilling, *Well casings, *Geothermal studies, Wells, Water temperature, Stream, Hydrothermal studies, Rotary drilling, Drilling equipment, Well screens.
Identifiers: *Geothermal power, New Zealand.

Drilling to depths exceeding 1600 feet was carried out in ten geothermal fields in the North Island of New Zealand. Measurements in the wells established the pattern of temperatures and pressures which occur throughout their depth and life and which are used in calculating the various loads imposed on the casings. Changes of temperature caused by drilling operations result in severe casing stresses, and sometimes in failure, particularly in axial compression. The ability of several types of casing joints to resist this loading was measured in laboratory tests, and enough results have been obtained to allow the designer to estimate accurately failure strengths for some joints, and to make the best choice for any particular service. By relating design loads to casing strengths for various conditions of stressing, a set of design factors has proved useful in assessing the adequacy of casing strings proposed for geothermal service. Downhole conditions and joint testing together with examples of casing designs are given. (See also W74-08973) (Knapp-USGS)
W74-09032

EFFECT OF SLOTTED LINEAR CASING ON GEOTHERMAL BORES,
Japan Metals and Chemicals Co. Ltd., Morioka. Geothermal Power Div.
K. Katagiri.

In: Proceedings of the United Nations Symposium on the Development and Utilization of Geothermal Resources, Pisa, Italy, Sept 22-Oct 1, 1970: Geothermics 1970, Special Issue 2, Vol 2, Part 2, p 1497-1501, 1973. 3 fig, 1 tab.

Descriptors: *Drilling, *Well casings, *Geothermal studies, Wells, Water temperature, Steam, Hydrothermal studies, Rotary drilling, Drilling equipment, Well screens.
Identifiers: *Geothermal power, Japan.

Since 1964, six steam wells for geothermal power have been drilled in the geothermal area in Matsukawa, Japan. In drilling these steam wells, slotted liners with 6 5/8 inch diameter or 7 inch diameter have been unconditionally adopted. In drilling the sixth well, however, further study of the geological sequence of the hydrothermal reservoir suggested that the geological sequence in Matsukawa geothermal area was strong enough for an open hole. Only two months after completion, blocking occurred inside the hydrothermal reservoir. The blocked part was repaired immediately, but the failure showed the necessity of the slotted liner casing. Discharge is now about 60 tons per hour. (See also W74-08973) (Knapp-USGS)

PROPOSED JETTY-HEAD REPAIR SECTIONS, HUMBOLDT BAY, CALIFORNIA,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
D. D. Davidson.
Available from NTIS, Springfield, Va. 22151, AD-756 212, Price $3.00 printed copy; $1.45 microfiche. Technical Report H-71-8, November 1971. 144 p, 31 plate, 60 photo, 12 ref.

Descriptors: *Coastal engineering, *Jetties, *California, Shore protection, Bays, Harbors.
Identifiers: *Humboldt Bay(Calif).

Tests were conducted on a 1:50-scale model of the north jetty at Humboldt Bay, Calif., to determine how economical and stable repair sections can be designed to stop deterioration caused by wave action. Design of a satisfactory repair section is made difficult because of the large waves and day-to-day sea conditions that prohibit the use of floating plant for construction, the limited lifting capacity and horizontal reach of available land-based construction equipment, and the necessity of placing the armor unit toe protection on the existing underwater rubble mound. The study included the investigation of (a) the waves that can attack the proposed structure, (b) the effects of stability of linking the armor units, and (c) the optimum shape of armor unit and repair section that would be stable for the selected design-wave conditions. (Knapp-USGS)
W74-09117

PROPOSED LONG DRAW RESERVOIR ENLARGEMENT PROJECT, COLORADO, AN APPLICATION UNDER THE SMALL RECLAMATION PROJECTS ACT (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Bureau of Reclamation, Denver, Colo.
Available from National Technical Information Service, U.S. Dept. of Commerce, Springfield, Va., as EIS-CO-73-0183-F. February 7, 1973. 147 p, 4 tab, 15 map, 2 chart.

Descriptors: Effects, *Reservoirs, *Legislation, *Dams, Damsites, Backwater, Water storage, Irrigation, Flood control.
Identifiers: *Environmental Impact Statements, *Long Draw Reservoir(Colo).

This project entails enlargement of the Long Draw Dam and Reservoir on La Poudre Pass Creek, located near Fort Collins, Colorado. The project includes construction of reservoir recreation facilities, lining short sections of the existing Grand River Ditch to reduce water seepage, and rehabilitation of associated existing ditch structures within Rocky Mountain National Park. The project will provide supplemental water to Front Range irrigators and reservoir related recreation opportunities. The water will irrigate 37,425 acres of cropland, increase crop yields, and stabilize farmer income and the local economy. Other benefits of the project include strengthening the existing dam, accomodating 33,000 visitor days of annual recreation, a permanent pool for maintaining a trout fishery, and reducing downhill erosion adjacent to the Grand River Ditch. About one hundred and six acres of wildlife habitat and one-half mile of a stream fishery will be inundated. Alternative considerations included not construction the project, winterizing the Grand River Ditch, modifying existing water systems and alternative dam and reservoir sites. (Conko-Florida)

NUMERICAL COMPUTATION OF MOMENTUM JETS AND FORCED PLUMES,
Battelle-Pacific Northwest Labs., Richland, Wash.
D. S. Trent, and J. R. Welty.
Computer and Fluids, Vol 1, No 4, p 331-357, December, 1973. 24 fig, 1 tab, 17 ref.

Descriptors: *Mathematical studies, Equations, *Model studies, Turbulent flow, *Jets.
Identifiers: *Plumes.

A numerical study of vertical momentum jets and forced plumes issuing to similar receiving media is presented. The complete partial differential equations governing steady, incompressible, turbulent flow are solved in axisymmetric coordinates using finite difference techniques. Solutions were based on the stream function vorticity transport approach for a Boussineq fluid. Buoyant driving forces were coupled to the vorticity equation which included effects of temperature and other constituents. Turbulent transport coefficients were computed iteratively using the Prandtl eddy diffusivity model. Results for the momentum jet, axial, and radial distributions of velocity and concentration show excellent agreement with published data. Forced plume computations are presented which include similar results for densimetric Froude numbers ranging from 1 to 1000. (Merritt-FIRL)

AN INVESTIGATION OF SECONDARY FLOW EFFECTS IN CURVED CHANNELS OF SQUARE CROSS SECTION,
Naval Postgraduate School, Monterey, Calif.
P. S. Kenney.
Available from NTIS, Springfield, Va. 22151 as AD-764 502 Price $5.50 printed copy; $1.45 microfiche. M Sc Thesis, June 1973. 63 p, 30 fig, 1 tab, 3 ref.

Descriptors: *Open channel flow, *Vortices, Meanders, Turbulent flow, Hydraulic models, Channel morphology.
Identifiers: *Secondary flow.

Turbulent flow in a curved channel of square cross section was investigated experimentally to determine secondary flow effects. Probe surveys were conducted to establish vortex and total pressure loss distribution in the exit plane of a 90 deg bend. Overall losses were determined by measuring the momentum of the flow with a force plate for different Reynolds numbers at turning angles of 0, 45, 90, and 135 deg. There is a definite increase in the average total loss coefficient with turning angle. (Knapp-USGS)
W74-09193

MODEL STUDY OF TROTTERS SHOALS SPILLWAY,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
B. P. Fletcher, and J. L. Grace, Jr.
Available from NTIS, Springfield, Va 22151 as AD-762 539 price $3.00 printed copy; $1.45 microfiche. Technical Report H-73-7, June 1973. 19 p, 9 fig, 24 plate, 12 photo, 1 tab.

Descriptors: *Hydraulic models, *Spillways, *Open channel flow, Hydraulic jump, Spillway crests, Model studies, Energy dissipation, *Georgia, *South Carolina.
Identifiers: *Trotters Shoals Dam(Ga-SC).

The spillway for the Trotters Shoals Dam (Georgia and South Carolina) was tested on a 1:80-scale model to investigate flow conditions in the approach and exit channel and the performance of various elements of the structure. Particular emphasis was placed on the development of an energy dissipator that would provide satisfactory energy dissipation and exit channel flow conditions. Approach flow conditions were improved by revising the left abutment to prevent a severe drawdown of the water surface. After the left abutment was modified, the spillway capacity was equal to that computed. Nappe separation from the downstream quadrant of the crest was prevented by extending the crest piers upstream and shifting the gate slots downstream relative to their original positions. These modifications improved pressure conditions within the gate slots as well as along the spillway crest. The type 3 stilling basin provided more appropriate energy dissipation than flip buckets and it reduced the maximum velocities and the concentration of flow along the left side of the exit channel. The instantaneous forces induced by the hydraulic jump on the monoliths composing the left stilling basin wall were also determined. (Knapp-USGS)

SOME NEW METHODS OF TOPOLOGIC CLASSIFICATION OF CHANNEL NETWORKS,
IBM Thomas J. Watson Research Center, Yorktown Heights, N.Y.
C. Werner, and J. S. Smart.
Available from NTIS, Springfield, Va. 22151 as AD-759 385 - Price $3.00 printed copy; $1.45

microfiche. Technical Report No 9, January 24, 1973. 46 p, 11 fig, 4 tab, 25 ref. ONR Contract N00014-70-C-0188.

Descriptors: *Geomorphology, *Drainage patterns(Geologic), Drainage density, Streams, Channel morphology.
Identifiers: *Topology.

Some new methods for the topologic classification of channel networks are proposed. These methods are all based on the concept of topologic path length, or number of links from the network outlet to a junction or source. Two parameters, the total path length (sum of all path lengths) and the diameter (largest path length), are useful in network analysis. Some advantages of these parameters are that they are easy to measure, have straightforward topologic interpretations, and are closely related to important geometric measures. Moreover, they are capable of explaining various empirical geomorphic laws, such as the 0.6 power relation between mainstream length and area. (Knapp-USGS)

8C. Hydraulic Machinery

AMERICAN RIVER PLANT ADDS AUTOMATED PUMPING STATION.
Instrumentation, Vol 27, No 1, p 6-9, 1974. 6 fig.

Descriptors: *Reservoirs, *Pumping plants, *Automatic control, Remote control, Water supply development, *California.
Identifiers: *Sacramento(Calif), *Florin Reservoir(Calif).

The Florin Reservoir and Pumping Station of the American River Water Treatment Plant is described. It is a remote-control, unmanned facility built completely underground in Sacramento, Calif. The Florin station is equipped with instrumentation which automatically starts, stops, or throttles the appropriate combination of three horizontal centrifugal split case pumps. Completion of the Florin Station represents a significant step in Sacramento's master plan of water system development and expansion to the year 2030 when the plant will handle 330 mgd. (Merritt-FIRL)
W74-08780

TUNNEL FAILURE DELAYS SEWER SYSTEM STARTUP.
Engineering News-Record, Vol 192, No 2, p12, January 10, 1974.

Descriptors: *Pumping plants, *Sewage, Tunnels, *Sewers, Concrete pipes, *Failures.

Operation of a 170 mgd sewage pumping station in lower Manhattan, under construction since 1967, will be delayed until 1975 because of the failure of two sections of interceptor sewer tunnel that have been completed since 1961, waiting to feed the station. The failure of the 300 ft of 9 ft diameter concrete lined interceptor appears related to the construction of the pumping station. The tunnel sections that failed were driven in soft ground under compressed air about 40 ft below the street. Their primary lining is cast iron segmental rings with steel rib support. (Merritt-FIRL)

FRAME FOR A SEMI-PERMEABLE MEMBRANE ASSEMBLY,
Rhone-Poulene S.A., Paris (France). (Assignee)
Y. Butruille, and J. Mourlan.
U.S. Patent 3,805,960. Official Gazette of the U.S. Patent Office, Vol 921, No 4, p 1483, April 23, 1974. 1 fig.

Descriptors: *Semipermeable membranes, *Patents, Equipment, *Membranes.
Identifiers: *Frames.

Frames for clamping together the plane membrane and interposed plates of a semi-permeable membrane stack are described. The frame comprises two frame plates interconnected by tie bars extending from one of the plates to pass through orifices in the other plate. The orifices are countersunk in such a way that the tiebars may be deformed in the orifices to limit subsequent increases in the distance between the two frame plates, so that the semi-permeable membrane stack is held tightly together. (Merritt-FIRL)
W74-08898

AUTOMATIC VALVES, PARTICULARLY FOR USE WITH FILTERS,
Engineering Components Ltd., Liverpool (England). (Assignee)
J. C. Cullis.
U.S. Patent 3,807,561. Official Gazette of the U.S. Patent Office, Vol 921, No 5, p 1909, April 30, 1974. 1 fig.

Descriptors: *Patents, *Valves, *Filters, Equipment, Filtration, Waste water treatment.

An automatic valve of the poppet or mushroom type is described for use with a filter. It is molded as an integral unit from glass fiber reinforced nylon and has a head and a stem consisting of two parallel limbs formed at their free ends with lateral hook-like projections. The limbs can be pressed together to enable the projections to pass through a port in a ported member. They then can be allowed to spring back to their normal configuration, engaging a spring interposed between the projections and ported member. (Merritt-FIRL)

HULAH DAM EMERGENCY BULKHEAD PROTOTYPE CLOSURE TESTS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
W. C. Blanton, J. E. Hall, and D. F. Bastian.
Available from NTIS, Springfield, Va 22151 as AD-767 235; Price $3.50 printed copy; $1.45 microfiche. Miscellaneous Paper H-73-8, September 1973. 17 p, 11 plate, 1 tab.

Descriptors: *Gates, *Spillways, *Bulkhead gates, Flow control, Gate seals, *Oklahoma, Hydraulic structures, Dams.
Identifiers: Hulah Dam(Okla).

The emergency bulkhead gate at Hulah Dam, Oklahoma, was tested to determine its effectiveness in stopping flow at various control gate positions. The bulkhead consistently stopped at a position approximately 2 ft above the seat for every opening of the control gate. Measurements of downpull and acceleration revealed that an average peak hoist force of 22,500 lb occurred with the control gate full open and a bulkhead position of 5.8 to 7.0 ft above the seat. A maximum acceleration of 0.5 g was recorded with the control gate full open and the bulkhead 6 ft above the seat. Emergency closure of the gate under the conditions tested is not possible. REVIEW OF PRECAST PRESTRESSED CONCRETE WATER STORAGE RESERVOIRS,
Natgun Corp., Wakefield, Mass.
K. O. Hodgson.
Journal of the New England Water Works Association, Vol 88, No 1, p 58-63, March, 1974.

Descriptors: *Storage tanks, *Water storage, *Reservoir storage, *Concrete structures, Prestressing, Reviews.
Identifiers: *Precasting.

Precast prestressed concrete water storage reservoirs are discussed. The tanks have a low profile, versatility of installation, require no painting inside or outside, and have low or minimum maintenance requirements. The domed tanks which are more common than flat tops do not have and do not need columns. They do not have to be taken out of service. There are three types of tanks: small tanks in sizes 100,000 to 500,000 gallons of the precast reinforced concrete panel type, with diaphragm, but not wire wound or prestressed; the regular precast prestressed concrete tanks in sizes 500,000 gallons and up, and the concrete domes for existing circular tanks or for circular reservoirs. Exterior architectural treatment is possible for all tanks. (Merritt-FIRL)

UNIVERSITY CREDITS FEEDWATER TREATMENT PROGRAM FOR 50% CUT IN BOILER CLEANING WORK LOAD.
National Engineer, Vol 78, No 2, p 12-13, February, 1974. 5 fig.

Descriptors: *Boilers, *Cleaning, *Corrosion control, Costs, Scaling, Alkalinity, Phosphates, Sludge, Control, *New York, Water treatment.
Identifiers: *Buffalo(N.Y.).

The treatment program for boiler feedwater and condensate return lines at State University of New York at Buffalo is described. It is proving effective by keeping three boilers and more than two miles of return lines free of scale and corrosion. The program consists of alkalinity adjustment, phosphate softening, sludge control, iron sequestration, foam control, and return line corrosion control. It is estimated there is a 50 percent cut in boiler cleaning work load. (Merritt-FIRL)
W74-08797

TECHNICAL DEVELOPMENTS.
Pipes and Pipelines International, Vol 18, No 1, p 39, November, 1973.

Descriptors: *Pipes, *Pipelines, *Welding, Welded joints, Plastics, Drainage system.

Identifiers: Magnetic crack detectors, *United Kingdom.

Technical developments in the pipe and pipeline industry are summarized. An orbital welding machine consisting of an argon arc welding head carrying a tungsten electrode which rotates about the pipe joint was developed by Startrite Designs, Ltd., Gillingham, England. The machine practically eliminates underbead in the pipe bore, so that flow patterns can be considerably improved. An ICI traveling exhibition toured Great Britain to show how pipes made from Propathene, ICI's polypropylene, have solved many industrial pipework problems for drainage and disposal systems. A combined infill/carrier pipe for road and underground drainage was developed from the Turnall asbestos cement pipe of TAC Construction Materials, Ltd., Manchester. A new range of horizontal magnetic particle crack detectors was designed by Vitosonics, Ltd., Current is passed through the test piece to detect longitudinal defects, and magnetic flux generated by a circumferential coil is used for transverse defect indication. (Merritt-FIRL)
W74-08820

CORROSION-RESISTANT PIPE AT WALT DISNEY WORLD.
Water and Sewage Works, Vol 121, No 4, p 52-53, April, 1974.

Descriptors: *Sewers, *Water cooling, *Water distribution(Applied), *Florida, Pipes, *Corrosion control, Pipes, Wells, Water supply.

The chilled water and sewer distribution system buried beneath the ground at Walt Disney World near Orlando, Florida is discussed. The area's high water table and stringent demands for performance resulted in the use of new and unusual corrosion resistant pipe materials. A drainage system keeps the ground stabilized, but pipe inside the trench is often submerged in water. The 24 in diameter Temp-Tite pipe consists of an outer jacket of corrosion resistant asbestos cement pipe, a closed cell polyurethane foam insulation, and an inner core pipe of epoxy lined a-c pipe that carries the water. It is a factory fabricated preinsulated design that does not require expansion joints. The pipe system is connected by ring type joints providing a tight seal and allowing for pipe expansion and contraction. Thrust blocks are required. The pipe is not affected by corrosive soil and does not require cathodic protection. Water supply is plentiful in the Orlando area, and seven wells were built to handle all water needs. (Merritt-FIRL)

Available from the National Technical Information Service as COM-73-11568. California Univ., Institute of Marine Resources, La Jolla, Reference No. 74-3, Sea Grant Publication No. 2, August 1973.

Descriptors: *Bibliographies, *Aquiculture, *Economics, *Shellfish, Mollusks, Oysters, Crustaceans, Shrimp, Crabs, Lobsters, Commercial shellfish.

A selective annotated bibliography of economic data sources and previous economic analyses related to the aquaculture of selected crustaceans and mollusks is presented. While primarily concerned with data related to the Northern lobster, selected references are included for the spiny lobster as well as certain species of oysters, shrimp, and prawns. The bibliography's 111 listings are divided by bibliographies on general aquaculture and specific species, abstracts/indexes, statistical sources, aquaculture, natural fisheries, fisheries with potential for aquaculture, product marketing studies and an author index. ENVIRONMENT: A BIBLIOGRAPHY OF SOCIAL SCIENCE AND RELATED LITERATURE.
Michigan State Univ., Lansing.
Environmental Protection Agency, Socioeconomic Studies Series Report EPA-600/5-74-011, February 1974, 860 p. Compiled by D. E. Morrison, K. E. Hornback, W. K. Warner. EPA R-801234.

Descriptors: *Bibliographies, *Social aspects, Information retrieval. Social impact, Attitudes, Community development, Political aspects, Psychological aspects, Landscaping, *Environment.

This comprehensive, unannotated bibliography contains nearly 5,000 items covering literature in and related to the Fields of anthropology, communications, economics, education, design, geography, history, human ecology, landscape architecture, management, planning, politics and social psychology and sociology. The emphasis is on literature that is substantively, methodologically or theoretically relevant to man and his activities in relationship to natural environments. The bibliography is listed alphabetically by author, with an extensive, crosslisted subject-by-title index under 42 categories: Aesthetic, Humanistic, Literary, Religious, Philosophic; Agriculture, Food, Ranching, Rural; Air; Anthropology; Attitudes, Behavior, Opinions, Motives Values, Perceptions, Cognitions, Knowledge, Psychology, Social Psychology; Built Environment-Natural Environment Interface, Including Urban Environment-Natural Environment Relationships; Climate; Communications, Media; Conflicts, Controversy, Competion, Issues; Conservation, Conservation Movement; Economics, Business, Industry, Economic Growth and Development, Work, Occupations; Education; Energy, Minerals; Forests; General Ecology, General Environment, Social Ecology, Human Ecology, Eco-Systems; Geography, Regional Studies; Government, Public Agencies; History; International, Interstate, Intergovernmental, Interagency; Land; Law, Property Rights; Management, Policy, Decision Making, Planning, Development; Medicine, Health; Methodology, Evaluation, Measurement, Indicators, Systems Analysis, Cost-Benefit Techniques, Projections, Monitoring, Control, Standards, Performance Criteria, Theory, Concepts; Natural Disasters, Natural Hazards; Natural Resources, General; Noise; Place Names in Title; Politics; Pollution; Population, Demography, Migration, Crowding; Quality of Life, Affluence, Living Standards, General Environmental Quality; Readers, Conference Proceedings, Special Issues, Textbooks; Recreation, Leisure, Parks, Wilderness, Wildlife, Nature; Reference: Bibliogra-

phies, Data Sets, Catalogs, Directories, Literature Surveys and Reviews; Science, Technology; Sociology, Social Organization, Institutions, Culture, Society; Space, Spatial Behavior, Territoriality; Transportation; Voluntary Action, Voluntary Organizations, Citizen Participation, Social Movements; Waste; and Water.

A Bill to Create a Marine Resources Conservation and Development Fund; To Provide for the Distribution of Revenues from Outer Continental Shelf Lands; and for Other Purposes.
W74-09140 6E

CONSERVATION (NATURAL RESOURCES)
Conservation and Land Development.
W74-09153 6E

CONSTITUTIONAL LAW
Ray v. Ranowsky (Injunction Against Construction of Drain in Watershed).
W74-09132 6E

CONTINENTAL DRIFT
Continental Drift and Thermal Fields,
W74-08998 2F

CONTINENTAL SHELF
A Bill to Create a Marine Resources Conservation and Development Fund; To Provide for the Distribution of Revenues from Outer Continental Shelf Lands; and for Other Purposes.
W74-09140 6E

CONTOURS
The Effect of Data Density on Groundwater Contouring Accuracy,
W74-08781 2F

CONTRACTS
Turnkey Contracts for Sewage Treatment Plants,
W74-08786 5D

CONTROL
Multinationals Need New Environmental Strategies,
W74-09071 6B

In-Process Pollution Abatement: Upgrading Metal-Finishing Facilities to Reduce Pollution,
W74-09080 5G

CONTROL SYSTEMS
Instrumentation and Automatic Control of Phosphorus Removal Processes,
W74-08856 5D

Trent-Witham-Ancholme Scheme and Project of the Lincolnshire River Authority,
W74-08882 6E

COORDINATION
Prospects of Scientific and Technical Cooperation Between the USSR and the United States in the Use of Water Resources (Perspektivy nauchno-tekhnicheskogo sotrudnichestva mezhdu SSSR i SShA v oblasti ispol'zovaniya vodnykh resurs ov),
W74-08703 6E

Public Water Supply, Sewerage and Solid Waste Disposal System.
W74-09156 6E

COOSA RIVER
Development of Water Quality Models Using Spectral Analysis and Parameter Estimation Techniques,
W74-08936 5G

COPEPODS
Respiration and Osmotic Behaviour of the Copepod Acartia Tonsa in Diluted Sea Water,
W74-08717 5C

Infestation of the Copepod Acartia Tonsa with the Stalked Ciliate Zoothamnium,
W74-08720 5C

On the Rearing of Copepods in the Laboratory, (Sur l'elevage de copepodes au laboratoire),
W74-08721 5C

Survival of Some Pelagic Copepods of the Black and Mediterranean Seas in Water of Different Salinity, (Vyzhivanie nekotorykh pelagicheskikh kopepod Chernogo i Vredizemnogo morei v vode razlichnoi solenosti),
W74-08725 5C

Effects of Copepod Grazing on Two Natural Phytoplankton Populations,
W74-08726 5C

Laboratory Culture, Growth Rate, and Feeding Behavior of a Planktonic Marine Copepod,
W74-08732 2I

Remating in a Planktonic Marine Calanoid Copepod,
W74-08735 2I

The Salinity Tolerance of Some Estuarine Planktonic Copepods,
W74-08738 5C

A Continuous Recirculating Culture System for Planktonic Copepods,
W74-08740 5C

Experimental Study of Egg-Laying in Three Neritic Copepod Species (Centropages Typicus, Acartia Clausi, and Temora Stylifera).
W74-08741 2L

Culture of a Planktonic Calanoid Copepod Through Multiple Generations,
W74-08744 2I

The Role of Organic Debris and Associated Micro-Organisms in Pelagic Estuarine Food Chains,
W74-08837 5C

COPPER
Heavy Metal Concentrations in Museum Fish Specimens: Effects of Preservatives and Time,
W74-08792 5A

COPPER WIRE MILL
Pollution Abatement in a Copper Wire Mill.
W74-09244 5G

CORN (FIELD)
Controlled Environment Studies of the Effects of Variable Atmospheric Water Stress on Photosynthesis, Transpiration, and Water Status of Zea mays L. and Other Species,
W74-08754 2D

Effect of Supplemental Water on Barley and Corn Production in a Subhumid Region,
W74-08803 3F

A Computer Simulation of Corn Grain Production,
W74-08917 3F

Rationale for Optimum Nitrogen Fertilization in Corn Production,
W74-08929 3F

CORROSION CONTROL
University Credits Feedwater Treatment Program for 50% Cut in Boiler Cleaning Work Load.
W74-08797 8G

Corrosion-Resistant Pipe at Walt Disney World.
W74-08892 8G

COSHOCTON WATERSHED (OHIO)
Effect of Long-Term Management on Physical and Chemical Properties of the Coshocton Watershed Soils,
W74-08813 4D

COST ANALYSIS
Efficiency and Equity in Augmenting Water Supply,
W74-09051 6B

A Cost Analysis of Waste Management in the Steel Industry,
W74-09082 6B

COST-BENEFIT ANALYSIS
Efficiency and Equity in Augmenting Water Supply,
W74-09051 6B

COST-BENEFIT THEORY
Non-Efficiency Objectives and Decision-Making in Water Resource Developments,
W74-09084 6A

COST-BENEFITS ANALYSIS
Modeling of Hydrologic Processes and Water Salvage Procedures in Semiarid Regions,
W74-08702 5D

COST COMPARISONS
Use of Lime for Phosphorus Removal.
W74-08858 5D

COST EFFECTIVENESS
Design of Cost-Effective Water Quality Surveillance Systems,
W74-08825 5A

COSTA RICA
Geothermal Resources of Costa Rica.
W74-08977 2F

COSTS
Analysis of Pollution Control Costs,
W74-08829 5G

Phosphorus Removal Costs,
W74-08855 5D

A Tanner Looks at the Federal Water Pollution Control Act Amendments of 1972,
W74-08863 5G

The Economics of Environmental Quality Measurement,
W74-09243 5G

COTTON
Cotton Leaf Temperatures as Related to Soil Water Depletion and Meteorological Factors,
W74-08755 3F

Cotton Leaf Temperatures as Related to Soil Water Depletion and Meteorological Factors,
W74-08812 3F

COTTON (FIELD)
Pima Cotton Lint Yield as Influenced by Irrigation Schedule, Cultivar and Altitude,
W74-08807 3F

Cell Wall Properties of Cotton Roots as Influenced by Calcium and Salinity,
W74-08808 3C

COTTON GROWTH
Sewage Water Irrigation Effect on Cotton Growth and Development, (In Russian),
W74-08729 5D

CRABS
Impact of Beach Nourishment on Distribution of Emerita Talpoida, the Common Mole Crab,
W74-08894 5C

CROP PRODUCTION
Salinity Problems of the Safford Valley: An Interdisciplinary Analysis,
W74-08769 5B

A Computer Simulation of Corn Grain Production,
W74-08917 3F

CROP RESPONSE
Yield Response of Soybean Varieties Grown At Two Soil Moisture Stress Levels,
W74-08805 3F

Pima Cotton Lint Yield as Influenced by Irrigation Schedule, Cultivar and Altitude,
W74-08807 3F

Cell Wall Properties of Cotton Roots as Influenced by Calcium and Salinity,
W74-08808 3C

Water Stress Relations of the Potato Plant under Field Conditions,
W74-08811 3F

Cotton Leaf Temperatures as Related to Soil Water Depletion and Meteorological Factors,
W74-08812 3F

Effect of Long-Term Management on Physical and Chemical Properties of the Coshocton Watershed Soils,
W74-08813 4D

Leaching Requirement Studies: Sensitivity of Alfalfa to Salinity of Irrigation and Drainage Waters,
W74-08815 3C

Growth, Mineral Composition, and Seed Oil of Sesame (Sesamum Indicum L.) as Affected by NaCl,
W74-08816 3C

CRYSTALLIZATION
Sulfuric Acid and Ferrous Sulfate Recovery From Waste Pickle Liquor,
W74-08945 5D

CULTURE METHODS
Early Life History and Feeding of Young Mountain Whitefish,
W74-08832 5C

CULTURES
The Effect of Temperature on the Growth and Survival of Seven Marine Algal Species,
W74-08718 5C

Some Chemical Considerations in the Design of Synthetic Culture Media for Marine Algae,
W74-08722 5C

An Algal Mass Culture Unit for Feeding Marine Invertebrate Larvae,
W74-08723 5C

Some Methodical Observations on the Use of Antibiotics for Preparing Bacteria-Free Algal Cultures,
W74-08724 5C

The Development of Artificial Media for Marine Algae,
W74-08734 2I

Influence of Some Environmental Factors on Productivity of Planktonic Algae in Culture. (Etude de l'influence de quelques facteurs de milieu sur la productivite d'une algue planctonique en culture).
W74-08743 5C

Culture of a Planktonic Calanoid Copepod Through Multiple Generations,
W74-08744 2I

The Production of Extracellular Carbohydrates by Some Marine Flagellates,
W74-08746 5C

CURRENTS (WATER)
Problems of the Regime and Investigation of Lakes and Reservoirs (Voprosy rezhima i issledovaniya ozer i vodokhranilishch),
W74-09100 2H

Results of On-site Investigations of Currents in the Southern Part of Lake Baykal (Rezul'taty naturnykh issledovaniy techeniy v yuzhnom Baykale),
W74-09103 2H

A Dynamic Method and Its Application to Investigations of Currents in Inland Bodies of Water (Dinamicheskiy metod i yego primeneniye dlya issledovaniy techeniy vo vnutrennikh vodoyemakh),
W74-09105 2H

CYANOPHYTA
A Study of the Eutrophication of the Surface Waters of Pyramid Lake,
W74-08938 5C

CYCLOPS VICINUS
On the Rearing of Copepods in the Laboratory, (Sur l'elevage de copepodes au laboratoire),
W74-08721 5C

CYCLOTELLA NANA
Phosphorus Content and Rate of Growth in the Diatoms Cyclotella Nana and Thalassiosira Fluviatilis,
W74-08719 5C

Light Quality and Concentration of Proteins, RNA, DNA and Photosynthetic Pigments in Two Species of Marine Plankton Algae,
W74-08736 5C

Light Quality in Relation to Growth, Photosynthetic Rates and Carbon Metabolism in Two Species of Marine Plankton Algae,
W74-08737 5C

CYTOLOGICAL STUDIES
Photosynthesis in Cell Development,
W74-08713 5C

Culture Studies of Marine Algae. I. Eisenia Arborea,
W74-08733 2I

CZECHOSLOVAKIA
Floc Blanket Clarification.
W74-08884 5D

Geothermal Areas of Czechoslovakia,
W74-08982 2F

Geothermal Exploration of Hot Water Sources in the Carpathians of Yugoslavia and Czechoslovakia,
W74-08983 2F

Terrestrial Heat Flow in the Territory of Czechoslavakia and the Measurement of Thermal Conductivity with Fully-Automatic Apparatus,
W74-09004 4B

DAIRY INDUSTRY
Waste Accumulation on a Selected Dairy Corral and Its Effect on the Nitrate and Salt of the Underlying Soil Strata,
W74-08921 5B

DAM DESIGN
Fall and Rise of Lago Del Oro,
W74-08751 4A

DAMS
One Dammed Thing After Another,
W74-09136 5G

Proposed Long Draw Reservoir Enlargement Project, Colorado, an Application Under the Small Reclamation Projects Act (Final Environmental Impact Statement).
W74-09172 8A

DAMSITES
The Upper Hudson Whitewater or Washwater,
W74-09137 6D

DANUBE RIVER
Ecological Equilibrium of River-Estuary-Sea Systems and Improvement of Their Efficiency for the National Economy (O ekologicheskom ravnovesii sistem reka-liman-more i povyshenii ikh narodnokhozyaystvennoy effektivnosti),
W74-08708 2L

DAPHNIA
Use of Daphnia Magna for the Microbio-Assay of Pesticides, I. Development of Standardized Techniques for Rearing Daphnia and Preparation of Dosage Mortality Curves for Pesticides,
W74-08714 5A

DARCY'S LAW
Some Aspects of Approximating Aquifer Discharge,
W74-09096 2F

DATA COLLECTION
Design of Cost-Effective Water Quality Surveillance Systems,
W74-08825 5A

DATA COLLECTIONS
The Effect of Data Density on Groundwater Contouring Accuracy,
W74-08781 2F

Health and Safety Laboratory Fallout Program -- Quarterly Summary Report -- December 1, 1973 Through March 1, 1974,
W74-08954 5B

Health and Safety Laboratory Fallout Program -- Quarterly Summary Report -- December 1, 1973 Through March 1, 1974, (Appendix),
W74-08956 5A

Preoperational Levels of Environmental Radioactivity in Water and Sediment Around Turkey Point Nuclear Power Plants, Card Sounds, Florida,
W74-08971 5A

Water Resources Data for Georgia, 1973.

DDD
Dechlorination of DDT by Aerobacter Aerogenes,
W74-08739 5B

DDE
Accumulation of DDT by Aquatic Indicator Organisms,
W74-08716 5C

Deposition of DDE and Polychlorinated Biphenyls in Dated Sediments of the Santa Barbara Basin,
W74-09097 5B

DDT
Accumulation of DDT by Aquatic Indicator Organisms,
W74-08716 5C

Marine Phytoplankton Vary in Their Response to Chlorinated Hydrocarbons,
W74-08728 5C

Marine Phytoplankton Vary in Their Response to Chlorinated Hydrocarbons,
W74-08730 5C

Dechlorination of DDT by Aerobacter Aerogenes,
W74-08739 5B

DECHLORINATION
Dechlorination of DDT by Aerobacter Aerogenes,
W74-08739 5B

DECISION MAKING
Environmental Impact Analysis: A Review of Three Methodologies,
W74-08839 6G

A Stochastic Investment Model for a Survival Conscious Firm Applied to Shrimp Fishing,
W74-09072 6B

DEEP PERCOLATION
Water Loss from an Irrigated Sorghum Field: II. Evapotranspiration and Root Extraction,
W74-09249 3F

DEIONIZED WATER
Boron Release from Deionizers,
W74-08873 5B

DELAWARE RIVER
Final Environmental Statement Related to the Proposed Hope Creek Generating Station Units 1 and 2.
W74-08959 5C

DEMAND
How Well do Engineers Forecast Demands,
W74-08905 5G

DEMINERALIZATION
Development of a High Product Water Recovery System for the Treatment of Acid Mine Drainage by Reverse Osmosis,
W74-08841 5D

DENITRIFICATION
Research Round Up.
W74-08787 5D

DENMARK
Environmental Radioactivity in Denmark in 1972,
W74-09087 5B

DENSITY
Light and Temperature Relations in a Small Desert Pond as Influenced by Phytoplanktonic Density Variations,
W74-08758 5C

DENSITY CURRENTS
Lake Mead, a Case History,
W74-08748 4A

DEPTH
Depth Distribution of Water Temperature in the Kakhovka Reservoir (Raspredeleniye temperatury vody po glubine v Kakhovskom vodokhranilishche),
W74-09107 2H

DESALINATION
Some Aspects of the Problem of Artificial Desalination of Natural Waters of High Dissolved-Salts Content (Nekotoryye aspekty problemy iskusstvennogo opresneniya prirodnykh vod povyshennoy mineralizatsii),
W74-08711 3A

Development of a High Product Water Recovery System for the Treatment of Acid Mine Drainage by Reverse Osmosis,
W74-08841 5D

Seawater Desalination with PBI Hollow Fiber Reverse Osmosis Membranes,
W74-08842 3A

Application of Externally Wound Tubular Membrane Systems for Sea Water Desalination,
W74-08843 3A

Application of Reverse Osmosis Technology to Hawaiian Low Quality Waters,
W74-09052 5D

Multi-Stage Flash Distillation Plant,
W74-09174 3A

Process and Apparatus for Solar Distillation Utilizing Cellular Ceramic Nodules to Improve the Evaporation Rate,
W74-09179 3A

Obtaining Increased Head in Water Systems,
W74-09187 3A

DESALINATION PLANTS
Some Aspects of the Problem of Artificial Desalination of Natural Waters of High Dissolved-Salts Content (Nekotoryye aspekty problemy iskusstvennogo opresneniya prirodnykh vod povyshennoy mineralizatsii),
W74-08711 3A

Desalting the Seas: A Step Toward World Peace,
W74-09167 3A

Public Response to Desalted Sea Water,
W74-09171 6D

DESALINATION PROCESSES
Some Aspects of the Problem of Artificial Desalination of Natural Waters of High Dissolved-Salts Content (Nekotoryye aspekty problemy iskusstvennogo opresneniya prirodnykh vod povyshennoy mineralizatsii),
W74-08711 3A

DESICCATION
Effects of Various Water Regimes on Stomatal and Mesophyll Conductances of Bean Leaves,
W74-09247 3F

DESIGN
Design of Filtration Plant for Rockville, Connecticut,
W74-08910 5F

DESIGN CRITERIA
Some Plant Design Considerations in Phosphorus Removal Facilities,
W74-08854 5D

Use of Lime for Phosphorus Removal,
W74-08858 5D

A Portable Device for Measuring Wastewater Flow in Sewers,
W74-09061 5D

DESIGN DATA
Fort Worth Water Supply and Treatment Plant Dedicated.
W74-08904 5D

DESIGN STANDARDS
Deep-Bed Filtration,
W74-08784 5F

DESILTING
Feasibility Study of Hydrocyclone Systems for Dredge Operations,
W74-09202 5D

DESORPTION
Solution and Adsorbed Fluometuron Concentration Distribution in a Water-Saturated Soil: Experimental and Predicted Evaluation.
W74-08924 2G

DETERGENTS
The Development of Phosphate Free Heavy Duty Detergents,
W74-08830 5C

Relationship Between BOD Removal and LAS Detergent Removal in Wastewater Treatment Systems,
W74-08939 5D

DETRITUS
The Role of Organic Debris and Associated Micro-Organisms in Pelagic Estuarine Food Chains,
W74-08837 5C

DETROIT RIVER
Development of Water Quality Models Using Spectral Analysis and Parameter Estimation Techniques,
W74-08936 5G

DEUTERIUM
Deuterium and Chloride in Geothermal Studies in Iceland,
W74-09022 2K

DEW POINT
Prediction of Dew Point Temperature, Solar Radiation and Wind Movement Data for Simulation and Operations Research Models,
W74-08933 2B

DEWATERING
Thickening and Dewatering Sludges Produced in Phosphate Removal,
W74-08860 5D

DIATOMS
Phosphorus Content and Rate of Growth in the Diatoms Cyclotella Nana and Thalassiosira Fluviatilis,
W74-08719 5C

Effect of Industrial Wastes of Memphis and Shelby County on Primary Planktonic Producers,
W74-08840 5C

DIRECTORIES
Great Lakes Research Project Forecasts Directory 1973,
W74-09118 2H

DISCHARGE (WATER)
Some Aspects of Approximating Aquifer Discharge,
W74-09096 2F

DISSOLVED OXYGEN
Simulation of Dissolved Oxygen Profile,
W74-08823 5B

DISSOLVED SOLIDS
Chemical Composition of Water Supplies to Naval and Marine Corps Air Stations,
W74-09227 5A

DISTILLATION
Treatment of Sulfite Evaporator Cendensates for Recovery of Volatile Components,
W74-09066 5D

Multi-Stage Flash Distillation Plant,
W74-09174 3A

DISTRIBUTION
Radioactivity Distribution in the Stratosphere From Chinese and French High Yield Nuclear Tests (1967-1970),
W74-08955 5B

The Distribution of Cobalt-60 Ruthenium-106 and Cesium-137 Among Suspended and Dissolved Particles in White Oak Lake,
W74-08964 5B

Depth Distribution of Water Temperature in the Kakhovka Reservoir (Raspredeleniye temperatury vody po glubine v Kakhovskom vodokhranilishche),
W74-09107 2H

DISTRIBUTION PATTERNS
Distribution of Phosphates in Lake Mariut, a Heavily Polluted Lake in Egypt,
W74-08881 5B

Distribution of Selected Trace Metals in Southern Lake Michigan and Lower Green Bay,
W74-08934 5B

Vertical Differentation of Tien-Shan Torrents, Based on the Distribution of Characteristics of Water Insects, (in Russian),
W74-09063 2I

Do Nuclear Plants Make Deadly Neighbors,
W74-09123 5G

DISTRIBUTION SYSTEMS
Controlled Sprinkler Irrigation System for Equalized Water Distribution Developed in Israel.
W74-08818 3F

DIVERSION
Procedural Problems in Projected Planning of Water Consumption and Diversion by Industry in the USSR (Metodicheskiye voprosy rascheta vodopotrebleniya i vodootvedeniya v promyshlennosti SSSR na perspektivu),
W74-08710 3E

DIVERSION STRUCTURES
Turbidity Control by Automatic Diversion,
W74-08889 5D

DNA
Light Quality and Concentration of Proteins, RNA, DNA and Photosynthetic Pigments in Two Species of Marine Plankton Algae,
W74-08736 5C

DNIEPER RIVER
Ecological Equilibrium of River-Estuary-Sea Systems and Improvement of Their Efficiency for the National Economy (O ekologicheskom ravnovesii sistem reka-liman-more i povyshenii ikh narodnokhozyaystvennoy effektivnosti),

Environmental Impact Analysis: A Review of Three Methodologies,
W74-08839 6G

ENVIRONMENTAL IMPACT STATEMENT
Final Environmental Statement Related to Operation of Nine Mile Point Nuclear Station Unit 1.
W74-08960 2H

ENVIRONMENTAL IMPACT STATEMENTS
A Fossil Plant Environmental Impact Study,
W74-08874 5C

Final Environmental Statement Related to the Proposed Hope Creek Generating Station Units 1 and 2.
W74-08959 5C

Final Environmental Statement Related to Construction of St. Lucie Plant, Unit 2.
W74-08961 5C

Nuclear Energy and the Environment, An Interview with A.G.C. Commissioner Dixie Lee Ray,
W74-09135 5G

Proposed Long Draw Reservoir Enlargement Project, Colorado, an Application Under the Small Reclamation Projects Act (Final Environmental Impact Statement).
W74-09172 8A

ENVIRONMENTAL PROTECTION
Environmental Protection and Energy Conservation go Hand-in-Hand.
W74-08865 5B

ENVIRONMENTAL QUALITY
Promoting Environmental Quality Through Urban Planning and Controls,
W74-08828 5G

ENVIRONMENTAL RADIATION DOSES
Environmental Radiation Dose Criteria and Assessment-Pathway Modeling and Surveillance,
W74-08875 5B

ENVIRONMENTAL SANITATION
County Sanitation Facilities Inspection.
W74-09165 6E

EQUIPMENT
Chemical Handling: The Chemical Feeder and Its Related System When Applied to Alum, Ferric Chloride, Lime and Polymers,
W74-08857 5D

Development and Future of Dredging,
W74-08893 5G

Device for Conducting Waste Liquid from a Receptacle to a Pneumatic Liquid Disposal System,
W74-08901 8A

EQUITY
Efficiency and Equity in Augmenting Water Supply,
W74-09051 6B

Failure of Bribes and Standards for Pollution Abatement,
W74-09240 5G

EROSION CONTROL
Soil and Water Conservation.
W74-09169 6E

ERROR ANALYSIS
A Sensitivity and Error Analysis of Procedures Used for Estimating Evaporation,
W74-09201 2D

ERTS
Evaluation of ERTS Data for Certain Hydrological Uses,
W74-09230 2C

Survey of Lake Flooding from ERTS-1: Lake Champlain.
W74-09231 2H

ESTIMATING
Estimation and Mapping of Rates of Exchange of Fresh Groundwater in the Baltic Artesian Basin (Otsenka i kartirovaniye tempov vodoobmena presnykh podzemnykh vod (na primere Pribaltiyskogo artezianskogo basseyna)),
W74-08705 2F

A Comparative Estimate of Energy Losses in Water Bodies and in Tranquil and Turbulent Flows (Sravnitel'naya otsenka poter' energii v vodoyemakh, spokoynykh i burnykh potokakh),
W74-09109 2H

ESTUARIES
Ecological Equilibrium of River-Estuary-Sea Systems and Improvement of Their Efficiency for the National Economy (O ekologicheskom ravnovesii sistem reka-liman-more i povyshenii ikh narodnokhozyaystvennoy effektivnosti),
W74-08708 2L

Stochastic Model of Dynamic Eutrophic Estuary,
W74-09114 5B

ESTUARINE ENVIRONMENT
Investigation of Surface Films - Chesapeake Bay Entrance,

1971 Tillamook Bay Resource Use Study,
W74-09085 6B

EUTROPHICATION
Comprehensive Management of Phosphorus Water Pollution,
W74-08826 5C

A Study of the Eutrophication of the Surface Waters of Pyramid Lake,
W74-08938 5C

Protocol for Evaluating the Nitrogen Status of Lake Sediments,
W74-09065 5C

Stochastic Model of Dynamic Eutrophic Estuary,
W74-09114 5B

EVALUATION
The Archaeological Resources of the Salmon River Canyon, A Methodology Study to Develop Evaluation Criteria For Wild and Scenic Rivers,
W74-08845 6E

Water Utilities Operator Training: A Worthy Investment,
W74-08879 5D

EVAPORATION
Air Temperature and Vapor Pressure Changes Caused by Spinkler Irrigation,
W74-08757 3F

Process and Apparatus for Solar Distillation Utilizing Cellular Ceramic Nodules to Improve the Evaporation Rate,
W74-09179 3A

A Sensitivity and Error Analysis of Procedures Used for Estimating Evaporation,
W74-09201 2D

EVAPORATORS
Treatment of Sulfite Evaporator Cendensates for Recovery of Volatile Components,
W74-09066 5D

Multi-Stage Flash Distillation Plant,
W74-09174 3A

EVAPOTRANSPIRATION
Measurement of Evapotranspiration in the Presence of Advection, by means of a Modified Energy Balance Procedure,
W74-08760 2D

Plant Water Status in Relation to Clouds,
W74-08801 2D

EVAPOTRANSPIRATION

Digital-Computer Programs for Analysis of Ground-Water Flow,
W74-09115 2F

Water Loss from an Irrigated Sorghum Field: II. Evapotranspiration and Root Extraction,
W74-09249 3F

EXTENDED AERATION
Transient Analysis of a State Park Extended Aeration Wastewater Facility,
W74-08838 5D

FABRICATI INSTRUMENTATION
A Portable Device for Measuring Wastewater Flow in Sewers,
W74-09061 5D

FAILURES
Tunnel Failure Delays Sewer System Startup.
W74-08790 8C

FALLOUT
Health and Safety Laboratory Fallout Program -- Quarterly Summary Report -- December 1, 1973 Through March 1, 1974,
W74-08954 5B

Health and Safety Laboratory Fallout Program -- Quarterly Summary Report -- December 1, 1973 Through March 1, 1974, (Appendix),
W74-08956 5A

Environmental Radioactivity in the Faroes in 1972,
W74-09086 5B

Environmental Radioactivity in Denmark in 1972,

INVESTIGATION GUIDELINES
Guidelines for Conducting Treatability Studies for Phosphorus Removal at Wastewater Treatment Plants.
W74-08848 5D

INVESTIGATIONS
A Program for the Exploration of High Temperature Areas in Iceland.
W74-08981 2F

Geothermal Exploration of Hot Water Sources in the Carpathians of Yugoslavia and Czechoslovakia.
W74-08983 2F

Development of Research and Utilization of Geothermal Resources in the USSR.
W74-08985 2F

Geothermal Resources of the USSR and Prospects for Their Practical Use,
W74-08986 2F

Exploitation of the Matsukawa Geothermal Area,
W74-08992 2F

Types of Commercial Deposits of Thermal Underground Waters and Some Views on the Assessment of Their Reserves.
W74-08994 2F

Thermal Studies as a Technique in Subsurface Structural Investigations,
W74-08995 2F

Geohydrology of the Laugarnes Hydrothermal System in Reykjavik, Iceland,
W74-08996 2F

Geophysical Exploration Through Geologic Cover,
W74-09000 2F

INVESTIGATIONS

Geothermal Prospecting in Shallow Holes and Its Limitations,
W74-09001 2F

Evaluation of Operational Reserves of High Temperature Waters,
W74-09003 2F

The Behaviour of the Wairakei Geothermal Field During Exploitation,
W74-09025 4B

A Study of the Reservoir at the Matsukawa Geothermal Field,
W74-09026 4B

Some Geothermal Measurements at the Otake Geothermal Area,
W74-09027 2F

INVESTIGATIONS *HYDROGEOLOGY

An Estimate of the Natural Heat Resources in a Thermal Area in Iceland,
W74-09009 2F

IODINE RADIOISOTOPES

Detection Systems for the Low Level Radiochemical Analysis of Iodine-131, Iodine-129 and Natural Iodine in Environmental Samples,
W74-08885 5A

ION EXCHANGE

Calcium-Magnesium-Potassium Equilibria in Some California Soils,
W74-08814 2G

Fluid Sample Analysis System,
W74-08914 7B

Interacting Diffuse Layers in Mixed Mono-Divalent Ionic Systems,
W74-08920 2G

Water Treating Apparatus,
W74-09189 5D

Pure Water Supply Device,
W74-09192 5F

IOWA

Ditch v. Hess (Action to Restore Free Flow of Surface Water).
W74-09130 6E

Jenkins v. Pedersen (Action by Adjoining Property Owner Against Neighbor for Diverting Surface Water Onto Plaintiff's Property).
W74-09131 6E

IRAQ

The Improvement of Poor Structured Basin Depression Soils at Fudhaliya Experimental Field,
W74-08763 3C

IRON

Phosphorus Removal in Seasonal Retention Lagoons by Batch Chemical Precipitation,
W74-08851 5D

Effect of Mine Drainage on the Quality of Streams in Colorado, 1971-72,
W74-09228 5B

IRRIGABLE LAND

Soil Associations and Land Classification for Irrigation, Taos County,
W74-09054 3F

Suitability of New Mexico Lands for Irrigation,
W74-09055 3F

Soil Associations and Land Classification For Irrigation, McKinley County,
W74-09056 3F

Soil Associations and Land Classification for Irrigation, Valencia County,
W74-09057 3F

IRRIGATION

Sewage Water Irrigation Effect on Cotton Growth and Development, (In Russian),
W74-08729 5D

Types of Irrigation Systems,
W74-08800 3F

Effect of Supplemental Water on Barley and Corn Production in a Subhumid Region,
W74-08803 3F

Yield Response of Soybean Varieties Grown At Two Soil Moisture Stress Levels,
W74-08805 3F

Pima Cotton Lint Yield as Influenced by Irrigation Schedule, Cultivar and Altitude,
W74-08807 3F

Cotton Leaf Temperatures as Related to Soil Water Depletion and Meteorological Factors,
W74-08812 3F

1973 Irrigation Survey.
W74-08817 3F

Boron Release from Deionizers,
W74-08873 5B

Design and Operation of Land Treatment Systems for Minimum Contamination of Ground Water,
W74-09089 5D

Prospective Costs of Adjusting to a Declining Water Supply: Texas High Plains,
W74-09242 6D

IRRIGATION DESIGN

Trickle Irrigation -- Application Uniformity from Simple Emitters,
W74-08918 3F

IRRIGATION POTENTIAL

Soil Associations and Land Classification for Irrigation, Taos County,
W74-09054 3F

Suitability of New Mexico Lands for Irrigation,
W74-09055 3F

Soil Associations and Land Classification For Irrigation, McKinley County,
W74-09056 3F

Soil Associations and Land Classification for Irrigation, Valencia County,
W74-09057 3F

IRRIGATION PRACTICES

Effect of Supplemental Water on Barley and Corn Production in a Subhumid Region,
W74-08803 3F

Development of Automated Surface Irrigation,
W74-08804 3F

Yield Response of Soybean Varieties Grown At Two Soil Moisture Stress Levels,
W74-08805 3F

Pima Cotton Lint Yield as Influenced by Irrigation Schedule, Cultivar and Altitude,
W74-08807 3F

Cotton Leaf Temperatures as Related to Soil Water Depletion and Meteorological Factors,
W74-08812 3F

Leaching Requirement Studies: Sensitivity of Alfalfa to Salinity of Irrigation and Drainage Waters,
W74-08815 3C

1973 Irrigation Survey.
W74-08817 3F

Controlled Sprinkler Irrigation System for Equalized Water Distribution Developed in Israel,
W74-08818 3F

Soil Crusting Related to Sprinkler Intensity,
W74-08844 3F

Trickle Irrigation -- Application Uniformity from Simple Emitters,
W74-08918 3F

Evaluation of Graded Furrow Irrigation with Length of Run on a Clay Loam Soil,
W74-08927 3F

Dynamic Simulation of Automated Subsurface Irrigation Systems,
W74-08931 3F

Furrow Irrigation Criteria for Hawaiian Sugarcane,
W74-08932 3F

IRRIGATION SYSTEMS

Types of Irrigation Systems,
W74-08800 3F

Development of Automated Surface Irrigation,
W74-08804 3F

IRRIGATION WATER

Comparative Study on the Interactive Effect of Qualities of Irrigation Water and Fertilizer Levels on the Yield of Wheat Grown on Different Soils,
W74-08779 3F

ISOCHRYSIS GALBANA

Extracellular Carbohydrate Liberation in the Flagellates Isochrysis Galbana and Prymnesium Parvum,
W74-08745 5C

ISOHYETS

A Note on the Remarkably Low Rainfall of the Sudan Zone in 1913,
W74-08759 2B

ISOTOPE STUDIES

Thorium Isotope Content in River Water in Japan,
W74-08772 5B

ISRAEL

Controlled Sprinkler Irrigation System for Equalized Water Distribution Developed in Israel,
W74-08818 3F

JAPAN

Thorium Isotope Content in River Water in Japan,
W74-08772 5B

Treatment of Beet Factory-Waste Water by Activated Sludge Process (Biosorption Process), (In Japanese),

Yield Response of Soybean Varieties Grown At Two Soil Moisture Stress Levels,
W74-08805 3F

Water Stress Relations of the Potato Plant under Field Conditions,
W74-08811 3F

Water Loss from an Irrigated Sorghum Field: I. Water Flux Within and Below the Root Zone,
W74-09248 3F

SOIL RESPIRATION
Soil Respiration in Different Types of Southeast Asian Tropical Rain Forest, (In German),
W74-09246 2G

SOIL STRENGTH
Soil Crusting Related to Sprinkler Intensity,
W74-08844 3F

SOIL TEXTURE
The Improvement of Poor Structured Basin Depression Soils at Fudhaliya Experimental Field,
W74-08763 3C

SOIL WATER
Cotton Leaf Temperatures as Related to Soil Water Depletion and Meteorological Factors,
W74-08812 3F

Solution and Adsorbed Fluometuron Concentration Distribution in a Water-Saturated Soil: Experimental and Predicted Evaluation,
W74-08924 2G

The Endothermic Process--Application to Immobilization of Hanford In-Tank Solidified Waste,
W74-08968 5D

Water Loss from an Irrigated Sorghum Field: I. Water Flux Within and Below the Root Zone,
W74-09248 3F

SOIL WATER MOVEMENT
Application of the Green and Corey Method for Computing Hydraulic Conductivity in Hydrologic Modeling,
W74-09195 2G

Seismic Refraction Analysis of Watershed Mantle Related to Soil, Geology, and Hydrology,
W74-09199 2G

SOIL-WATER-PLANT RELATIONSHIPS
Cotton Leaf Temperatures as Related to Soil Water Depletion and Meteorological Factors,
W74-08755 3F

SOILS
Organic Management Reduces Leaching of Nitrate,
W74-08773 5G

Available Phosphorus Level Variations Occurring During the Reclamation of an Alkaline-Salty Soil (Variactiones Del Tenor De Fosforo Asimilable Durante La Recuperacion De Un Suelo Salino-Alcalino),
W74-08822 2G

Ge(Li) Low Level in Situ Gamma-Ray Spectrometer Applications,
W74-08886 5A

The Effect of Exclusion Volume on Potentiometric Nitrate Measurement,
W74-08919 2G

SOLAR DISTILLATION
Process and Apparatus for Solar Distillation Utilizing Cellular Ceramic Nodules to Improve the Evaporation Rate,
W74-09179 3A

SOLAR RADIATION
Light and Temperature Relations in a Small Desert Pond as Influenced by Phytoplanktonic Density Variations,
W74-08758 5C

Prediction of Dew Point Temperature, Solar Radiation and Wind Movement Data for Simulation and Operations Research Models,
W74-08933 2B

SOLID WASTES
Monitoring of Solid Wastes,
W74-09216 5A

SOLUTE TRANSPORT MODEL
Solution and Adsorbed Fluometuron Concentration Distribution in a Water-Saturated Soil: Experimental and Predicted Evaluation,
W74-08924 2G

SOLVENT EXTRACTIONS
Treatment of Sulfite Evaporator Cendensates for Recovery of Volatile Components,
W74-09066 5D

SORGHUM
Evaluation of Graded Furrow Irrigation with Length of Run on a Clay Loam Soil,
W74-08927 3F

Water Loss from an Irrigated Sorghum Field: I. Water Flux Within and Below the Root Zone,
W74-09248 3F

Water Loss from an Irrigated Sorghum Field: II. Evapotranspiration and Root Extraction,
W74-09249 3F

SOUTH CAROLINA
Environmental Dose Measurements in the Vicinity of Nuclear Facilities,
W74-08911 5A

Diversion of Water.
W74-09155 6E

County Sediment Control Programs.
W74-09157 6E

Pollution Control Facilities.
W74-09158 6E

Model Study of Trotters Shoals Spillway,
W74-09204 8B

SOUTH DAKOTA
Quantification of Pollutants in Agricultural Runoff,
W74-08942 5B

Seismic Refraction Analysis of Watershed Mantle Related to Soil, Geology, and Hydrology,
W74-09199 2G

SOUTHERN CALIFORNIA
Meeting Water Demands in the Chino-Riverside Area,
W74-09076 6D

SOUTHWEST U
A Climatology of Cumulus Seeding Potential for the Western United States,
W74-09222 3B

SOYBEANS
Yield Response of Soybean Varieties Grown At Two Soil Moisture Stress Levels,
W74-08805 3F

SPATIAL DISTRIBUTION
A Test of Combinations of Models for Projecting the Population of Minor Civil Divisions,
W74-09081 6B

SPAWNING
Early Life History and Feeding of Young Mountain Whitefish,
W74-08832 5C

SPECIATION
Terrestrial Ecology,
W74-09239 5C

SPECIFIC ION MONITORING
Specific Ion Mass Spectrometric Detection fo Gas Chromatographic Pesticide Analysis,
W74-08943 5A

SPECTRAL ANALYSIS
Development of Water Quality Models Usin Spectral Analysis and Parameter Estimatio Techniques,
W74-08936 5C

SPECTROMETERS
Ge(Li) Low Level in Situ Gamma-Ray Spec trometer Applications,
W74-08886 5A

Comparison of Ge(Li) and Anticomptor Systems for Measurements of Environmenta Samples,
W74-08887 5A

A Gamma-Ray Spectrum Analysis Technique for Low-Level Environmental Radionuclides,
W74-08888 5A

An Airborne Gamma Ray Spectrometer and Its Application in Nuclear Power Plant Site Surveys,
W74-08908 5A

SPECTRUM ANALYSIS
Statistical and Spectrum Analyses of Wind Waves on the Kayrakkum Reservoir (Statisticheskiy i spektral'nyy analizy vetrovogo volneniya na Kayrakkumskom vodokhranilishche),
W74-09110 2H

SPENT PICKLE LIQUOR
Sulfuric Acid and Ferrous Sulfate Recovery From Waste Pickle Liquor,
W74-08945 5D

SPILLWAYS
Model Study of Trotters Shoals Spillway,
W74-09204 8B

Hulah Dam Emergency Bulkhead Prototype Closure Tests,
W74-09205 8C

SPINACH
Reflectance, Transmittance, and Absorptance of Light By Subcellular Particles of Spinach (Spinacia oleracea L.) Leaves,
W74-08809 3F

SPRAY SOLIDIFICATION
Quarterly Progress Report -- Research and Development Activities Waste Fixation Program -- October Through December 1973.
W74-08965 5D

SPRINGFIELD (MASS)
Direct Filtration: An Economic Answer to a City's Water Needs,
W74-08788 5D

SPRINKLER IRRIGATION
Air Temperature and Vapor Pressure Changes Caused by Spinkler Irrigation,
W74-08757 3F

Controlled Sprinkler Irrigation System for Equalized Water Distribution Developed in Israel.
W74-08818 3F

Soil Crusting Related to Sprinkler Intensity,
W74-08844 3F

ST
Tale of Twin Cities, Cutting the High Costs of Pollution Control.
W74-08796 5D

Final Environmental Statement Related to Construction of St. Lucie Plant, Unit 2.
W74-08961 5C

STAGE-DISCHARGE RELATIONS
A Dynamic Method and Its Application to Investigations of Currents in Inland Bodies of Water (Dinamicheskiy metod i yego primeneniye dlya issledovaniy techeniy vo vnutrennikh vodoyemakh),
W74-09105 2H

STANDARDS
Effects of Pending Federal Drinking-Water Legislation,
W74-09147 6E

STATISTICAL METHODS
Statical Interpretation of Chemical Results from Drillholes as an Aid to Geothermal Prospecting and Exploitation,
W74-09014 4B

Statistical and Spectrum Analyses of Wind Waves on the Kayrakkum Reservoir (Statisticheskiy i spektral'nyy analizy vetrovogo volneniya na Kayrakkumskom vodokhranilishche),
W74-09110 2H

STATISTICAL MODELS
Water Quality Models Using the Box-Jenkins Method,
W74-09113 5B

Stochastic Model of Dynamic Eutrophic Estuary,
W74-09114 5B

Analysis of Natural Systems,
W74-09234 5C

STEEL
A Cost Analysis of Waste Management in the Steel Industry,
W74-09082 6B

STOCHASTIC PROCESSES
Predicting the Hydrologic Effects of Land Modifications,
W74-08753 4A

STOMATAL CONDUCTANCES
Effects of Various Water Regimes on Stomatal and Mesophyll Conductances of Bean Leaves,
W74-09247 3F

STORAGE
Northern Illinois Uses Storage Effectively,
W74-08909 4B

STORAGE TANKS
Review of Precast Prestressed Concrete Water Storage Reservoirs,
W74-08906 8F

STORM RUNOFF
Langford v. Kraft, Downing and Wooten Enterprises v. Kraft (Damage From Flood Runoff).
W74-09145 6E

STREAM POLLUTION
Stream Standards: Dead or Hiding,
W74-08866 5G

STREAM RECOVERY
The Recovery of Stream Macrobenthic Communities from the Effects of Acid Mine Drainage,
W74-08701 5C

STREAM STANDARDS
Stream Standards: Dead or Hiding,
W74-08866 5G

STREAMFLOW
Lake Powell Research Project: Hydrologic Research,
W74-08767 2H

STREAMS
Stream Standards: Dead or Hiding,
W74-08866 5G

Chlorine Residuals in Treated Effluents,
W74-08891 5C

STRIP MINING
Feasibility Study of a New Surface Mining Method 'Longwall Stripping,'
W74-09060 5G

STRONTIUM
Health and Safety Laboratory Fallout Program -- Quarterly Summary Report -- December 1, 1973 Through March 1, 1974,
W74-08954 5B

Health and Safety Laboratory Fallout Program -- Quarterly Summary Report -- December 1, 1973 Through March 1, 1974, (Appendix),
W74-08956 5A

Environmental Radioactivity in the Faroes in 1972,
W74-09086 5B

Environmental Radioactivity in Denmark in 1972,
W74-09087 5B

Environmental Radioactivity in Greenland in 1972,
W74-09088 5B

STRUCTURAL GEOLOGY
Photogrammetric Techniques Applied in the Development of Geothermal Resources in Matsukawa and Otake Geothermal Areas Using a Vector Method,
W74-09012 4B

SUBCRITICAL FLOW
A Comparative Estimate of Energy Losses in Water Bodies and in Tranquil and Turbulent Flows (Sravnitel'naya otsenka poter' energii v vodoyemakh, spokoynykh i burnykh potokakh),
W74-09109 2H

SUBSIDENCE
Ground Subsidence of a Geothermal Field During Exploitation,
W74-09010 4B

SUBSURFACE IRRIGATION
Dynamic Simulation of Automated Subsurface Irrigation Systems,
W74-08931 3F

SUGARCANE
Furrow Irrigation Criteria for Hawaiian Sugarcane,
W74-08932 3F

SULFATES
Effect of Mine Drainage on the Quality of Streams in Colorado, 1971-72,
W74-09228 5B

SULFITE LIQUORS
Treatment of Sulfite Evaporator Cendensates for Recovery of Volatile Components,
W74-09066 5D

SULFUR
Response of Subirrigated Hay Meadows to the Application of Nitrogen, Phosphorus, and Sulfur,
W74-08802 3F

SULFURIC ACID
Penetrability and Hydraulic Conductivity of Dilute Sulfuric Acid Solutions in Selected Arizona Soils,
W74-08765 2G

SUPPLEMENTAL IRRIGATION
Effect of Supplemental Water on Barley and Corn Production in a Subhumid Region,
W74-08803 3F

SURFACE FILMS
Investigation of Surface Films - Chesapeake Bay Entrance,
W74-08831 5A

SURFACE-GROUNDWATER RELATIONSHIPS
Digital-Computer Programs for Analysis of Ground-Water Flow,
W74-09115 2F

SURFACE IRRIGATION
Trickle Irrigation -- Application Uniformity from Simple Emitters,
W74-08918 3F

SURFACE MINING
Feasibility Study of a New Surface Mining Method 'Longwall Stripping,'
W74-09060 5G

SURFACE RUNOFF
Ditch v. Hess (Action to Restore Free Flow of Surface Water).
W74-09130 6E

Langford v. Kraft, Downing and Wooten Enterprises v. Kraft (Damage From Flood Runoff).
W74-09145 6E

SURFACE WATERS
Water Resources Data for Georgia, 1973.
W74-09116 7C

SURFACTANTS
The Development of Phosphate Free Heavy Duty Detergents,
W74-08830 5C

SURVEILLANCE PROGRAM
Radiological Surveillance Around Turkey Point, 1970-1971,
W74-08970 5A

Radiation Data -- Section II, Water.
W74-08972 5A

SURVEYS
Household Wastewater Characterization,
W74-08770 5B

1973 Irrigation Survey.
W74-08817 3F

Environmental Management and Local Government,
W74-08827 6E

Instrumentation and Environmental Radiation Assessment Systems,
W74-08876 5B

Aerial Radiological Measuring Survey of the Area Surrounding the Dresden Nuclear Power Station, Morris, Illinois, September 1968,
W74-09250 5A

SURVIVAL RATES
Survival of Some Pelagic Copepods of the Black and Mediterranean Seas in Water of Different Salinity, (Vyzhivanie nekotorykh pelagicheskikh kopepod Chernogo i Vredizemnogo morei v vode razlichnoi solenosti),
W74-08725 5C

SUSPENDED SOLIDS
Household Wastewater Characterization,
W74-08770 5B

Evaluation of a Rotating Disk Wastewater Treatment Plant,
W74-08869 5D

Chemical/Physical and Biological Treatment of Wool Processing Wastes,
W74-09064 5D

SUTHERLAND RESERVOIR (NEB)
A Fossil Plant Environmental Impact Study,
W74-08874 5C

SWAMPS
Biocoenoses of the Palustrine Bodies of Water of the Southern Part of the Lake Onega-White Sea Watershed, (In Russian),
W74-09127 5C

SWEDEN
The Investigation of Biodegradability of Branched Nonyl Phenol Ethoxylates,
W74-08798 5D

SYMBIOSIS
Infestation of the Copepod Acartia Tonsa with the Stalked Ciliate Zoothamnium,
W74-08720 5C

SYSTEMS ANALYSIS
Design of Cost-Effective Water Quality Surveillance Systems,
W74-08825 5A

Evaluating Water Reuse Alternatives in Water Resources Planning,
W74-08940 5D

Analysis of Natural Systems,

Thermal Waters as a Source for Extraction of Chemicals,
W74-09038 2K

Technical-Economic Estimation of Geothermal Resources,
W74-09044 6B

Problems of the Regime and Investigation of Lakes and Reservoirs (Voprosy rezhima i issledovaniya ozer i vodokhranilishch),
W74-09100 2H

A Dynamic Method and Its Application to Investigations of Currents in Inland Bodies of Water (Dinamicheskiy metod i yego primeneniye dlya issledovaniy techeniy vo vnutrennikh vodoyemakh),
W74-09105 2H

A Comparative Estimate of Energy Losses in Water Bodies and in Tranquil and Turbulent Flows (Sravnitel'naya otsenka poter' energii v vodoyemakh, spokoynykh i burnykh potokakh),
W74-09109 2H

Volume of Water in Rivers, Lakes, and Reservoirs of the Soviet Union (Ob''yem vody v rekakh, ozerakh i vodokhranilishchakh Sovetskogo Soyuza),
W74-09111 2H

Water Balance of World Lakes and Reservoirs (Vodnyy balans ozer i vodokhranilishch zemnogo shara),
W74-09112 2H

Benthos in Arakum Bodies of Water, (In Russian),
W74-09142 5C

USSR (ARAL SEA)
Lacustrine Salt Deposits Under Present-Day Sediments of the Aral Sea (Solyanyye ozernyye otlozheniya pod sovremennymi osadkami Aral'skogo morya),
W74-08712 2H

USSR (BALTIC SEA REGION)
Estimation and Mapping of Rates of Exchange of Fresh Groundwater in the Baltic Artesian Basin (Otsenka i kartirovaniye tempov vodoobmena presnykh podzemnykh vod (na primere Pribaltiyskogo artezianskogo basseyna)),
W74-08705 2F

USSR (BELORUSSIA)
Forecasting Changes in Water Balance Under Influence of Human Activity (Prognozirovaniye izmeneniy vodnogo balansa pod vliyaniyem khozyaystvennoy deyatel'nosti),
W74-08709 4A

USSR (CARPATHIANS REGION)
Thermal Fields of the Eastern Carpathians,
W74-08984 2F

USSR (CAVEASUS)
Utilization of Thermal Waters from Oil Deposits of the Caucasus,
W74-08988 4B

USSR (DAGESTAN-MONTANE)
The Birchwoods of Montane Dagestan (In Russian),
W74-09232 4A

USSR (DONETS BASIN)
Effects of Ice Formation on the Salt Regime of a Reservoir (Vliyaniye ledoobrazovaniya na solevoy rezhim vodokhranilishcha),
W74-08704 2C

USSR (GEORGIA)
Thermal Waters of Georgia,
W74-08987 2F

USSR (KAKHOVKA RESERVOIR)
Depth Distribution of Water Temperature in the Kakhovka Reservoir (Raspredeleniye temperatury vody po glubine v Kakhovskom vodokhranilishche),
W74-09107 2H

USSR (KAMCHATKA)
Recent Hydrothermal Systems of Kamchatka,
W74-08989 2F

USSR (KAYRAKKUM RESERVOIR)
Statistical and Spectrum Analyses of Wind Waves on the Kayrakkum Reservoir (Statisticheskiy i spektral'nyy analizy vetrovogo volneniya na Kayrakkumskom vodokhranilishche),
W74-09110 2H

USSR (LAKE BAIKAL)
Vertical Distribution of Microbial Plankton in Southern Part of Lake Baikal in 1969, (In Russian),
W74-08870 5C

Daily Vertical Distribution of Winter Zooplankton in the Pelagic Zone of Lake Baikal, (in Russian),
W74-09074 5C

USSR (LAKE BAYKAL)
Water Balance of Lake Baykal (Vodnyy balans oz. Baykal),
W74-09101 2H

Refinement of the Precipitation Amount as Applied to Calculation of Water Balance of Lake Baykal, (Utochneniye velichiny osadkov primenitel'no k raschetu vodnogo balansa oz. Baykal),
W74-09102 2H

Results of On-site Investigations of Currents in the Southern Part of Lake Baykal (Rezul'taty naturnykh issledovaniy techeniy v yuzhnom Baykale),
W74-09103 2H

Problem of the Processes of Internal Water Exchange and Turbulence in Lake Baykal (K voprosu o protsessakh vnutrennego vodoobmena i turbulentnosti na oz. Baykal),
W74-09104 2H

USSR (LAKE GEK-GEL')
Thermal Characteristics and Vertical Exchange in Meromictic Lakes as Illustrated by Lake Gek-Gel' (Termicheskiye osobennosti i vertikal'nyy obmen v meromikticheskikh ozerakh na primere oz. Gek-Gel'),
W74-09108 2H

USSR (LAKE LADOGA)
Long-Term Characteristics of the Temperature Regime of Lake Ladoga (Mnogoletniye kharakteristiki temperaturnogo rezhima Ladozhskogo ozera),
W74-09106 2H

USSR (LAKE ONEGA-WHITE SEA)
Biocoenoses of the Palustrine Bodies of Water of the Southern Part of the Lake Onega-White Sea Watershed, (In Russian),
W74-09127 5C

USSR (MOZHAISK RESERVOIR)
Seasonal Changes of the Feeding of the Roach in the Mozhaisk Reservoir (In Russian),
W74-08762 2H

USSR (RIVER SVETUPE)
Native Infusoria of the River Svetupe in Summertime, (In Russian),
W74-08925 2I

USSR (SELENGA RIVER)
Problem of the Processes of Internal Water Exchange and Turbulence in Lake Baykal (K voprosu o protsessakh vnutrennego vodoobmena i turbulentnosti na oz. Baykal),
W74-09104 2H

USSR (SIBERIA)
Effect of Environmental Factors on Lake Zoobenthos in the Southern Part of Western Siberia (In Russian),
W74-09120 5C

USSR (TIEN-SHAN)
Vertical Differentation of Tien-Shan Torrents, Based on the Distribution of Characteristics of Water Insects, (in Russian),
W74-09063 2I

USSR (VILYUI RESERVOIR)
Formation of Gas Conditions in the Vilyui Reservoir, (In Russian),
W74-09162 5C

UTAH
Early Life History and Feeding of Young Mountain Whitefish,
W74-08832 5C

Pollution Effects on Adult Steelhead Migration in the Snake River,

UNION OF CONCERNED SCIENTISTS, CAMBRIDGE, MASS.
The Nuclear Fuel Cycle -- A Survey of the Public Health, Environmental and National Security Effects of Nuclear Power,
W74-08947 5C

Catastrophic Nuclear Accidents,
W74-08950 5C

UNION TANK CAR CO., CHICAGO, ILL. (ASSIGNEE).
Water Treating Apparatus,
W74-09189 5D

UNIVERSAL WATER CORP., SAN DIEGO, CALIF.
Application of Externally Wound Tubular Membrane Systems for Sea Water Desalination,
W74-08843 3A

UNIVERSITY OF SOUTH FLORIDA, TAMPA, FLA. DEPT. OF GEOLOGY.
Sedimentary Fluorite in Tampa Bay, Florida,
W74-08907 5A

UTAH STATE UNIV., LOGAN. CENTER FOR WATER RESOURCES RESEARCH.
Evaluating Water Reuse Alternatives in Water Resources Planning,
W74-08940 5D

UTAH STATE UNIV., LOGAN. DEPT. OF WILDLIFE SCIENCE.
Early Life History and Feeding of Young Mountain Whitefish,
W74-08832 5C

UTAH UNIV., OGDEN.
Accumulation of DDT by Aquatic Indicator Organisms,
W74-08716 5C

UTAH WATER RESEARCH LAB., LOGAN.
Comprehensive Management of Phosphorus Water Pollution,
W74-08826 5C

VERMONT UNIV., BURLINGTON. DEPT. OF GEOGRAPHY.
Survey of Lake Flooding from ERTS-1: Lake Champlain.
W74-09231 2H

VIRGINIA INST. OF MARINE SCIENCE, GLOUCESTER POINT.
Investigation of Surface Films - Chesapeake Bay Entrance,
W74-08831 5A

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG.
Stochastic Model of Dynamic Eutrophic Estuary,
W74-09114 5B

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. DEPT. OF BIOLOGY.
The Recovery of Stream Macrobenthic Communities from the Effects of Acid Mine Drainage,
W74-08701 5C

VIRGINIA UNIV., CHARLOTTESVILLE.
Impact of Beach Nourishment on Distribution of Emerita Talpoida, the Common Mole Crab,
W74-08894 5C

VOLCANI INST. OF AGRICULTURAL RESEARCH, BET DAGAN (ISRAEL).
Interacting Diffuse Layers in Mixed Mono-Divalent Ionic Systems,
W74-08920 2G

VSESOYUZNYI NAUCHNO-ISSLEDOVATELSKII INSTITUT VODOSNABZHENIYA, KANALIZATSII, GIDROTEKHNICHESKIKH SOORUZHENII I INZHENERNO GIDROGEOLOGII, MOSCOW (USSR).
Effects of Ice Formation on the Salt Regime of a Reservoir (Vliyaniye ledoobrazovaniya na solevoy rezhim vodokhranilishcha),
W74-08704 2C

VSESOYUZNYI NAUCHNO-ISSLEDOVATELSKII INSTITUT GIDROGEOLOGII I INZHENERNOI GEOLOGII, MOSCOW (USSR).
Types of Commercial Deposits of Thermal Underground Waters and Some Views on the Assessment of Their Reserves,
W74-08994 2F

WASHINGTON UNIV., SEATTLE.
Physical Transport of Trace Metals in the Lake Washington Watershed,
W74-09210 5B

WASHINGTON UNIV., ST. LOUIS, MO. CENTER FOR THE BIOLOGY OF NATURAL SYSTEMS.
Do Nuclear Plants Make Deadly Neighbors,
W74-09123 5G

WATER POLLUTION CONTROL CORP., MILWAUKEE, WIS. (ASSIGNEE)
Method for Installing Aeration Systems in Sewage Treatment Tanks,
W74-09176 5D

WATER POLLUTION CONTROL FEDERATION, WASHINGTON, D.C. TECHNICAL SERVICES.
The Need for an Indicator Virus in Water Quality Testing,
W74-08880 5A

WATER RESOURCES COUNCIL, WASHINGTON, D.C.
2 Objectives 4 Accounts,
W74-09154 6E

WESTINGHOUSE ELECTRIC CORP., PITTSBURGH, PA. (ASSIGNEE).
System for Treating Dilute Slurries,
W74-09188 5D

WIDEN (R. J.) CO., NORTH ADAMS, MASS.
A Tanner Looks at the Federal Water Pollution Control Act Amendments of 1972,
W74-08863 5G

WISCONSIN UNIV., MADISON.
How Well do Engineers Forecast Demands,
W74-08905 5G

WISCONSIN UNIV., MADISON. DEPT. OF SOIL SCIENCE.
Protocol for Evaluating the Nitrogen Status of Lake Sediments,
W74-09065 5C

WISCONSIN UNIV., MADISON. INST. FOR ENVIRONMENTAL STUDIES.
Environmental Impact Analysis: A Review of Three Methodologies,
W74-08839 6G

Quality of Life in Kickapoo Valley Communities,
W74-09068 6B

WISCONSIN UNIV., MADISON. WATER RESOURCES MANAGEMENT PROGRAM.
Hydrogeology is More Than a Classical Science,
W74-09090 2A

WISCONSIN UNIV., MILWAUKEE. SCHOOL OF ARCHITECTURE.
Flow Toward Periodic Title Drains,
W74-08923 2F

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MASS.
Marine Phytoplankton Vary in Their Response to Chlorinated Hydrocarbons,
W74-08728 5C

Marine Phytoplankton Vary in Their Response to Chlorinated Hydrocarbons,
W74-08730 5C

WORCESTER POLYTECHNIC INST., MASS. DEPT. OF MATHEMATICS.
Simulation of Dissolved Oxygen Profile,
W74-08823 5B

YALE UNIV., NEW HAVEN, CONN. OSBORN ZOOLOGICAL LAB.
The Production of Extracellular Carbohydrates by Some Marine Flagellates,
W74-08746 5C

ZURICH UNIV. (SWITZERLAND). INSTITUT FUER ALLGEMEINE BOTANIK.
Soil Respiration in Different Types of Southeast Asian Tropical Rain Forest, (In German),
W74-09246 2G

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 7, NUMBER 18
SEPTEMBER 15, 1974

W74-09251 -- W74-09800

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $45 (domestic), $56.25 (foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 7, NUMBER 18
SEPTEMBER 15, 1974

W74-09251 -- W74-09800

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

CALIBRATION OF U.S. GEOLOGICAL SURVEY RAINFALL/RUNOFF MODEL FOR PEAK FLOW SYNTHESIS--NATURAL BASINS,
Geological Survey, Reston, Va.
P. H. Carrigan, Jr.
Available from NTIS, Springfield, Va. 22151 as PB-226 217 - Price $3.00 printed copy; $1.45 microfiche. Computer Contribution Report, September 1973. 109 p, 2 fig, 2 tab, 5 ref.

Descriptors: *Computer programs, *Calibrations, *Mathematical models, *Rainfall-runoff relationships, Peak discharge, Floods.

This program determines the parameters of a rainfall-runoff model which is used to synthesize flood peaks. The calibration is based on short-term (about 5 years) records of daily rainfall, of daily evaporation, of unit rainfall (rainfall during an interval of usually 5 to 60 minutes), and of unit discharge. The method of calibration is similar to a least squares determination of coefficients in regression analysis. The calibration adjusts 10 parameters to seek the minimum mean square error in estimating surface runoff volume and flood peak magnitude. The user may select which of 10 parameters are to be adjusted, which of the events in the list of flood peaks are to be used for calibration, and the particular mean square errors to be minimized (runoff volume, peak discharge, or both). The printed output identifies the records used for calibration, indicates periods of record and dates of events, provides comparison of observed and synthetic surface runoff volumes and peaks, and tabulates parameters and mean square errors at progressive stages in the calibration process. WATER--A PRIMER,
California Univ., Berkeley.
L. B. Leopold.
W. H. Freeman and Company, San Francisco, Calif, 1974. 172 p.

Descriptors: *Hydrology, *Hydrologic cycle, Surface waters, Groundwater, Precipitation(Atmospheric), Streamflow, Water chemistry, Water quality, Floods, Soil-water-plant relationships, Soil water, Soil moisture, Water utilization, Evapotranspiration.

This short book is designed to cover the general principles of hydrology and the facts concerning water use that must precede consideration of the impact on the environment of man's use of the water resource. The environmental effects of resource use cannot be understood without knowledge of the occurrence and movement of water. (Knapp-USGS)

INDEPENDENT COMPARISON OF THREE URBAN RUNOFF MODELS,
Monash Univ., Clayton (Australia). Dept. of Civil Engineering.
D. P. Heeps, and R. G. Mein.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY7, Paper 10685, p 995-1009, July 1974. 6 fig, 4 tab, 18 ref, 2 append.

Descriptors: *Urban runoff, *Urban hydrology, *Storm runoff, Mathematical models, Rainfall-runoff relationships, Urbanization, Urban drainage.
Identifiers: *Australia.

Three urban runoff models (the Road Research Laboratory hydrograph method, the Storm Water Management Model, and the Cincinnati Urban Runoff Model) were applied to two urban catchments in Australia. The Road Research Laboratory method generally performed well if runoff from previous areas was insignificant. The Storm Water Management Model was best of the three models but also required the most computer time. The Cincinnati Urban Runoff Model contained several deficiencies which caused poor performance. Degree of catchment subdivision was an important factor in the magnitude of the peak predicted. (Knapp-USGS)

AN INVESTIGATION OF THE MICROPHYSICAL AND MICROMETEOROLOGICAL PROPERTIES OF SEA FOG, FIRST SUMMARY REPORT, PROJECT SEA FOG,
Calspan Corp., Buffalo, N.Y.
E. J. Mack, R. J. Pilie, and W. C. Kocmond.
Available from NTIS, Springfield, Va. 22151 as AD-767 376 Price $3.00 printed copy; $1.45 microfiche. Technical Report No CJ-5237-M-1, May 1973. 40 p, 12 fig, 2 tab, 11 ref, append. Navy Contract N00019-73-C-0094.

Descriptors: *Fog, *Meteorology, *Cloud physics, Weather, Climatology, *California, Clouds, Water temperature, Data collections, Instrumentation.

The microphysical and micrometeorological characteristics of two fogs occurring at sea 30 nmi off the coast of California were measured. The fogs exhibited formation features, vertical temperature structure and microphysical characteristics similar to those observed on shore in California coastal fog. One of the fogs formed over cold water, while the other formed over relatively warm water; in each instance, marked visibility improvements were observed at the surface downwind of abrupt gradients in surface water temperature. Fog occurrence at the surface at distances exceeding 30 nmi off shore is definitely a diurnal effect; radiational cooling at the top of the fog is much more important than has been previously considered. (Knapp-USGS)

SOME STATISTICAL ANALYSES OF HAWAIIAN RAINFALL,
Hawaii Univ., Honolulu. Water Resources Research Center.
E. D. H. Cheng, and L. S. Lau.
Available from the National Technical Information Service as PB-233 674, $3.75 in paper copy, $1.45 in microfiche. Technical Report No 72, August 1973. 63 p, 10 fig, 12 tab, 15 ref, 2 append. OWRR A-029-HI(1). 14-01-0001-3011.

Descriptors: *Hawaii, Watersheds(Basins), *Regression analysis, Rainfall, Rain gages, Precipitation(Atmospheric), Stability, Variability, *Rainfall intensity, Cloudbursts, *Statistical methods.
Identifiers: *Oahu(HI).

Monthly rainfall data of several stations in Kalihi Basin, Manoa Basin, and Kaneohe Area, all on Oahu, and the central sloping area of Molokai were correlated to watershed parameters of the areas. Distance measured from the station to a common station located seaward from all stations has proven to be the most important of the three parameters studied, the other two being the exposure and the elevation of the area. Both linear and nonlinear regression functions were developed. The central tendency of the monthly rainfall for the high rainfall part of the southeastern part of the Island of Oahu was found to require approximately forty years of record to stabilize. The analysis also shows that mean converges to a specified level generally faster than median. The intensity-duration relation of intense rain for specified recurrence interval for the high rainfall part of the Manoa Basin portrays accurately an inverse straight-line relationship on a plot of log-log coordinates, suggesting extension of effort to other climatically widely different regions in Hawaii. The developed relation agrees well with the reported finding of a prior Weather Bureau study employing a different approach.
W74-09655

2C. Snow, Ice, and Frost

SNOW SURVEY AND VEGETATION GROWTH IN HIGH MOUNTAINS (SWISS ALPS),
Zurich Univ. (Switzerland). Geographisches Institut.
H. Haefner.
Available from NTIS, Springfield, Va. 22151 as N73-23446, Price $3.00 printed copy; $1.45 microfiche. Progress Report to National Aeronautics and Space Administration, 1973. 13 p.

Descriptors: *Remote sensing, *Snow cover, *Alpine, Photogrammetry, Europe, Satellites(Artificial), Aerial photography, Mapping, Snow surveys.
Identifiers: ERTS.

A method for mapping snow over large areas combines ERTS satellite remote sensing to evaluate the exact density level of the snow cover for each individual image (or a selected section of the photo) with the higher resolution of aerial photographic techniques. Bands 4 and 5 provide the most accurate results for mapping snow. Using all four bands a separation of an old melting snow cover from a new one is possible. Regional meteorological studies combining data from ground observation, vertical temperature and humidity profiles, weather maps and meteorological satellite pictures with ERTS images describe the synoptical evolution of mesoscale and microscale meteorological systems over the Alps. (Knapp-USGS)
W74-09320

SYMPOSIUM ON THE HYDROLOGY OF GLACIERS,
Proceeding of Symposium held September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, 1973. 262 p.

Descriptors: *Glaciohydrology, *Hydraulics, *Melt water, Glaciers, Glaciology, Conferences, Infiltration, Percolation, Water yield, Water circulation, Melting, Freezing, Movement, Porous media.

An international conference was held on the hydrology of glaciers. The intention was to focus attention on those problems of glaciers in which water plays a dominant part. In the ablation zone of a glacier during the melt season streams of water flow over its surface. These streams often disappear from view into the depths of the glacier, and water from melting snow percolates downwards through the snow; and at the end of the glacier water is seen to emerge from the ice, often in the form of a single large stream. Streamflow derived from glaciers is an important resource because it is large in volume for unit area of catchment because it comes from places where precipitation is high or where snow is trapped efficiently, and it is highest in hot summers when the need is greatest. Because glacier streamflow originates at high altitudes it allows efficient generation of hydroelectric power. The use of this source of water requires understanding of the hydraulics and hydrology of glaciers. (See also W74-09326 thru W74-09349) (Knapp-USGS)
W74-09325

THE PRODUCTION, FLOW AND DISTRIBUTION OF MELT WATER IN A GLACIER TREATED AS A POROUS MEDIUM,
Geological Survey, Tacoma, Wash.
W. J. Campbell, and L. A. Rasmussen.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 11-27, 1973. 13 fig, 9 ref.

Descriptors: *Glaciohydrology, *Melt water, *Groundwater movement, Glaciers, Water balance, Water yield, Unsteady flow, Simulation analysis, Ablation, Mathematical models, Snowpacks, Firn, Porous media.
Identifiers: *South Cascade Glacier.

The meltwater outflow of a glacier was studied in relation to its meteorological environment in South Cascade Glacier by devising a flow law for water movement within the glacier and devising a method to compute the ice-melt over the entire glacier surface for short time scales to obtain a realistic input. The glacier is assumed to be a porous medium in which a Darcy flow exists. This law is combined with the continuity equation for free surface flow to yield an equation which describes the flow and distribution of melt water for an arbitrarily shaped glacier for which the spatial and temporal melt-water input is known. This model was applied to South Cascade Glacier for August 11-16, a period in which the dominant part of the energy balance was radiative. The daily nonradiative melt and long-wave melt during the periods studied amounted to slightly less than one-third of the total melt. This was assumed to be constant and uniform over the glacier during the period modelled. The shape of the bed has a primary effect on the character of the outflow curve. For the actual bed the outflow curve closely resembles the observed outflow. The internal flow solutions show a multiple water transport wave. Although this model is based on a simple physical concept, it reasonably approximates the outflow from a real glacier and offers some ideas for the flow of water within the glacier. GLACIER DISCHARGE SIMULATION BY GROUND-WATER ANALOGUE,
Department of the Environment, Ottawa (Ontario). Inland Waters Branch.
L. Derikx.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 29-40, 1973. 6 fig, 1 tab, 11 ref, append.

Descriptors: *Glaciohydrology, *Melt water, *Groundwater movement, Glaciers, Canada, Water balance, Water yield, Unsteady flow, Simulation analysis, Ablation, Mathematical models, Snowpacks, Firn, Porous media.

To simulate discharge from a glacier, the drainage basin is considered analogous to a groundwater system. The daily input into the system is precipitation and water from melting snow and ice computed from meteorological data. Outflow rates are computed by use of methods originally derived for nonsteady groundwater flow. The daily discharge of a glacial stream is the output of a system operating by the linearized Boussinesq's equation with time-invariant boundary conditions. The parameter of the system is dependent on the type of glacier, time of year, climate, and probably the slope of the glacier surface. Data from Peyto Glacier, Alberta, Canada, for the ablation period 1968 were used to test the preliminary discharge-simulation model. (See also W74-09325) (Knapp-USGS)
W74-09327

ANALYSIS OF THE RUN-OFF AND FLOW ROUTING FOR A MOUNTAIN GLACIER BASIN,
Moscow State Univ., (USSR).
G. N. Golubev.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 41-50, 1973. 4 fig, 4 ref.

Descriptors: *Glaciohydrology, *Ablation, *Routing, Melt water, Runoff forecasting, Melting, Snowmelt, Firn, Water balance, Base flow, Hydrograph analysis.

The difference between the values of the inflow of melted ice or water on the surface of a glacier and the runoff for short periods of time is due to the stream-flow control by the glacier. The average basin lag is directly dependent on the area of a glacier. The stream-flow control of the firn area is greater than that of the glacier tongue, and the basin lag of the firn area is approximately ten times longer. This difference is due to the fact that day peaks are a result of runoff from the glacier tongue, and the base flow of the hydrograph is a result of runoff from the firn. For a period of time of sufficient duration, it is possible to calculate directly the runoff by ablation, disregarding the stream-flow control. Such a period of time is a function of the glacier area. For short periods of time, calculation of the glacier runoff is by ablation taking into account the stream-flow control. For this purpose three methods of calculation are suggested: (1) flood-wave routing, (2) the time-area-concentration curve, and (3) the unit hydrograph. (See also W74-09325) (Knapp-USGS)

W74-09328

WATER MOVEMENT THROUGH THE GORNERGLETSCHER,
Hull Univ., (England). Dept. of Geography.
G. R. Elliston.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 79-84, 1973. 3 fig, 3 tab, 1 ref.

Descriptors: *Glaciohydrology, *Water level fluctuations, Ablation, Melt water, Discharge(Water), Base flow, Stream gages, Glaciers, Glaciology, Melting.
Identifiers: *Switzerland(Gornergletscher).

On the river draining the Gornergletscher, a diurnal rhythm in water levels is superimposed upon a base flow whose volume varies more slowly. When summer snowfalls greatly reduce ablation and runoff, the diurnal rhythm disappears and there is a slower decline in the base flow over several days until bare ice reappears. Even when ablation is renewed at a high rate, the daily rhythm does not resume its former amplitude for several days until the base flow also recovers its former volume. The peak flow in the daily rhythm occurs earlier in the day as the summer progresses, and the time constant lessens during the ablation season. It is suggested that during the ablation season a large quantity of water is present in the body of the glacier in reservoirs which are continuously draining out but which are topped up intermittently by melt water. The rate of discharge of the main outlet depends upon the hydrostatic pressures in the reservoirs, and the diurnal rhythm is mainly a reaction to diurnal changes in the hydrostatic pressure. During the ablation season the reservoir exits are enlarged, enabling the rate of discharge to increase. (See also W74-09325) (Knapp-USGS)
W74-09329

VARIATIONS IN THE RELATION BETWEEN GLACIER DISCHARGE AND METEOROLOGICAL ELEMENTS,
Eidgenoessische Technische Hochschule, Zurich (Switzerland). Versuchsanstalt fuer Wasserbau und Erdbau.
H. Lang.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 85-94, 1973. 5 fig, 3 tab, 4 ref.

Descriptors: *Glaciohydrology, *Ablation, *Melt water, Water yield, Meteorology, Snow cover, Precipitation(Atmospheric), Regression analysis, Temperature, Discharge(Water), Glaciers.

For two glacierized drainage basins in the Swiss Alps (Aletschgletscher: 195 sq km drainage area, 67% glaciers; and Rosegletscher: 67sq km drainage area, 33% glaciers), some of the characteristics of the variations in the relation between discharge and meteorological elements which occur in the course of an ablation season were studied. The daily values of 4 years of records were treated by regression techniques with discharge as a dependent variable and air temperature, sunshine duration, vapor pressure and precipitation as independents. The ablation seasons were subdivided into four periods; each interval taken over the 4 years of records provided one sample. The results of the regression analysis clearly show the influence of the variable snow cover and its areal distribution for both drainage basins. The differences in the altitude distributions of total and of glacier area between the two drainage basins are reflected particularly by the correlation between discharge and temperature respectively to precipitation. The multiple correlation coefficients verify the vapor pressure as an important variable. The maximum in the correlation function of discharge and air temperature was taken to determine the mean delay in melt-water runoff; in the course of the ablation season the delay decreases from about 2-3 to about 1-2 d. A recession coefficient, calculated from mean daily variations of discharge from the Aletschgletscher basin, indicates a very significant decrease in runoff delay from June to July. W74-09330

RECORD OF TWO JOKULLHLAUPS,
British Columbia Univ., Vancouver. Dept. of Geology.
W. H. Mathews.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 99-110, 1973. 3 fig, 3 tab, 9 ref.

Descriptors: *Glaciohydrology, *Canada, *Discharge(Water), *Floods, Peak discharge, Lakes, Water levels, Glaciology.
Identifiers: *Jokullhlaups, Glacial outburst floods, Salmon Glacier(B C).

A record of two jokullhlaups, from Summit Lake, British Columbia, Canada, through Salmon Glacier was obtained from observations on falling lake levels, lake areas, and surface outflow, plus estimates of inflow. The rate of leakage through Salmon Glacier increased sharply with time, and seems related to the 3/2 power of the volume of water previously lost. The effective tunnel diameter in the ice at the end of the two jokullhlaups was 12.5-13 m. Development of a tunnel of this size by mechanical erosion is not in accord with the ratio of ice to water leaving the tunnel; instead enlargement by melting seems more likely. Only a part of the heat energy available from loss of hydraulic head seems to be needed to develop the tunnel. Water temperatures calculated for the overflow of the tunnel are, in general, consistent with this hypothesis. Sealing of the escape route for the water requires as little as 2 days. (See also W74-09325) (Knapp-USGS)
W74-09331

SUBGLACIAL LEAKAGE OF SUMMIT LAKE, BRITISH COLUMBIA, BY DYE DETERMINATIONS,
Department of the Environment, Ottawa (Ontario). Inland Water Branch.
D. Fisher.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 111-116, 1973. 3 fig, 2 tab, 10 ref.

Descriptors: *Glaciohydrology, *Canada, *Discharge(Water), *Floods, Peak discharge, Lakes, Water levels, Glaciology, Tracers, Dye releases.
Identifiers: Jokullhlaups, Glacial outburst floods, Salmon Glacier(B C).

Summit Lake, British Columbia, is dammed by Salmon Glacier and periodically drains catastrophically under the ice. In order to test for continuous leakage under the ice in the interval between the catastrophic discharges, fluorescent rhodamine dye was place in the lake. The dye was detected in the Salmon River below the glacier on each of three separate tests, and it was concluded that a continuous leak existed. From estimates of the velocity of the water, it was concluded that the water flowed along a plane approximately 2 mm thick. An explanation of the emptyings is related to the glacier's water content. (See also W74-09325) (Knapp-USGS)
W74-09332

SOME VIEWPOINTS ON THE INTERNAL DRAINAGE OF GLACIERS,
Uppsala Univ. (Sweden). Dept. of Physical Geography.
T. Stenborg.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 117-129, 1973. 7 fig, 22 ref.

Descriptors: *Glaciohydrology, *Melt water, *Ablation, Streamflow, Runoff, Drainage, Melting, Groundwater movement, Porous media.
Identifiers: *Internal drainage(Glaciers).

The superficial systems of oblique tensile crevasses on a glacier tongue will lead to a division of the drainage, which on the two glaciers studied, persists down to the frontal streams. The general possibilities and conditions for this model with two quite separate internal drainage systems are discussed in relation to the glaciers studied and with reference to similar glacier tongues in general. Some possibilities of drainage penetration are also discussed from a theoretical point of view. A general model involves the mutual influences of superficial and internal drainage, glacier movement and runoff. The beginning of the summer is characterized by some melting, small amounts of runoff, a high ice velocity influenced by the increasing storage of water in and under the glacier. Then the internal drainage develops under the influence of the frequent crevassing and wastage of the snow and superimposed ice that have blocked the old drainage courses superficially. Runoff often reaches its summer maximum at this time. From the further development of drainage courses, higher rates of runoff recession follow, the temporarily stored water is gradually drained, and the ice velocity decreases during the rest of the summer. (See also W74-09325) (Knapp-USGS)
W74-09333

GEYSER-LIKE WATER SPOUTS AT WERENSKIOLDBREEN, SPITSBERGEN,
Wrocfawski Univ. (Poland). Inst. of Geography.
S. Baranowski.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 131-133, 1973. 2 fig, 6 ref.

Descriptors: *Glaciohydrology, *Discharge(Water), Water pressure, Movement, Flow, Freezing, Melt water.
Identifiers: *Spitsbergen, Werenskioldbreen.

Enormous water spouts were observed on Werenskioldbreen, a glacier in Spitsbergen, at noon on July 28, 1957. They appeared in regular cycles resembling geyser water eruptions. Each cycle of nearly 3 min duration started with a strong burst of water (60 m in height), after which the next three or four increasingly smaller spouts occurred at intervals of 8-10 s. The water spouts were related to the rainfall and the strong ablation that had taken place during the previous night. Large volumes of water that ran off the glacier surface and penetrated to the glacier bed were probably dammed on their way to the snout of the glacier by the cold ice of the glacier peripheral zone. As a result of this, a subglacial lake with gradually increasing hydrostatic pressure was formed, the pressure eventually causing a crack. Part of the water was forced into the crack. Due to ice pressure, the fissure tended to close either at the base or near the surface of the glacier, thus causing the breaks in the spout of one cycle. (See also W74-09325) (Knapp-USGS)
W74-09334

CAN A WATER-FILLED CREVASSE REACH THE BOTTOM SURFACE OF A GLACIER,
Northwestern Univ., Evanston, Ill. Dept. of Materials Science.

J. Weertman.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 139-145, 1973. 6 fig, 7 ref, append.

Descriptors: *Glaciers, *Rheology, *Melt water, *Glaciohydrology, Creep, Deformation, Glaciology.
Identifiers: *Crevasses(Glacial).

A crevasse filled with water up at least 97.4% of its depth can penetrate to the bottom of a glacier. Water-filled cavities can exist directly beneath water filled crevasses. The pressure of water pushing against the walls of the crevasse acts as wedge force to cause further penetration into the glacier. (See also W74-09325) (Knapp-USGS)
W74-09335

GLACIAL ORIGIN OF PRO-GLACIAL BOULDERS,
Newcastle-upon-Tyne Univ. (England). Dept. of Geography.
H. Lister.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 151-155, 1973. 6 fig, 1 tab, 5 ref.

Descriptors: *Deposition(Sediments), *Sediment transport, *Glaciohydrology, Velocity, Melt water, Particle size, Boulders, Glaciers, Glacial sediments.
Identifiers: *Pro-glacial boulders.

The size of cobbles and boulders in pro-glacial streams indicates the stream velocity required to transport them. This velocity is generally greater than the existing channel shape can accommodate. Deposition of supraglacial debris is adequate explanation of the presence of these boulders only where adjacent to medical moraines. Subglacial deposition is the only apparent alternative. This progression is demonstrated by analysis of data from Vestspitsbergen and Sweden. Results indicate discrete, though temporary, subglacial channels. (See also W74-09325) (Knapp-USGS)
W74-09336

HYDROLOGY OF THE INTERGRANULAR VEINS IN A TEMPERATE GLACIER,
Bristol Univ. (England). H. W. Wills Physics Lab.
J. F. Nye, and F. C. Frank.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 157-161, 1973. 3 fig, 2 tab.

Descriptors: *Glaciohydrology, *Porous media, Pores, Saturated flow, Melt water, Permeability, Groundwater movement, Ice, Cryology, Leaching, Solutes.
Identifiers: *Intergranular veins(Glacial).

Pore space in glacial ice was analyzed by using surface-energy considerations together with measurements of dihedral angle. In pure polycrystalline ice in equilibrium at the melting point the water phase is situated in channels at three-grain intersections. The channels join together in fours at the four-grain intersections in tetrahedra having concave non-spherical faces. This implies that ice at the melting point is permeable to water. A temperature glacier is filled with a three-dimensional network of veins of water between the grains. The water flows downwards, replenished by melt water from the surface and by melt produced by heat of deformation within the glacier, at a rate that depends on the fractional volume occupied by the water. This can adjust itself to carry the flow supplied; kinematic waves with sharp shock fronts will therefore be possible. The most important function of the vein system may be that it provides an efficient means of flushing impurities into and out of the glacier. (See also W74-09325) (Knapp-USGS)
W74-09337

VELOCITY FLUCTUATIONS AND WATER REGIME OF ARCTIC VALLEY GLACIERS,
Axel Heiberg Expedition, Montreal (Quebec).
F. Muller, and A. Iken.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 165-182, 1973. 8 fig, 4 tab, 26 ref, append.

Descriptors: *Glaciers, *Movement, *Glaciohydrology, *Canada, Arctic, Melt water, Rheology, Ablation, Water balance, Temperature, Water circulation, Discharge(Water).

Surface movement, ablation and, to some extent, runoff were measured in the ablation are of cold valley glaciers, particularly White Glacier on Axel Heiberg Island (lat. 80% N.) in the Canadian Artic Archipelago from 1959 to 1969. The annual, seasonal and short-period velocity fluctuations were most strongly linked to the discharge capacity of the drainage system. However, changes in glacier thickness, ice temperature near the bed, and longitudinal stress gradient are also influential. Intraglacial, water-activated glide planes were observed. (See also W74-09325) (Knapp-USGS)
W74-09338

JERKY GLACIER MOTION AND MELT WATER,
Ohio State Univ., Research Foundation, Columbus. Inst. for Polar Studies.
R. P. Goldthwait.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 183-188, 1973. 2 fig, 1 tab, 12 ref.

Descriptors: *Glaciers, *Movement, *Melt water, Rheology, Faults(Geologic), Pores, Crystallography, Creep.

Jerky motion was found in 5 glaciers. Jerky quick-slip motion was found only in the upper surface of the ice. Instantaneous surface slips measured 0.1 to 15 mm and the intervals between measurable slips are 5 to 529 min. The magnitude of displacement increases with increased time interval. The mechanism causing these displacements seems to be fault slip where the shear stress exceeds the strength of less ductile surface ice. Longer-term velocities (0.2-50 mm/h) accelerate in long sunny periods or heavy rain periods and especially during the summer high-energy period. Motion at the bottom of temperate (Casement Glacier) or cold (Meserve Glacier) glaciers was smooth, not jerky, even where basal slip was the manner of displacement. Where there were jerky motions at the surface, they are somewhat more intense in late evening or early morning of bright or sunny days. Motion of this sort leads to the hypothesis that jerky surficial motion is caused by water development at crystal boundaries and pore-pressure changes akin to those now throught to produce earthquakes. W74-09339

WATER AT THE BED OF A GLACIER,
Bristol Univ. (England). H. W. Wills Physics Lab.
J. F. Nye.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 189-194, 1973. 3 fig, 8 ref, append.

Descriptors: *Glaciohydrology, *Erosion, Scour, Melt water, Freezing, Melting, Ice, Cryology, Discharge(Water).

The melt water at the bottom of a temperature glacier, or at the bottom of a cold glacier or ice sheet that has a temperature base, is in channels, rather than in a continuous film; a consideration of the relative permanence of these channels leads to the conclusion that, while there may be temporary channels incised upwards into the ice, there will be comparatively permanent channels cut downwards into the rock bed. (See also W74-09325) (Knapp-USGS)
W74-09340

SEASONAL VARIATIONS IN THE TRITIUM ACTIVITY OF RUN-OFF FROM AN ALPINE GLACIER (KESSELWANDFERNER, OETZTAL ALPS, AUSTRIA),
Innsbruck Univ. (Austria). Dept. of Physics.
W. Ambach, H. Eisner, and M. Url.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 199-204, 1973. 3 fig, 3 ref.

Descriptors: *Tracers, *Melt water, *Ablation, *Glaciohydrology, *Tritium, Firn, Snowmelt, Rainfall, Water balance, Ice, Springs, Radioactivity techniques.

Runoff water of a glacier consists of components of different origins: melted snow (in some cases firn layers deposited during previous years), melted old glacial ice, spring-water, and rain. Water from melted snow differs from that of old glacial ice in having comparatively high tritium values. For this reason, there is a significant decrease in radioactivity of melt water from the ablation area during the summer ablation period. Diurnal variations of activity were also measured. (See also W74-09325) (Knapp-USGS)
W74-09341

ON THE POSSIBILITY OF ARTIFICIAL CONTROL OF THE MASS BALANCE OF A PERENNIAL SNOW PATCH,
Nagoya Univ. (Japan). Water Research Lab.
K. Higuchi.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 207-212, 1973. 3 fig, 15 ref.

Descriptors: *Snowpacks, *Water balance, *Melting, Ablation, Glaciers, Glaciology, Insulation, Weather modification.
Identifiers: *Glaciers(Artificial).

A perennial snow patch develops during periods with much snow in winter and low temperature in summer and dissipates during periods with less snow and higher summer temperature. Therefore, a perennial snow patch would grow to a cirgue glacier if the accumulation could be increased and the ablation could be reduced when the dissipation of the snow patch would occur under natural climatic conditions. From field experiments it was concluded that sheets of polystyrene foam insulator were the best material to cover the snow surface in order to reduce melting. (See also W74-09325) (Knapp-USGS)
W74-09342

SIMPLE METHOD OF MEASURING THE AVERAGE AMOUNT OF WATER PRODUCED ANNUALLY BY MELTING OF ICE ON A GLACIER,
Water Survey of Canada, Ottawa (Ontario).
I. A. Reid, and W. S. B. Paterson.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge,

England: International Association of Scientific Hydrology Publication No 95, p 215-218, 1973. 1 fig, 4 ref.

Descriptors: *Ablation, *Melting, *Water balance, *Glaciers, *Glaciohydrology, Water yield, Melt water, Water storage, Ice, Water measurement.

In a glacier in a steady state, the amount of ice flowing through the cross-section at the equilibrium line in a year equals the total annual ablation in the ablation area. Also, at each point in the ablation area, the component of velocity perpendicular to the surface equals the thickness of ice lost in a year. These relations provide simple methods of estimating the average annual loss of ice from the ablation area. Data from Athabasca Glacier illustrate the methods. (See also W74-09325) (Knapp-USGS)
W74-09343

INFLUENCE OF CHANGES IN THE GLACIERZED AREA ON SUMMER RUN-OFF IN THE PORTE DU SCEX DRAINAGE BASIN OF THE RHONE,
Eidgenoessfische Technishe Hochschule, Zurich (Switzerland). Versuchsanstalt fuer Wasserbau und Erdbau.
P. Kasser.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 221-225, 1973. 4 fig, 1 tab, 6 ref.

Descriptors: *Glaciohydrology, *Runoff, *Melt water, Runoff forecasting, Temperature, Ablation, Water yield, Correlation analysis, Water balance, Hydrologic budget.
Identifiers: *Switzerland(Rhone River).

The glacierized area of the drainage basin of the Rhone represented 17.9% of the total area in 1876, 16.8% in 1916, 14.7% in 1955 and 13.6% in 1968. The influence of the change in the glacierized area on the runoff figures from April to September was demonstrated for the period 1915/55 by regression of the summer runoff figures on the winter precipitation, winter runoff, summer precipitation, summer temperatures and change of area. The partial coefficient of correlation for the change of area, r=0.384, is significant at level 98.9%. The regression coefficient of the change of area corresponds to a relationship of 10 degree days for the formation of 48 kg/sq m of water from melted ice, relative to the change of area, as against 55 kg/sq m obtained empirically from measurements on ablation stakes. The residuals of the regression equation, which takes no account of the change of area, shows a significant trend in the period 1916/68. This trend vanishes when the change of area is introduced as a variable or when its effect is eliminated by a relation between degree days and the formation of water from melted ice. (See also W74-09325) (Knapp-USGS)
W74-09344

ROLE OF ICE RUN-OFF IN THE WATER BALANCE OF THE MOUNTAIN AREA OF CENTRAL ASIA,
Akademiya Nauk SSSR, Moscow. Institut Geografii.
I. D. Tsigel'naya.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 227-230, 1973. 1 fig, 2 tab, 6 ref.

Descriptors: *Runoff, *Ice, *Melt water, Water balance, Hydrologic budget, Glaciers, Glaciohydrology, Water yield, Asia.
Identifiers: *USSR(Central Asia).

The ice runoff resources of the mountain areas of Central Asia are as follows: Uzbek SSR, 2.1 cu km; Tajik SSR, 16.0 cu km; and Kirgiz SSR, 12.4 cu km. Precipitation was estimated by the annual isohyetal maps in the glacial-nival zone at the boundary of the glacier reservoir. The ablation at this glaciological level is equal to the accumulation. The proportion of the ice constituent in the total mountain runoff in Central Asia ranges from 5% to 83%, with an average of 25-32%. (See also W74-09325) (Knapp-USGS)
W74-09345

HYDROLOGICAL REGIME OF GLACIERS IN THE ALAY RANGE, CENTRAL ASIA,
Sredneasiatskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Tashkent (USSR).
V. F. Suslov, and A. A. Akbarov.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 235-238, 1973. 1 fig, 2 tab, 5 ref.

Descriptors: *Glaciohydrology, Glaciation, Runoff, Melt water, Ice, Mountains, Water balance, Hydrologic budget, Snowmelt, Discharge(Water), Water yield, *Glaciers.
Identifiers: *USSR(Alay Range).

The main geographical regularity in the glacierization of the Alay range, USSR, is its gradual dimensional diminuation in a west to east direction. The altitude of the firn line and the location of glaciers increase in the same direction, while the vertical amplitude and degree of glacierization decrease. At the present time the areas of most of the glaciers in the Alay range are diminishing. A characteristic feature is the clear-cut relationship of all the glaciological and hydrological indices to the changing oroclimatic conditions within the range. The average total runoff from the glaciers of the Alay range is 33.2%. The proportion of runoff (derived from melting ice) in the annual river discharge is 16.8%. The proportion of melt water (derived from melting ice) in the rivers of the western part of the range is considerably smaller than in the rivers of the eastern part; this is explained by the greater amount of precipitation and later exposure of the surface of the glaciers from beneath the snow cover. The proportion of runoff from the melting of seasonal snow on the surface of glaciers decreases from west to east according to the precipitation decrease. The highest runoff from modulus of 0.085 cu m per sec has been observed in the western part of the range, whereas in its eastern part it may be as low as 0.018. The total discharge from the glaciers of the Alay range is 1.6 cu km, which is about 8% of the annual discharge of all the rivers of Central Asia. (See also W74-09325) (Knapp-USGS)
W74-09346

INFILTRATION AND RUN-OFF OF MELT WATER ON GLACIERS,
Institute of Geography, USSR Academy of Sciences, Moscow.
A. B. Bazhev.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 245-250, 1973. 2 fig, 2 tab.

Descriptors: *Melt water, *Infiltration, *Glaciohydrology, *Snowpacks, *Firn, Melting, Movement, Glaciology, Glaciers, Ice, Freezing.

Melt and rain-water infiltration into a firn pack was studied. In autumn at the beginning of snow accumulation a pit was dug and the old firn surface was marked with methyl dye. In spring before melting began, the pit was reopened and the pack structure was described in detail and its water content was evaluated by layers. This was done at regular intervals during the whole summer. Temperature changes were measured in an adjacent bore hole. From an average rate along the whole cross-section of 4.5 cm per day in the upper part, infiltration rate smoothly increases with depth reaching its maximum of 25 cm per day at the bottom of the snow pack. At the interface with the firn the rate sharply drops down almost to 2 cm per day. Deeper in the firn the rate curve has the nature of a sinusoid with an amplitude decreasing with depth. The curve of the change in the rate of infiltration front movement reflects the influence of two factors: cold storage and water content of the pack. Cold storage slows down the infiltration most in the upper part of the cross-section and its effect diminishes with depth. Water content suppresses the infiltration in the upper layers only slightly and in the lower ones to a much greater extent. Along with a rapid decrease of water permeability downward the infiltration rate becomes variable because of the occurrence of ice layers and lenses. Melt water on glaciers is not only the major source of warming the cold layers in the pack, but a considerable part remains in the firn in the liquid state until the autumn-winter freezing. At middle latitudes the layer of thick firn packs affected by infiltration processes is thicker, and they are more saturated with water. On the whole more melt water remains in a liquid state in winter at these latitutdes. The warmer the glacier regime, the greater the autumn-winter internal accumulation. W74-09347

ESTIMATION OF RUN-OFF FROM ANTARCTIC AND GREENLAND ICE SHEETS,
Akademiya Nauk SSSR, Moscow. Vsesoyuznyi Institut Nauchnoi i Teknicheskoi Informatsii.
K. S. Losev.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 253-254, 1973.

Descriptors: *Runoff, *Water balance, *Hydrologic budget, *Glaciers, *Antarctic, Icebergs, Glaciation, Glaciology.
Identifiers: *Greenland ice sheets.

The rate of calving the icebergs from the Antarctic ice sheet suggests that the estimates of ice loss which have been used in previous estimates of Antarctic mass balance are too low. A new estimate, based on three different methods, suggests that the combined output from Greenland and Antarctic ice sheets is more than 3000 cu km per year. The annual runoff from the Antarctic ice-sheet was calculated on the basis of mass balance, iceberg volume, and by comparison with Greenland. The three methods yield similar results. STRUCTURE AND INFERRED CIRCULATION OF SOUTH CASCADE LAKE, WASHINGTON, U.S.A.,
Geological Survey, Tacoma, Wash.
W. J. Campbell.
In: Proceedings of Symposium on the Hydrology of Glaciers, September 7-13, 1969, Cambridge, England: International Association of Scientific Hydrology Publication No 95, p 259-262, 1973. 3 fig, 2 ref.

Descriptors: *Limnology, *Thermal stratification, *Melt water, Lakes, Glaciers, Washington, Water circulation, Glaciohydrology, Water temperature.
Identifiers: *Washington(South Cascade Lake).

To elucidate the dynamic interplay between South Cascade Glacier and its terminal lake, a series of limnological measurements begun in 1966 include summer and winter profiles of temperature, oxygen concentration, and specific conductivity. In the summer, suspended sediment profiles were obtained, and the temperature structure of the epilimnion was measured in detail using thermistors, thermocouple probes, and infra-red

radiometers. In the summer an intense shallow epilimnion with a sharp thermocline is generated by the absorption of solar radiation by the highly turbid water. When this epilimnion persists throughout the summer the circulatory mode of the lake is dimictic; when it is transitory the mode is polymictic. In winter an inverse double thermocline is formed, with the oxygen-saturated glacier melt water flowing along the epilimnion at the ice bottom and out the lake, while the zone between the two thermoclines (10-30 m) is a region of slow return flow towards the glacier terminus or slow-moving convective cells. In the winter hypolimnion below 30 m depth apparently little motion occurs. (See also W74-09325) (Knapp-USGS)

GREAT LAKES ICE COVER, WINTER 1971-72,
National Ocean Survey, Detroit, Mich.
R. A. Assel.
Available from NTIS, Springfield, Va. 22151 as COM-73-11746, Price $5.25 printed copy; $1.45 microfiche. National Oceanic and Atmospheric Administration Technical Memorandum NOS LSC D 6, October 1972. 57 p, 46 fig, 2 tab.

Descriptors: *Ice cover, *Surveys, *Great Lakes, *Iced lakes, Lake Superior, Lake Huron, Lake Michigan, Lake Ontairo, Lake Erie, Lake ice, Aerial photography.

Ice cover was measured on the Great Lakes in the winter of 1971-72. Thirty-five ice charts were produced from data collected on 23 Lake Survey Center ice reconnaissance flights. In addition, five summary ice charts, illustrating ice distribution patterns for short intervals during the winter over the entire Great Lakes, were produced. The 1971-72 winter was severe on western Lake Superior and near normal throughout the remainder of the Great Lakes. Ice formation was reported November 10 in western Lake Superior at Duluth Harbor and along the perimeter of all the Great Lakes by the end of January. The period of maximum ice cover varied from the second week of February to the last week of March for individual lakes. During this time maximum ice cover was estimated to be as follows: Lakes Superior and Erie, 95%; Lake Michigan, 40%; Lake Huron, 70%; and Lake Ontario, 20%. Ice covers begin to decrease during March. Last reported ice ranged from May 5 for the lower lakes in the Niagara River to June 8 for the upper lakes in western Lake Superior. (Knapp-USGS)

AVALANCHE STUDIES IN THE SAN JUAN MOUNTAINS OF SOUTHWESTERN COLORADO,
Colorado Univ., Nederland. Inst. of Arctic and Alpine Research.
R. L. Armstrong.
Proceedings for sale by Western Snow Conference, R. T. Davis, Secretary, Rm. 360, U.S. Courthouse, Spokane, Wash. 99201 - Price $3.00. In: Proceedings of the 41st Annual Meeting of the Western Snow Conference, April 17-19, 1973, Grand Junction, Colorado: Colorado State University, Fort Collins, p 44-51, 1973. 2 fig.

Descriptors: *Avalanches, *Snowpacks, Snow, Snow cover, Instrumentation, Mountains, Topography, Colorado, Weather, Meteorology, Temperature.
Identifiers: *San Juan Mountains(Colo).

The causes of snow avalanches in the San Juan Mountains of southwestern Colorado were studied to develop a forecast model to predict avalanche occurrence. In addition, the project was designed to evaluate the possibilities of increased avalanche activity which could result from winter cloud seeding activities. The terrain onto which snow is deposited influences the snow stability in many ways. In terms of surface characteristics only, the maximum instability will probably develop on smooth, grassy slopes while maximum stability will be found on heavily forested slopes. Surface features, such as boulders and forest cover, which are higher than the mean thickness of the snow cover act as an anchor; an avalanche will normally not occur until such time as snow depth exceeds the mean height of such closely spaced surface irregularities. Widely spaced or isolated obstacles have little stabilizing effect. It is generally considered that a basic correlation between slope angle and avalanche frequency does exist. While they do occur, avalanches are rare on slopes greater than 60 deg and less than 25 deg. A strong relationship exists between the amount and type of snow cover that develops within a particular slide path and the orientation of the ridge system associated with the slide path. The orientation of the ridge with respect to the wind direction during a given storm will determine to a considerable degree the precipitation pattern of that storm in terms of the local topography. With the aid of USGS maps, the orientation of both the slide paths and associated ridge systems, as well as mean angles of the slide paths were established for the study area. Fixed instrumentation was utilized to measure meteorological parameters, determine snowpack depth, density, and stratigraphy, and to detect avalanche events. (Knapp-USGS)
W74-09607

SNOW SAMPLING TECHNIQUES ON A SMALL SUBALPINE WATERSHED,
Wyoming Univ., Laramie. Water Resources Research Inst.
L. R. Bartos, and P. A. Rechard.
Proceedings for sale by Western Snow Conference, R. T. Davis, Secretary, Rm. 360, U.S. Courthouse, Spokane, Wash. 99201 - Price $3.00. In: Proceedings of the 41st Annual Meeting of the Western Snow Conference, April 17-19, 1973, Grand Junction, Colorado: Colorado State University, Fort Collins, p 52-61, 1973. 9 tab, 5 ref.

Descriptors: *Snow surveys, *Snowpacks, *Water equivalent, Water yield, Runoff forecasting, Streamflow forecasting, Sampling, Water measurement.

The study was located in the Nash Fork Basin of the Snowy Range in southeastern Wyoming. The research was conducted on a watershed of 744 acres at elevations ranging from 10,200 to 10,600 feet above mean sea level. The areal mean water equivalent of snow on a watershed can be determined more precisely, with little increase in effort, by a transect of many snow depth measurements and few snow density measurements. It is possible to develop a close estimate of the water equivalent on a small watershed by means of such a transect. When measuring depths independently of densities, the relative number of depth to density samples required on the subalpine watershed studied was 2:1 in forested cover and 5:1 in the open wind-influenced area for each elevation. (Knapp-USGS)
W74-09608

A COMPARISON OF TECHNIQUES OF SAMPLING THE ARCTIC-SUBARCTIC SNOWPACK IN ALASKA,
Soil Conservation Service, Anchorage, Alaska.
A. G. Crook, and T. G. Freeman.
Proceedings for sale by Western Snow Conference, R. T. Davis, Secretary, Rm. 360, U.S. Courthouse, Spokane, Wash. 99201 - Price $3.00. In: Proceedings of the 41st Annual Meeting of the Western Snow Conference, April 17-19, 1973, Grand Junction, Colorado: Colorado State University, Fort Collins, p 62-68, 1973. 6 fig, 1 tab, 3 ref.

Descriptors: *Sampling, *Snow surveys, Water equivalent, Water yield, Stratigraphy, Snowpacks, Alaska.

Snowpack data are being gathered in Alaska by several procedures including CRREL observations and snow course surveys using Federal samplers. Values obtained by either method can be estimated using data from the other procedure. CRREL observations yield slightly higher density values than Bowman observations in light density snowpacks. The difference tends to diminish as density increases. Overmeasurement is a result, at least in part, of sampling strata of depth hoar crystals. Deeper snowpacks were characterized by higher densities and the fact that a smaller proportion of the profile has been metamorphosed to depth hoar crystals. The CRREL procedure overmeasure may be inversely proportional to density. The Bowman method offers a convenient, accurate, and reliable alternative for collecting snow depth and snow water equivalent and has a note-reduction procedure that allows for convenient onsite validity checks. The CRREL procedure gives a much more complete description of the stratigraphy of a snowpack. Onsite validity checks can be made most conveniently by routine replicate sampling within each horizon. Each procedure originated because of a specific need: CRREL to describe the profile and Bowman to determine water equivalent. Each is a well-suited method of collecting these data. (Knapp-USGS)
W74-09609

SNOW LOAD ANALYSIS AND RECREATIONAL USES OF SNOW DATA,
T. A. George, and D. W. McAndrew.
Proceedings for sale by Western Snow Conference, R. T. Davis, Secretary, Rm. 360, U.S. Courthouse, Spokane, Wash. 99201 - Price $3.00. In: Proceedings of the 41st Annual Meeting of the Western Snow Conference, April 17-19, 1973, Grand Junction, Colorado: Colorado State University, Fort Collins, p 69-74, 1973. 6 fig, 12 ref.

Descriptors: *Snow surveys, *Winter sports, *Loads(Forces), Snowpacks, Recreation, Sampling, Ice loads, Snow cover.
Identifiers: *Snow loads.

In any deep snow zone area that is having or expects considerable urban development, there is a definite need for snow load data. If basic data are not available from existing snow courses, short-term snow courses throughout the elevation range could be established. After a few years of record, these short-term courses may be correlated to other similar courses in the region with longer periods of record, and be used to determine snow loads. When a specific site is being contemplated for a winter recreation area, it is desirable to install a few short-term snow courses for snowpack evaluation of the area. The short-term records collected while the proposed area is in the feasibility study period can be compared directly with long-term data, thereby giving the short-term snow courses more reliability and more meaning. MEAN PRECIPITATION AND SNOWFALL MAPS FOR A MOUNTAINOUS AREA OF POTENTIAL URBAN DEVELOPMENT,
Atmospheric Environment Service, Vancouver, (British Columbia).
D. G. Schaefer, and S. N. Nikleva.

Proceedings for sale by Western Snow Conference, R. T. Davis, Secretary, Rm. 360, U.S. Courthouse, Spokane, Wash. 99201. Price $3.00. In: Proceedings of the 41st Annual Meeting of the Western Snow Conference, April 17-19, 1973, Grand Junction, Colorado: Colorado State University, Fort Collins, p 80-89, 1973. 6 fig, 3 tab, 4 ref.

Descriptors: *Snowfall, *Snow removal, *Urban hydrology, Planning, Cities, *Canada, Mapping, Precipitation(Atmospheric).
Identifiers: *Vancouver(BC).

As part of an environmental impact study, the climate of the mountainous areas north and west of Vancouver, Canada were studied to assess possible climatic limitations to urban development of the mountain slopes. A model of mean annual precipitation based upon available data and meteorological theory is presented. A mean annual snowfall map is derived in part from relationships between mean annual snowfall and mean annual precipitation at various altitudes. Implications for urban planning are discussed. (Knapp-USGS)

TELEMETERED PROFILING ISOTOPIC SNOW GAUGE: FINAL REPORT AND SPECIFICATIONS,
Aerojet Nuclear Co., Idaho Falls, Idaho.
P. D. Randolph, R. A. Coates, and E. W. Killian.
Available from NTIS, Springfield, Va 22151 as ANCR-1105 (TID-4500) Price $7.60 printed copy; $1.45 microfiche. Aerojet Nuclear Company Report ANCR-1105, April 1973. 123 p, 29 fig, 7 tab, 8 ref, 11 append. AEC Contract AT(10-1)-1375.

Descriptors: *Precipitation gages, *Snowpacks, *Telemetry, *Nuclear moisture meters, Water equivalent, Snowmelt, Data collections, Hydrologic data, Instrumentation.

A telemetered snow gage can be used to measure snow depth, snow density at one-half inch depth intervals through a snow pack, total water content, changes in water content, amount of new snow since last measurement, rainfall amount, and snow melt rate between measurements. It operates by measuring the attenuation by snow of gamma rays traveling a fixed distance between two vertical tubes. Four such gages are operated as a telemetered network from a central base station in Idaho. The base station uses a small data processor for gage control and data analysis. The field units are in Alaska, Oregon, Idaho and Colorado. Performance requirements are given for gage parts as well as complete mechanical and electronic drawings. A base station user's manual, a software description and a complete software listing are also includes. (Knapp-USGS)
W74-09757

2D. Evaporation and Transpiration

WATER LOSS ESTIMATES FROM A FALLOW SOIL,
South Dakota State Univ., Brookings. Dept. of Plant Sciences.
L. R. Stone, T. C. Olson, and M. L. Horton.
Journal of Soil and Water Conservation, Vol 28, No 3, p 122-124, May-June, 1973. 3 fig, 1 tab, 12 ref.

Descriptors: *Soil water movement, Soil moisture, Soil water, Fallowing, *Evapotranspiration, Percolation, Infiltration, Soils, Root zone, Hydraulic conductivity.
Identifiers: Hydraulic potential.

The magnitude and direction of soil water movement were determined daily for 50 days using tensiometers placed at eight depths in a fallow soil. Flux at the 150-centimeter (60-in) depth was determined using hydraulic potential data, unsaturated hydraulic conductivities, and soil-characteristic values. Daily evaporation rates were calculated as the difference between total water depletion in the 0- to 150-centimeter profile and water flux at the 150-centimeter depth. Flux at the 150-centimeter depth was downward throughout most of the 50-day period. This technique offers a means of determining water loss due to evaporation and percolation below the root zone in fallow soils. (Martino-NWWA)

EVAPORATION LOSSES OF WINDBLOWN SNOW, AND THE POTENTIAL FOR RECOVERY,
Rocky Mountain Forest and Range Experiment Station, Laramie, Wyo.
R. D. Tabler.
Proceedings for sale by Western Snow Conference, R. T. Davis, Secretary, Rm. 360, U.S. Courthouse, Spokane, Wash. 99201. Price $3.00. In: Proceedings of the 41st Annual Meeting of the Western Snow Conference, April 17-19, 1973, Grand Junction, Colorado: Colorado State University, Fort Collins, p 75-79, 1973. 3 fig, 3 ref, append.

Descriptors: *Evaporation, *Snowpacks, *Colorado, *Sublimation, Snow, Winds, Snow management.

A method was developed to estimate annual sublimation from snowpacks. In low-growing sagebrush lands at 8,000 ft elevation along a highway study area, the average annual sublimation loss would be about 2,800 cu ft of water-equivalent per foot of width perpendicular to the wind, or about 224 ac-ft per sq mi--about 52% of the average winter's total precipitation. There can be little doubt that sublimation of blowing snow is a major component of the hydrologic cycle in such an area. Theoretically, all of the transport sublimation loss could be recovered if barriers were spaced sufficiently close to eliminate blowing snow completely. (Knapp-USGS)

ENERGY FLUX STUDIES IN A CONFIEROUS FOREST ECOSYSTEM,
Oregon State Univ., Corvallis. Dept. of Forest Engineering.
L. W. Gay.
Available from Sup Doc, GPO, Washington, DC 20402 Price $2.50. In: Proceedings of Conference on Research on Coniferous Forest Ecosystems, March 23-24, 1972, Bellingham, Wash: Forest Service Pacific Northwest Forest and Range Experiment Station, p 243-253, 1972. 3 fig, 1 tab, 21 ref. OWRR A-010-ORE(8).

Descriptors: *Forests, *Ecosystems, *Energy budget, Solar radiation, Evapotranspiration, Energy transfer, Convection, Albedo, Cloud cover.

The fluxes of thermal energy between the atmosphere and a young Douglas-fir forest were measured during two contrasting summer days, one cloudless and one overcast. The energy budget components were evaluated by the Bowen ratio method, with ceramic-wick psychrometers at the 26.16 m, 28.16 m, or 31.16 m levels. The maximum height of the tallest trees was 28 m, and the general level at the top of the closed canopy was about 22 m. Daily totals of the energy budget components (cal per sq cm) under cloudless skies on July 29, 1971, were: solar radiation, 584; net radiation, 410; change in storage, 5; convection, -135; and latent energy, -280. The albedo was 0.09 on both the clear and the overcast day. Analysis of the overcast conditions of July 31, 1971, yielded the following values: solar radiation, 171; net radiation, 134; change in storage, 6; convection, -39; and latent energy, -102. HIGHWAYS AND THE CATASTROPHIC FLOODS OF 1972.
Highway Research Board, Washington, D.C.
Available from Highway Research Board, National Academy of Sciences, Washington, D.C. 20148, Price $2.20. Highway Research Record, No 479, 1973. 65 p.

Descriptors: *Floods, *Highways, *Design flood, *Disasters, Design, Risks, Conferences, Planning, Data collections, Flood data, Hydrologic data, Gaging stations, Damages.

Two conferences were devoted to the subject of the catastrophic floods that occurred in 1972 and the resulting impact on highway facilities. This material will be of interest to administrators, practicing engineers, and researchers interested in improving hydrologic analyses and hydraulic designs to minimize flood damage to transportation and other facilities. Not only did the record floods caused by Hurricane Agnes cause severe damage to highways in 1972, but numerous floods of significance occurred nationwide during the year. The papers presented discuss the hydrometeorological conditions associated with these floods and the part played by state and federal agencies in such emergencies. The comprehensive report on bridge damage due to Hurricane Agnes is included as a supplement to the proceedings. Debris was a primary cause or a significant contributing factor to bridge damage, and scour at the substructure was the other major cause. Other papers discuss recording, evaluating, and predicting extreme floods. A panel discussion on design criteria and the need for further research in such areas as improved methods of flood prediction and risk evaluation is included. (See W74-09391 thru W74-09400) (Knapp-USGS)
W74-09390

FLOODS OF 1972,
Geological Survey, Reston, Va.
D. M. Thomas.
Highway Research Record, No 479, p 1-4, 1973. 2 fig, 1 tab.

Descriptors: *Floods, *United States, Disasters, Historic floods, Flood data, Hurricanes, Storm runoff, Flood frequency, Dam failure, Seiches, Snowmelt, Weather, Meteorology.

During an average year floods in the U.S. claim about 100 lives and $1 billion in damage, but during 1972 the losses were four to five times that great. Although Hurricane Agnes caused severe fooding from North Carolina to New York, a variety of phenomena, including rainfall, snowmelt, ice jams, structural failures, and lake stages, caused flooding in Idaho, Washington, Oregon, Arizona, and other places. WEATHER SITUATIONS ASSOCIATED WITH FLOODS DURING 1972,
National Weather Service, Silver Spring, Md.
J. F. Miller.
Highway Research Record, No 479, p 5-11, 1973. 10 fig, 6 ref.

Descriptors: *Floods, *United States, Disasters, Historic floods, Flood data, Hurricanes, Storm runoff, Flood frequency, Dam failure, Seiches, Snowmelt, Weather, Meteorology, Weather.

Floods in the U.S. during 1972 resulted from a variety of meteorological causes, and some were only partially the result of extreme weather events. One flood that was not caused by a major weather event occurred on Buffalo Creek in West Virginia in February; and, although precipitation of moderate to heavy amounts occurred over a

fairly large area, the major flooding resulted primarily from dam failure. Of the other major flood events, one resulted from snowmelt during extremely warm periods, four resulted from isolated thunderstorm activity, three were the result of widespread precipitation associated with active frontal systems, one was the result of precipitation from a tropical storm, and one was the result of strong winds around the Great Lakes. HURRICANE AGNES-DAMAGE IN PENNSYLVANIA,
Pennsylvania State Dept. of Transportation, Harrisburg.
F. W. Bowser, and M. C. Tsai.
Highway Research Record, No 479, p 12-14, 1973.

Descriptors: *Floods, *Hurricanes, *Pennsylvania, *Damages, Historic floods, Highways, Bridges, Roads, Flood data.
Identifiers: *Hurricane Agnes(1972).

The Agnes flood levels of 1972 exceeded the previous record of 1936 by 3 to 6 ft in the Susquehanna River. At Wilkes-Barre, Pennsylvania, the river crested 18 ft above flood stage. The Schuylkill River in southeastern Pennsylvania crested at almost 17 ft above flood stage, which was 8 ft above the previous record set in 1902. In western Pennsylvania, the Allegheny, Monongahela, and Ohio Rivers crested at or near record levels. The overall damage from the June 1972 floods in Pennsylvania is estimated at more than $4 billion. Damage to roads, bridges, and other transportation facilities is estimated to exceed $100 million. W74-09393

FLOOD DAMAGE IN SOUTH DAKOTA,
South Dakota State Dept. of Highways, Pierre.
E. L. Rowen, and L. J. Harrison.
Highway Research Record, No 479, p 15-16, 1973. 1 tab.

Descriptors: *Historic floods, *Disasters, *South Dakota, Storm runoff, Cloudbursts, Damages, Bridges, Highways, Flood data.
Identifiers: Black Hills(SD).

South Dakota experienced its most devastating flood in history on June 9 and 10, 1972. This flood covered portions of Lawrence, Meade, Pennington, and Custer counties. The rain began at 5:00 p.m. on June 9 and continued until 2:00 a.m. on June 10 when it slowed to a drizzle that continued all day. Official reports on point rainfall accumulation show up to 14 in. covering about a 40-mile long by 15-mile wide area in the eastern Black Hills area. Two bridges were lost on the Interstate System, and emergency repairs were necessary on four others before traffic could be routed over them. Eighteen other bridges were completely destroyed on the state highway system. A total of 106 bridges were damaged or destroyed within the flood-ravaged area. (Knapp-USGS)
W74-09394

FLOODS IN MINNESOTA,
Minnesota State Highway Dept., Minneapolis.
J. E. Sandahl.
Highway Research Record, No 479, p 17-19, 1973. 2 tab.

Descriptors: *Floods, *Historic floods, *Minnesota, Damages, Highways, Bridges, Storm runoff, Flood data.

During the summer of 1972, Minnesota had rainfalls unprecedented in number, intensity, total rainfall, and area covered. The largest recorded storm in Minnesota history occurred on July 21, 1972, in central Minnesota. The storm was roughly 45 miles wide and 140 miles long, encompassing an area of 6,300 square miles. About 3,500 square miles or 55 persent of the storm area received a rainfall greater than 5 in. in the 8- to 10-hour storm duration; 178 square miles received more than 13 in. of rain. The storm caused the greatest monetary losses ever experienced in the state for a flash flood. Total damages are estimated at $20 million. Of this total, $5.9 million were damages to the road system. (See also W74-09390) (Knapp-USGS)

OBSERVATIONS ON THE CAUSES OF BRIDGE DAMAGE IN PENNSYLVANIA AND NEW YORK DUE TO HURRICANE AGNES,
Federal Highway Administration, Washington, D.C. Office of Engineering and Traffic Operations.
C. L. O'Donnell.
Highway Research Record, No 479, p 20-36, 1973. 24 fig, 3 ref.

Descriptors: *Floods, *Hurricanes, *New York, *Pennsylvania, *Bridges, Highways, Roads, Scour, Flood data, Bridge design, Historic floods.
Identifiers: Susquehanna River, Chemung River.

Hurricane Agnes (1972) caused severe flooding in Pennsylvania and New York. Several bridges and highways that were damaged by the floods in those states are discussed. The two major causes of bridge damage were scour at abutments and poers and impacting debris. Although the June 1972 flood was a maximum of record, many bridges survived the flood with little if any damage. These bridges were of particular interest because they obviously have features that enabled the structures to survive a severe test. The outstanding performance of these structures is a positive indication of features that constitute desirable design standards. A pile foundation of sufficient length or footings founded at a sufficient depth are needed to avoid abutment or pier failure in erodible soils. The amount of scour at bridge abutments and piers failure in erodible soils. The amount of scour at bridge abutments and piers within the bridge opening depended primarily on the amount of construction that the bridge opening imposed on the flood flow. Abutments and piers positioned near the edges of the main channel generally suffered extensive scour damage. The outstanding performance of spur dikes during the June 1972 floods clearly demonstrated that they are one of the most effective means now available for preventing scour damage to bridge approaches, abutments, and adjacent piers in situations involving large quantities of overbank flow. DISCHARGE COEFFICIENTS OF FLOAT-AREA-TYPE FLOW METERS,
Tokyo Science Univ. (Japan).
H. Maki.
Bulletin of the JSME (Japan Society of Mechanical Engineers), Vol 17, No 103, p 83-87, January, 1974. 6 fig, 1 tab, 8 ref.

Descriptors: *Flow measurement, *Instrumentation, *Reynolds number, *Mathematical studies, Flow rates, Application methods.
Identifiers: *Discharge coefficient.

The commonly used discharge coefficients of float-area-type flow meters do not always have constant values over a wide range of characteristic Reynolds numbers. Floats having special shapes or geometrical dimensions have constant value discharge coefficients. A semi-empirical formula to predict flow rate characteristics has been obtained and limits of applicability of this formula are explained. (Sandoski-FIRL)

COMPARISON OF FOUR NUMERICAL METHODS FOR FLOOD ROUTING,
Hydraulics Research Station, Wallingford, (England).
R. K. Price.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY7, Paper 10659, p 879-899, July 1974. 4 fig, 2 tab, 18 ref, 7 append.

Descriptors: *Flood routing, *Numerical analysis, Routing, Flood waves, Waves(Water), Finite element analysis, Unsteady flow, Mathematical models.

The accuracy and efficiency of four of the more important numerical methods for flood routing were compared by simulating the propagation of the monoclinal wave in two channels with different bottom slopes. The implicit method of Amein is in general the most suitable method for routing floods in rivers of small slope. In addition, the implicit method has maximum accuracy when the ratio of the space and time steps is approxi-

mately equal to the flood wave speed. These conlusions are not necessarily valid for flooding in estuaries. The methods examined were Leap-Frog explicit method, two step Lax-Wendroff explicit method, four-point implicit method of Amein, and fixed mesh characteristic method. (Knapp-USGS)

NEW DATA ON WATER CIRCULATION IN THE ARCTIC BASIN (NOVYYE DANNYYE O TSIRKULYATSII VOD ARKTICHESKOGO BASSEYNA),
Arkticheskii i Antarkticheskii Nauchno-Issledovatelskii Institut, Leningrad (USSR).
A. F. Treshnikov, and G. I. Baranov.
Akademiya Nauk SSSR Doklady, Vol 207, No 3, p 702-705, 1972. 1 fig, 11 ref.

Descriptors: *Oceanography, *Ocean circulation, *Ocean currents, *Arctic, *Arctic Ocean, Winds, Eddies, Topography, Depth.
Identifiers: USSR, Hydrosphere, Countercurrents, Isobaths(Oceanography).

Circulation within the hydrosphere is one of the most important mechanisms of redistribution of heat transported to Earth and, in turn, released by Earth into space. Flow of water in the Arctic Basin is one of the links in total water circulation in the hydrosphere. Its importance, however, is not limited to this fact, since variations in circulation of surface waters of the Arctic Basin largely control variations in ice conditions in seas bordering the Arctic and, hence, navigation conditions on Arctic Sea routes. There is a close correlation of hydrologic fields over the entire depth of the ocean. Present investigations of water circulation in the Arctic Basin were based upon a theory of stationary thermohaline circulation as the internal form of movement in the ocean. All components of a geostrophic current were calculated in 1955-56 from known wind and water-density fields, and a diagram of deep circulation in the Arctic Basin was constructed. A developed region of anticyclonic circulation and a large transarctic current were observed in the surface layer. A two-layer circulation was observed in the Eurasian subbasin where bottom waters flow in a direction opposite to that of surface waters and Atlantic waters, and a three-layer circulation develops in the Canada Basin where surface and bottom waters form an anticyclonic circulation, and Atlantic waters form a cyclonic countercurrent. USE OF BASE-RUNOFF RECESSION CURVES TO DETERMINE AREAL TRANSMISSIVITIES IN THE UPPER POTOMAC RIVER BASIN,
Geological Survey, Albuquerque, N. Mex.
F. W. Trainer, and F. A. Watkins, Jr.
Journal of Research, U.S. Geological Survey, Vol 2, No 1, p 123, 125-131, January-February, 1974. 2 fig, 1 tab, 17 ref.

Descriptors: *Potomac River, *Streamflow, *Data collections, *Transmissivity, *Recession curves, *Hydrogeology, Aquifer characteristics, Storage coefficient, Groundwater basins, Runoff.

The recession curve of base runoff is used in geohydrologic study of the upper Potomac River basin. The slope of the recession curve is used with other data to estimate average basin values for transmissivity from streamflow data. Two general recession curves characterize the tributary basins: (1) A continuous (simple) curve approximately straight on a semilogarithmic plot, which represents a constant set of diffusivity values within a basin and (2) a discontinuous (compound) curve, composed of a steeper first segment and a gentler second segment. Simple curves represent basins underlain by sandstone, shale, or crystalline rock; by combinations of these rocks; or by carbonate rock. Compound curves, which represent basins underlain in part by carbonate rock and in part by noncarbonate rock, are believed to reflect seasonal changes in relative discharge of these unlike aquifers, with the carbonate rock providing most of the ground-water runoff during summer-autumn and during drought. Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 100, No IR2, Paper 10582, p 117-125, June 1974. 2 fig, 10 ref, append.

Descriptors: *Recharge, *Water level fluctuations, *Water spreading, Groundwater, Equations, Irrigation, Water table, Surface-groundwater relationships.

Analytical expressions were developed to describe the rise and fall of the water table in an extensive unconfined aquifer receiving localized vertical recharge and discharging into a surface reservoir in which the water level remains equal to that of the main flow before recharge. The rate of recharge is maintained by a spreading area in the form of an infinitely long strip of finite width. The solutions are expressed in terms of the head averaged over the depth of saturation. They are applicable when the rise of the water table is smaller than 50% of the initial depth of saturation. A numerical example is presented. (Knapp-USGS)

PROBLEMS RELATED TO THE EVALUATION OF GROUNDWATER RESOURCES OF THE CRYSTALLINE ROCK AREA, SAN DIEGO COUNTY, CALIFORNIA,
California State Univ., San Diego. Dept. of Geology.
W. J. Ganus.
In: Studies on the Geology and Geologic Hazards of the Greater San Diego Area, California, Ross, A. and Dowlen, R. J., eds., San Diego Association of Geologists, 1973. p 111-118.

Descriptors: *Crystalline rocks, Discharge, Recharge, Pump testing, Runoff, *California.

Methods of evaluating regional groundwater systems in crystalline rocks are discussed. Traditional methods of evaluation, based on rigid analytical models, that assume homogeneous and isotropic materials are ineffective in most crystalline terrains. More realistic evaluations can be obtained using methods based on projections of surface observations, water budget analysis, and pump test. A procedure for conducting pump tests in crystalline reservoirs is outlined and the results of several tests are discussed. Areas of recharge and discharge in a typical crystalline terrain are identified. Finally, the nature and extent of the storage and transmitting material is discussed, and a new model is presented to represent groundwater systems in fractured crystalline rocks. (Martino-NWWA)

J. T. Ligon, and T. V. Wilson.
Transactions of the ASAE (American Society of Agricultural Engineering), Vol 16, No 6, p 1100-1103, November-December, 1973. 15 fig, 6 ref. OWRR A-023-SC(5).

Descriptors: *Soil profiles, *Moisture content, *Watersheds(Basins), Soil moisture, Surface runoff, Precipitation(Atmospheric), Subsurface runoff, Seepage, Root zones, Groundwater, *South Carolina, *Soil moisture.
Identifiers: *Clemson Research Watershed(SC).

The distribution of moisture was investigated in the unsaturated soil profile of a 0.21 acre plot within a 28.4 acre watershed of the 561 acre Clemson Research Watershed in the Piedmont area. Intensive measurements were made of soil moisture to a depth of 32 ft along with measurement of precipitation, surface runoff and interflow to provide some indications of the nature of the deep seepage groundwater recharge phenomenon in this region. It is apparent that downward seepage below the zone of root influence is a continuous process but that the rate of transfer at a point increases rapidly with increased moisture content. At this particular site, where the water table occurs at a depth of 60-65 ft, there is a considerable lag between the occurrence of excess moisture at hthe soil surface and groundwater recharge resulting from this excess. The extent of this time lag is a function of initial soil moisture due to the strong dependence of unsaturated conductivity upon moisture content. (Merritt-FIRL)

Agricultural Research Council, Cambridge (England). Unit of Soil Physics.
A. Poulovassilis.
Journal of Soil Science, Vol 25, No 1, p 27-33, March 1974. 3 fig, 10 ref.

Descriptors: *Soil water movement, *Wetting, *Unsteady flow, Moisture Content, Moisture tension, Hysteresis, Unsaturated flow, Saturated flow.

The relationship between moisture content and suction in porous materials during transient flow conditions was tested. When a vertical column of sand was brought to uniform moisture content and uniform suction in a draining condition by percolating a constant flow through it until apparent equilibrium conditions ensued and then placed horizontally at the same time as the flow was stopped, the suction decreased with time over a period of a day, indicating that the sand was wetting. This decrease was smaller, the drier the sand. However, when the column was left in a vertical position with the water percolating through it for three hours after apparent equilibrium conditions were reached, a small adjustment of moisture content and suction was observed; when it was then placed horizontally as in the previous experiments, little decrease of suction was observed. No change in suction was observed in either case if the equilibrium condition was reached in a wetting porous material. These experimental results are explained by the hypothesis that, during drainage, some water is left in pores from which the air-water interface has already retreated to drain through film flow, more slowly, subsequently to the continuous water body. Additional experiments showed that the release of entrapped air may have a small effect on the uniqueness of the moisture characteristics. (Knapp-USGS)

IMPERMANENT LAKES,
D. Brunsden, and J. C. Doornkamp.
Geographical Magazine, Vol 44, p 393-397, (1973). 6 fig.

Descriptors: *Lake(Inflow), *Discharge(Water), *Bodies of water, *Morphology, Sediments, Glaciers, Lake basins, Lake stages, Artificial lakes, VEOLUME(Sediment-water interfaces, Watersheds, Catchment basin, Evaporation, Water law, Lake shores.
Identifiers: *Tectonic lakes.

The impermanence of lakes is examined. Lakes, regarded as constantly changing natural systems, may be manmade or natural systems; they are generally formed under special but varied conditions such as glacial erosion, downwarping of the earth's crust, and the presence of barriers across river valleys. Rain and groundwater are collected onto the water surface itself or onto the lakes' catchment areas. The catchments supply sediment to the lake which, if it does not possess a vigorous outlet, may be rapidly infilled by course deltaic deposits near the incoming stream mouths, or silts and clays in deeper water or near the lake exit. If very little sediment leaves the storage basin it is possible to estimate the volume of silt on a lake floor and thereby obtain a measure of the rate of erosion of the catchment area. Some lakes may change prmanently when the primary cause for their presence disappears, such as retreating glaciers, out-flowing rivers cutting below the level of the lowest point in the lake basin, or the filling of the lakes with sediments. Lakes can also be drained by man, or tectonic tilting. The importance of lakes in the more recent history of the earth's surface is discussed. (Proctor-Florida)

LAKE ONTARIO HYDRAULIC MODEL STUDY (PRELIMINARY RESULTS),
State Univ. of New York, Buffalo. Dept. of Civil Engineering.
R. R. Rumer, Jr., K. Kiser, and C. Y. Li.
Available from NTIS, Springfield, Va. 22151 as COM-73-10724 Price $3.00 printed copy; 0.95 microfiche. NOAA Sea Grant 2-35281.

Descriptors: *Model studies, *Water circulation, *Lake Ontario, Seiches, Winds, Currents(Water), *Hydraulic models, Hydraulic similitude, Great Lakes.

The response of Lake Ontario to wind stress at the free surface, thermal stratification, and the major inflow and outflow was studied using a physical model. The model is rotated to incorporate the Coriolis force. The experiments include a study of seiche damping in the model of Lake Ontario, a study of the circulation pattern resulting from the inflow of the Niagara River and the outflow of the St. Lawrence River, and a study of the circulation resulting from a superposed, steady westerly wind. The electrolytic technique for generating a neutrally buoyant colored tracer is the primary technique. For seiche decay, boundary friction in the model is reasonably simulated for the main basin but exaggerated in the shallow entrance region to the St. Lawrence River. The observed period and frictional dissipation of the uninodal seiche were strongly influenced by this shallow region north of Main Duck Island. The electrolytic technique for observing water movement is highly satisfactory. (Knapp-USGS)

CONTENT AND COMPOSITION OF PLANT PIGMENTS IN THE RYBINSK RESERVOIR (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Institut Biologii Vnutrennykh Vod.
V. A. Elizarova.
Gidrobiol Zh, Vol 9, No 2, p 23-33, 1973, Illus, English summary.
Identifiers: Carotenoids, *Chlorophyll, *Phytoplankton, *Pigments(Plants), Reservoirs, *USSR(Rybinsk reservoir).

Three peaks in the plant pigments concentration in the waters of Rybinskoya (USSR) reservoir are noted (June, Aug., Sept.), that coincide with the periods of the most intense phytoplankton development. Vertical distribution of pigments in the spring and autumn is rather even; a summer peak in chlorophyll a concentration within upper 2 m water layer, and chlorophyll c in the bottom layer is noted. Average chlorophyll content for the study period was in limits 3.5 to 9 for chlorophyll a, 0.4 to 1.0 for chlorophyll b, 1.4 to 2 mcg/l for chlorophyll c, and 3.7 to 7.0 mSPU/l for carotenoids. The correlation carotenoids/chlorophyll a was calculated. This value changes during the vegetation period, and depends on the phytoplankton composition and its physiological state.--Copyright 1974, Biological Abstracts, Inc.
W74-09446

PHILOMETRA LUSIANA FROM FISHES OF THE KREMENCHUG RESERVOIR, USSR, (IN RUSSIAN),
Ukrainian Research Inst. of the Fish Industry, Kiev (USSR).
V. P. Bachinski, and N. F. Gomonenko.
Parazitologiya, Vol 7, No 3, p 293-294, 1973, English summary.
Identifiers: *Philometra-lusiana, Reservoirs, *USSR(Kremenchug reservoir), *Fish parasites.

P. lusiana which was previously known only from pond fisheries, was recorded from fishes of natural waters. An increase in the infection rate of fishes with P. lusiana in the Kremenchug reservoir shows that conditions prevailing in natural waters are favorable for the completion of the life cycle of this parasite.--Copyright 1974, Biological Abstracts, Inc.

SUBSURFACE FLOW INTO LAKE BAYKAL BASIN (PODZEMNYY STOK BASSEYNA OZ. BAYKAL),
Institut Zemnoi Kory, Irkutsk (USSR).
B. I. Pisarskiy.
In: Ocherki po gidrogeologii Sibiri; Komissiya po Izucheniyu Podzemnykh Vod Sibiri i Dal'nego Vostoka Materialy, No 6, p 43-52, Novosibirsk, 1973. 7 tab.

Descriptors: *Lakes, *Lake basins, *Subsurface flow, *Groundwater movement, *Surface-groundwater relationships, Streamflow, Discharge(Water), Springs, Water types, Rivers, Underflow, Groundwater resources, Fractures(Geologic), Rocks.
Identifiers: *USSR(Lake Baykal), Tectonics.

Subsurface flow into Lake Baykal consists of (1) groundwater contribution to streamflow; (2) underchannel flow; and (3) deep inflow of cold and thermal waters along fracture zones. Groundwater contribution to streamflow is the major part of the natural groundwater resources and is 18,210 million cu m/yr or 1.1 liters/sec/sq km. The role of underchannel flow and of flow through fracture zones is negligible. The rate of underflow is estimated at 1,030 million cu m/yr. Deep flow through fracture zones in the area of the lake cannot be directly measured. Excess of outflow from the basin over inflow is 2,680 million cu m/yr. On the basis of calculations, total natural groundwater resources in Lake Baykal basin are estimated at 20,890 million cu m/yr, and the average rate of subsurface flow is 1.26 liters/sec/sq/km. (See also W74-09641) (Josefson-USGS)

Identifiers: *USSR(Tuva ASSR), Mineral springs, Balneology, Mineralization.

The Tuva Autonomous Republic has many mineral lakes of varying composition and mineralization. Water-surface areas of the lakes are generally small (0.5-5.0 sq km) except for Lake Khadyn (23.6 sq km) and Lake Ubsu-Nur (3,350 sq km), which borders on the Mongolian People's Republic. Depth of the lakes varies between 0.3 and 3.4 m, occasionally reaching 10 m or more (Lake Khadyn). The thickness of mud deposits is 0.3-1.0 m and, in places, 1.5 m. The dissolved-salts content in the lakes varies between 2 and 340 g/liters and the water temperature, between 15 and 28 deg C. Distribution of 11 mineral lakes in central Tuva is mapped, and chemical composition of 6 mineral lakes and trace-element composition of 10 mineral lakes are tabulated. Use of natural brine of the lakes is recommended for balneological and industrial purposes. (See also W74-09641) (Josefson-USGS)

SURFACE SEDIMENTS IN HAMANA LAKE, THE PACIFIC COAST OF CENTRAL JAPAN,
Shizuoka Univ. (Japan). Faculty of Science.
I. Noriyuki, and T. Handa.
Rep Fac Sci Shizuoka Univ. 7 p 129-148, 1972, Illus.
Identifiers: Coast, Composition, *Japan(Hamana Lake), Lakes, Pacific Ocean, Sediments, *Zostera-Marina, *Lake sediments.

A grain-size analysis was made on the surface sediments of Hamana Lake, Japan with sieving and pipette methods. The sediments were divided into 3 major types. Distributions of Phi-Median, Sigma-Phi and Alpha-Phi are calculated from the cumulative curves and discussed in relation to the hydraulic condition of the lake. Sand which is distributed in the southern part of the lake is probably supplied by the tide currents from the open sea. Silt which occupies northern half of the lake originates from the suspension mainly supplied by terrestrial water. Sediments sustaining Zostera marina are characterized by the well sorted sand with approximately 30% mud content in 3-4 m water. Z. nana is found in low salinity areas with sediments of gravel-bearing sand and silt.--Copyright 1973, Biological Abstracts, Inc.

AN INFORMATION SYSTEM FOR THE MANAGEMENT OF LAKE ONTARIO,
Cornell Univ., Ithaca, N.Y.
H. D. Reynolds.
Available from NTIS, Springfield, Va, 22151 as COM-73-11249, Price $5.50 printed copy, $1.45 microfiche. New York State Sea Grant Program, Great Lakes Management Problems Series, May 1973, 190 p, 7 fig, 9 tab, 77 ref.

Descriptors: *Information exchange, *Lake Ontario, *Information retrieval, Data storage and retrieval, Water management(Applied), International Joint Commission, Planning, Data collections, Great Lakes, Canada, United States.

An information system is proposed for the management of Lake Ontario. It should be effectively and efficiently responsive to the needs of the users, considering the purposes to be served and the types and amounts of information required to serve these purposes. The study provides a logical procedure for identifying information users, needs, sources, and implications for the nature of the information system and provides a basis for case studies. The case studies illustrate this procedure in a detailed manner. The information system being considered will not only serve the Experimental Operations Office in carrying out its management and planning tasks, it will also serve as a means to carry out the much needed task of providing coordination of information collection, storage, and dissemination among all parties in Canada and the United States concerned with water resources. EFFICIENCY OF FUNCTIONING OF THE MAIN ECOSYSTEMS OF THE EUROPEAN FOREST-STEPPE, (IN RUSSIAN),
A. M. Grin, Yu. L. Rauner, and V. D. Utekhin.
Dokl Inst Geogr Sib Dal'Nego Vostoka. 33. p 45-50. 1972.
Identifiers: *Ecosystems, *Europe(Forest-steppe), Moisture, *Productivity, Solar radiation, *Biota, USSR(Kursch).

The biological productivity of ecosystems depends on the efficiency of utilizing the material and energy resources of the environment (solar radiation, moisture, etc.) by the biota. The efficiency is determined by the internal structure of the biota. It is suggested to distinguish 2 aspects of the structure: edification and adaptive. The edification structure determines the uptake of the environmental resources by the ecosystem and the adaptive structure determines the completeness of their utilization by the biota. Indexes are presented of the utilization of radiation and moisture in the main ecosystems of the forest-steppe in the region of Kursch (USSR) forest, steppe and agricultural (field). The edification and adaptive structures of the plant part of the biota (phytobiota) in these associations are described and the significance of the characteristics of the structure for efficient operation of the ecosystem is considered.--Copyright (c) 1974, Biological Abstracts, Inc.

Extensive collections of mussels were made in the Elk River basin during 1965-1967. Thirty species of mussels not previously reported for this drainage were collected in addition to 18 spp. reported by Ortmann (1925). Twenty-six Cumberlandian and 35 spp. of Ohioan or unknown origin comprise the total mussel fauna reported for Elk River. Species of Cumberlandian origin reported by Ortmann have declined and species usually associated with larger rivers have increased. Tims Ford Dam (closed Dec. 1970) will, undoubtedly, significantly affect the mussel fauna of Elk River. Endangered mussel species in the portion of the Elk River covered by this study include Fusconaia cuneolus, F. edgariana, Quadrula intermedia, Lexingtonia dolabelloides, Lastena lata and Dysnomia biemarginata.--Copyright 1973, Biological Abstracts, Inc.

Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY7, Paper 10672, p 935-949, July 1974. 11 fig, 3 tab, 18 ref, 2 append.

Descriptors: *Bed load, *Porous media, *Sediment transport, Shear stress, Particle size, Pore water, Alluvial channels, Hydraulic models, Groundwater movement.

An upward flow of water through a porous sand bed reduces the apparent weight of the sand particles and therefore their stability. This effect increases the rate of transport. From literature it is known however, that upward flow also reduces the flow velocity near the bed and the bed shear stress, which decreases the rate of transport. The predominating effect depends on the flow conditions in and above the bed. Downward flow gives opposite effects. Both aspects were examined and the theoretical relations were compared with the results of experiments that were carried out in the Delft Hydraulics Laboratory. For the range of grain sizes studied, downward flow always decreased the rate of sand transport whereas upward flow increased this rate. The grain size of the transported particles was greater than that of the bed particles. This effect was enhanced with downward flow and was less pronounced for upward flow. (Knapp-USGS)

ESTIMATION OF WASHLOAD PRODUCED ON CERTAIN SMALL WATERSHEDS,
New York State Univ., Buffalo. Dept. of Civil Engineering.
O. Rendon-Herrero.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY7, Paper 10638, p 835-848, July 1974. 10 fig, 1 tab, 9 ref, 2 append.

Descriptors: *Sediment yield, *Suspended load, *Unit hydrographs, *Hydrograph analysis, Land use, Storm runoff, Overland flow, Sediment discharge, Small watersheds, *Pennsylvania.
Identifiers: *Bixler Run(Pa).

To predict suspended load production on small watersheds, a method is presented that is analogous to the unit-hydrograph method. The ordinates of a sediment discharge graph are divided by the excess runoff that mobilized it, producing a unit sediment discharge graph. For many storm events, unit sediment discharge graphs are generated that vary considerably in peak value and shape. The ordinates of the graphs are then plotted logarithmically against their respective excess runoff, yielding data points that can be fitted by straight lines. Estimation of the sediment discharge or of a sediment discharge graph for a given excess runoff can therefore be accomplished. Bixler Run Watershed, Pa., 15 sq miles in area, was used as a data source. Granulometric tests disclosed that the suspended sediment in Bixler Run is predominately washload. (Knapp-USGS)

STOCHASTIC ANALYSIS OF DUNE BED PROFILES,
Harza Engineering Co., Chicago, Ill. Water Resources Planning Div.
B. K. Lee, and H. E. Jobson.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY7, Paper 10657, p 849-867, July 1974. 8 fig, 5 tab, 15 ref, 2 append.

Descriptors: *Bed load, *Channel morphology, *Dunes, Profiles, Flumes, Hydraulic models, Stochastic processes, Sand waves, Sediment transport, Statistics, Dispersion, Probability.

Application of stochastic models of bed-load transport and dispersion requires a knowledge of the probability distributions of the step lengths and the rest periods of the particles. The probability distributions of the rest periods, the elevation of particle deposition, and the elevation of particle erosion were obtained in a large flume from a continuous record of bed elevation at a fixed point as a continuous function of time. The probability distribution of the step lengths was obtained from a series of instantaneous longitudinal bed profiles and the distribution of the elevation of particle deposition and erosion. Using an existing transport equation, the total sediment transport in the flume was predicted for three flow conditions. The errors in the predicted total sediment transport rates were -3.0%, +3.5%, and +80.1%. (Knapp-USGS)

PRESENT STATE AND PROSPECTS OF USE OF THERAPEUTIC MINERAL WATERS IN THE IRKUTSK OBLAST (SOSTOYANIYE I PERSPEKTIVY ISPOL'ZOVANIYA LECHEBNYKH MINERAL'NYKH VOD IRKUTSKOY OBLASTI),
Institut Zemnoi Kory, Irkutsk (USSR).
V. F. Kaurov, Ye. V. Pinneker, and P. I. Trofimuk.
In: Ocherki po gidrogeologii Sibiri; Komissiya po Izucheniyu Podzemnykh Vod Sibiri i Dal'nego Vostoka Materialy, No 6, p 58-64, Novosibirsk, 1973.

Descriptors: *Water chemistry, *Water quality, *Mineral water, Salts, Chlorides, Sulfates, Water types, Saline water, Brines, Springs, Water wells, Water utilization, Human population.
Identifiers: *USSR(Irkutsk Oblast), Mineral springs, Spas, Balneology, Hydropathy, Mineralization.

The Irkutsk Oblast has an abundance of therapeutic waters which vary in degree of mineralization, composition, and temperature. The vast Angara-Lena Basin on the Siberian Platform contains therapeutic brines and saline waters. Thermal, carbonic acid, and radon waters are found in mountains of eastern Sayan and the Baykal uplands. Brines of deep horizons are of calcium- or sodium-chloride types and contain such balneologically active components as hydrogen sulfide, bromine, and radon. Sodium-chloride, calcium-chloride, calcium-sulfate, and sodium-sulfate waters occur at relatively shallow depths (100-700 m). About 250 springs and wells containing therapeutic mineral waters have been discovered in the Oblast. Only three spas in the Oblast are presently using mineral waters. Local sanatoriums can today accommodate 1,250 persons out of a population of about 2.5 million. When completed, the 'Novoye Usol'ye spa will increase total accomodations to 1,800, a figure considerably lower than 1970 requirements (4,000-4,500). Based on a projected population of 2.8 million by 1975, sanatoriums will soon have to provide facilities for 5,000 persons. Problems in the use of mineral waters in the Oblast in 1971-80 include: (1) expansion and reconstruction of existing spas; (2) elimination of strong hydrogen-sulfide brines near Novonukutsk village for construction of a large spa; (3) organization of new regional sanatoriums; (4) construction of hydropathic establishments for treatment of diseases in almost all administrative centers in the Oblast; and (5 construction of mineral-water bottling plants. Consideration must be given to construction of a locality around Lake Baykal for exploitation of the region's hydromineral resources. (See also W74-09641) (Josefson-USGS)

MINERAL WATERS OF NILOVAYA PUSTYN', THEIR REGIME AND RESOURCES (MINERAL'NYYE VODY NILOVOY PUSTYNI, IKH REZHIM I RESURSY),
Institut Zemnoi Kory, Irkutsk (USSR).
I. M. Borisenko.
In: Ocherki po gidrogeologii Sibiri; Komissiya po Izucheniyu Podzemnykh Vod Sibiri i Dal'nego Vostoka Materialy, No 6, p 107-112, Novosibirsk, 1973. 3 tab.

Descriptors: *Water chemistry, *Water quality, *Mineral water, Salts, Springs, Thermal water, Gases, Hydrogeology, Structural geology.
Identifiers: USSR(Buryat ASSR), Balneology, Mineralization, *USSR(Nilovaya Pustyn').

Mineral waters of Nilovaya Pustyn' discharge in the valley of the Ikhe-Ukhgun' River (tributary of the Irkut), 7 km north of Turan village, Tunkinskiy Rayon, Buryat ASSR. The chemical composition of the waters is of the sodium-sulfate type with a mineralization of 1 g/liter. On the basis of data of detailed explorations in 1967, the rate of discharge of mineral waters was found to be 1,816 cu m/day. The mineral waters are characterized as thermal with a constant temperature (40-42 deg C). Mineral waters of Nilovaya Pustyn' are widely used in the Irkutsk Oblast, Buryat Assr and other regions. The waters have a very therapeutic effect in the treatment of many diseases. The high therapeutic properties of the mineral waters should provide an impetus for establishment of a large spa at Nilovaya Pustyn'. (See also W74-09641) (Josefson-USGS)

Akademiya Nauk SSSR, Moscow. Institut Okeanologii.
Ye. G. Agafonava, and A. S. Monin.
Akademiya Nauk SSSR Doklady, Vol 207, No 3, p 586-588, 1972. 1 fig, 1 ref.

Descriptors: *Atlantic Ocean, *Surface waters, *Salinity, *Temperature, *Statistical methods, Correlation analysis, Regression analysis.
Identifiers: USSR, Probability density, Probability distribution.

Natural relations between heating, cooling, evaporation, precipitation, and horizontal and vertical movements of water create a specific statistical relation between temperature and salinity of ocean water. This statistical relation is a distict characteristic of both ocean and world climates. The most complete description of this statistical relation is the two-dimensional probability density p(S,T), where S is salinity and T is temperature of ocean water. This function can be used to describe the thermodynamic state of the world ocean and to compare climates of individual seas. The function was derived for surface waters of the Atlantic on the basis of data gathered by the Instiute of Oceanology of the USSR Academy of Sciences. These data encompass 80% of all data accumulated throughout the world during the last 100 years. For the Atlantic, these data cover about 70,000 stations, 90% of which relate to the period 1925-65. Most observations were conducted north of 40 deg North Latitude and mainly in summer. (Josefson-USGS)

TIDAL CURRENTS, SEDIMENT TRANSPORT, AND SAND BANKS IN CHESAPEAKE BAY ENTRANCE, VIRGINIA,
Old Dominion Univ., Norfolk, Va. Inst. of Oceanography.
J. C. Ludwick.
Technical Report No 16, November 15, 1973. 13 p, 4 fig, 1 tab, 14 ref. ONR-GP Contract N00014-70-C-0083.

Descriptors: *Sediment transport, *Estuaries, *Chesapeake Bay, Currents(Water), Tides, Sedimentary structures, Sands, *Virginia.

The mean of tidal current measurements at ebb and flood strength in the entrance of Chesapeake Bay are nearly equal at 42 cm/sec. At individual stations, ebb maximum is 79 cm/sec; flood maximum is 66 cm/sec; however, at more than half the observation stations, maximum flood speed and duration exceed maximum ebb speed and duration. At 19 of 24 stations, ebb-directed sediment transport exceeds flood-directed sediment transport. Much of the longer flood is incompetent and the greater ebb shear stress more than offsets larger flood speeds. Net sediment transport is directed landwards only in parts of channels and in dead-end sinuses which are re-entrant into shoals and open to flood currents. In the Chesapeake Bay entrance net sediment transport at the headlands is directed seaward. Individual shoals within the entrance are bounded on one side by a net sediment transport to seaward and on the other side by a net sediment transport to landward. Ebb deltas and flood deltas occur in alternate succession across the entrance. There is also an interior flood delta found where ebb-directed sediment is interdicted and swept landwards in a flood-dominated channel. (Knapp-USGS)
W74-09368

THE COOPER RIVER ENVIRONMENTAL STUDY.
South Carolina Water Resources Commission State Water Plan Report No 117, April 1974. 164 p.

Descriptors: *Estuaries, *South Carolina, *Saline water intrusion, *Flow control, Path of pollutants, Stratified flow, Streamflow, Discharge(Water).
Identifiers: *Cooper River(SC), *Charleston Harbor(SC).

Construction of the Santee-Cooper complex in 1942 diverted substantial quantities of water from the Santee River into the Cooper River system. Not only did this modify the volumes of flow in both rivers, but it also produced an alteration of the Charleston Harbor environment characterized by stratifications of water which had previously been a more or less homogenous fresh and saline mixture. At the interface between tidal saline inflows and the less dense overriding freshwater, suspended material in downstream transport settles out and creates problems to navigation by its deposition in ship channels. The solution under consideration is to redivert a substantial part of the Cooper River back to its former natural course. The net effect will be a reduction of siltation in the harbor and an accompanying alleviation of the need for extensive harbor dredging. In order to study some of the questions that may accompany reduced flows in the Cooper River, a controlled low-flow period was scheduled. A mixed estuary will provide for more rapid seaward transport of bottom materials, returning this feature to prediversion conditions. The removal of such deposits will reduce oxygen uptake potentials in lower Cooper River and elsewhere in the Harbor thus alleviating previous concern of septicity that could occur during periods of low flow and elevated temperature. (See W74-09380 thru W74-09389) (Knapp-USGS)

In: Cooper River Environmental Study: South Carolina Water Resources State Water Plan Report No 117, p 13-20, April 1974. 2 fig, 4 tab.

Descriptors: *Estuaries, *Standing crops, *Productivity, *Aquatic life, *South Carolina, Aquatic animals, Fish, Aquatic productivity, Surveys, Aquatic populations, Fish populations, Biomass.
Identifiers: *Cooper River(SC).

Estimates of the standing crop and species composition of free-swimming aquatic macroorganisms were obtained in three tidal streams of the lower Cooper River system, South Carolina, once each during the spring, summer, and fall of 1971 to provide baseline data prior to further habitat modification. Forty-five species of fishes and three species of crustaceans were collected in the combined samples from the three streams. Although a greater number of species was collected during the fall (35) than during summer (33) and spring (26), greater numbers of individuals were taken during the summer (503,000/acre) and spring (189,000/acre); a mean of 122,000/acre was collected during the fall. Ten species of fishes made up 95% of the total fish catch, and three of these species accounted for 75% of that total; they were Atlantic croaker, Atlantic menhaden, and mummichog, in order of abundance. The grass shrimp was by far the most abundant of all organisms present and constituted 96% of the total number of invertebrates. Mean biomass for the three surveys was 249 pounds/acre. Invertebrates were 63% of that weight with grass shrimp accounting for 131 pounds/acre and blue crab, 19 pounds/acre. American eel dominated the fish biomass and was represented by 16 pounds/acre. The studies strongly emphasized the importance of the tidal streams as nursery areas as 65% of all organisms collected and many of the predominant forms were represented almost entirely by larval, post-larval, and juvenile stages. VERTICAL DISTRIBUTION OF EPIPHYTIC ALGAE ON SPARTINA ALTERNIFLORA FROM TRANSECTS ALONG THE COOPER AND WANDO RIVERS,
South Carolina Univ., Columbia.
W. T. Batson, and B. C. Blackwelder.
In: Cooper River Environmental Study: South Carolina Water Resources State Water Plan Report No 117, p 22-35, April 1974.

Descriptors: *Algae, *Estuaries, *South Carolina, Data collections, Aquatic bacteria, Aquatic microorganisms.
Identifiers: *Cooper River(SC), *Spartina alterniflora.

Stalks of Spartina alterniflora from the Cooper and Wando Rivers, S.C., were collected and examined to detect the presence of epiphytic algae. Fifteen species of algae were found in the transects examined. Nine species were of the phylum Cyanophyta, three species were of the phylum Rhodophyta, and three species were of the phylum Chlorophyta. The most abundantly occurring species were Chaetomorpha minima and Entophysalis conferta. Other than algae, the most abundantly occurring epiphytes were bacteria. (See also W74-09379) (Knapp-USGS)

VASCULAR PLANT SURVEY OF MARSH AND ADJACENT HIGHLAND IN SELECTED PORTIONS OF COOPER RIVER AND WANDO RIVER,
South Carolina Univ., Columbia.
W. T. Batson.
In: Cooper River Environmental Study: South Carolina Water Resources State Water Plan Report No 117, p 36-40, April 1974. 1 tab.

Descriptors: *Sampling, *Marsh plants, *Marshes, *Vegetation, Estuaries, Grasses, Data collections, Aquatic weeds.
Identifiers: *Cooper River(SC).

During the last half of June and the first half of July 1971, a floristic survey was conducted in the Charleston Harbor area. The study area consisted of marshlands only, and was dominated by Spartina and Juncus communities. The creek margins as well as those of the river gave evidence of a gradual long term, but significant rise in water level. This evidence was of three types. First, Juncus communities sometimes extended down to low tide level, although normally this type community develops only on higher ground and is separated from low tide level by a band of Spartina. Second, in the Juncus communities that extended to low tide level, it was frequently noted that 10 to 20 foot wide sections of the densely rooted sod had cracked deeply (1-3 feet) and tilted toward the water, and in that position was rapidly being destroyed by tidal erosion. Third, in areas where hammocks or low mounds with trees occurred, the outer trees were frequently dead and marsh vegetation invading. (See also W74-09379) (Knapp-USGS)
W74-09382

THE VEGETATION OF THE COOPER RIVER ESTUARY,
South Carolina Univ., Columbia.
R. Stalter.
In: Cooper River Environmental Study: South Carolina Water Resources State Water Plan Report No 117, p 41-45, April 1974. 2 fig, 1 tab.

Descriptors: *Sampling, *Marsh plants, *Marshes, *Vegetation, Estuaries, Grasses, Data collections, Aquatic weeds.
Identifiers: *Cooper River(SC).

The vegetation of the Cooper River Estuary, South Carolina is adapted to salinity and duration and depth of flooding. The vegetation zones, listed in order of decreasing elevation above sea level are: the upper high marsh, the zone of low soil salt content (0.5% or less) and infrequent flooding, occupied by the high tide bush, sea-myrtle, high water grass, and occasionally by switch-grass; the lower high marsh, the zone of moderate soil salt content (0.3 to 3.0%) and infrequent flooding, occupied by needle rush, salt grass, glasswort, saltwater cordgrass, sea lavender, and the sea oxeye; upper low marsh, the zone of moderate to high salt content (0.5 to 3.2% and up to 5.0% in salt pans) and slightly longer periods of flooding than the Lower High Marsh, dominated by a pure stand of dwarf saltwater cordgrass; and the lower low marsh, the zone of moderate soil salt content (0.5 to 3.0%), flooded twice a day by the tides, with submergence as long as 15 hours a day, dominated by a pure stand of tall saltwater cordgrass. SURFACE WATER HYDRAULICS.
In: Cooper River Environmental Study: South Carolina Water Resources State Water Plan Report No 117, p 119-123, April 1974. 2 fig, 2 tab.

Descriptors: *Estuaries, *South Carolina, *Saline water intrusion, *Flow control, Path of pollutants, Stratified flow, Streamflow, Discharge(Water).
Identifiers: *Cooper River(SC), *Charleston Harbor(SC).

Most of the Santee River (South Carolina) streamflow is diverted through Lake Moultrie into the Cooper River. The U.S. Corps of Engineers proposes to redivert the streamflow via a canal from Lake Moultrie to the lower Santee River channel. A sustained flow from Lake Moutrie of 3,000 cfs will probably be sufficient to keep saltwater below the Cooper River entrance to the Durham Creek Canal under normal tidal conditions. Just prior to the 3,000 cfs sustained-flow period, the salt-water wedge at high slack tide came to about mile 13.5, using a conductivity base of 125 micromhos as the delineation between salt and fresh water. The leading edge of the wedge evidences a greater degree of stratification at high and medium fresh-water inflows than at low fresh-water inflows. After three of four days of sustained low-flow the linear extent of high tide penetration became relatively stable. The leading edge of the wedge became a diminution of well-mixed salinity in cross-sections rather than a pronounced wedge effect. The measured values of the investigated parameters remained fairly constant in absolute values at the same depth throughout the cross section. Neither DO nor pH showed much variation from saline to fresh water. At 9,300 micromhos, 16.5 deg C, DO was 7.3 ppm, pH was 7.6; at 160 micromhos, 15.5 deg C, DO was 8.2 ppm, pH was 7.2. WATER SUPPLY EVALUATION AND PROPOSED COMPREHENSIVE STUDY OF THE CHARLESTON-BUSHY PARK INDUSTRIAL COMPLEX, SOUTH CAROLINA,
Geological Survey, Columbia, S.C.
R. A. Gardner, and P. W. Johnson.
In: Cooper River Environmental Study: South Carolina Water Resources State Water Plan Report No 117, p 130-148, April 1974. 2 fig, 7 tab, 36 ref.

Descriptors: *Water resources development, *Hydrologic data, *South Carolina, Groundwater, Surface waters, Water supply, Data collections, Planning, Water supply, Evaluation.
Identifiers: *Cooper River(SC), *Charleston(SC).

In the area drained by the Ashley and Cooper Rivers, Charleston, South Carolina at least 10 times the amount of water currently being utilized could be developed. Enough data to plan the development of the water resources are not available. An estimated 25 mgd could be developed from surface water sources in the area (excluding diversions into the Cooper River) and an estimated 50 mgd or more could be developed from groundwater sources in the area. A plan is proposed for a full-scale investigation to develop a data system for accurately evaluating the water resources of the area and to establish the effect such development will have. THE EFFECTS OF WATER RESOURCES DEVELOPMENT ON ESTUARINE ENVIRONMENTS,
Texas Water Development Board, Austin. Coastal Zone Studies Branch and Systems Engineering Div.
J. C. Nelson, D. G. Rauschuber, and L. F. Tischler.
Water Resources Bulletin, Vol 9, No 6, p 1249-1257, 1973. 2 fig, 5 ref.

Descriptors: *Operations research, *Planning, *Water resources development, *Estuarine environment, Bays, *Texas, Limnology, Oceanography, Baseline studies, Hydrologic data, Coasts, Estuaries.

To meet statutory and growing data requirements for understanding the impact of economic growth and increased water demands on the ecosystem of Texas bays and estuaries, the Texas Water Development Board has begun extensive estuarine data collection and research designed to3 91) define relationship between the estuarine ecosystem and fresh water and nutrient inflows and (2) develop quantitative simulation techniques projecting this relationship. With the assistance of the U.S. Geological Survey's reconnaissance studies and the Texas Park and Wildlife's selected coastal zone monitoring, physical and chemical water quality and biological data on the estuarine ecosystem has been collected and analyzed. The Board also initiated the development of mathematical models of bays and estuaries. One, a tidal hydrodynamic model is designed to determine the effects of alternative estuarine development and management plans, providing data on intra-tidal behavior, sediment, water surface elevation and velocity patterns. The estuarine mass transportation model provides data on the distribution of tidal-averaged concentrations of constituents of interest at each nodal point. (Schroeder-Wisconsin)

HYDROGRAPHIC FRAMEWORK OF THE DOBOY SOUND ESTUARY AND SURVEYS OF THE OTHER TIDAL INLETS ALONG THE COAST OF GEORGIA,
Skidaway Inst. of Oceanography, Savannah, Ga.
F. Oertel.
Georgia University Marine Science Center, Skidaway Island, Technical Report Series No 74-1, 1974. 61 p, 17 fig, 11 tab, 51 ref.

Descriptors: *Sediment transport, *Estuaries, *Georgia, Tides, Bores, Sedimentation, Littoral drift, Inlets(Waterways), Shoals, Currents(Water), Water circulation.
Identifiers: *Doboy Sound(GA).

The sediment budget was studied at the entrance of the Doboy Sound estuary, Georgia. Patterns of diversion develop in response to seasonal fluctuations in wind and wave approach interacting with inlet tidal drains. Mutually evasive flow paths of ebb and flood currents influence the formation of shoals adjacent to inlets. Shoals at the entrance to Doboy Sound are partially exposed at low water and exhibit two trends. Three shoals form an elongate-offshore orientation that extends several miles seaward of the entrance. A fourth elongate shoal is oriented parallel to the beach approximately one-quarter mile offshore. During the summer months, sediment is transported in a closed system within these shoals, and there is essentially no sediment by-passing at the inlet although some by-passing apparently takes place seaward of the entrance. This condition results in lateral and vertical expansion of shoals and in sediment 'starved' areas adjacent to shoals. Estuaries with large fluvial sources of water are distinctly different in form and hydrographic character from tidal inlets without fluvial sources of low salinity water. Sedimentation occurring in estuaries with large fluvial sources is generally a response to some form of bi-polar flow associated with a stratified water mass. The tidal inlets generally have large tidal drains that are diverted by mutually evasive tidal channels and inlet surges. (Knapp-USGS)

Available from NTIS, Springfield, Va. 22151 as AD-773 595, Price $3.75 printed copy; $1.45 microfiche. Final Report to U.S. Army Research Office, July 1973. 47 p, 14 fig, 2 tab, 48 ref, 2 append. DA-ARO-D-31-124-G1164 and DA-ARO-D-31-124-70-G47.

Descriptors: *Estuaries, *Turbidity, *Sediment transport, *Virginia, Floods, Sediment distribution, Density currents, Saline water intrusion, Stratified flow.
Identifiers: *Rappahannock Estuary(Va).

Turbidity in the Rappahannock Estuary, Virginia was studied to determine how high concentrations of suspended sediment accumulate to form a maximum. Time-series observations of current velocity, salinity and suspended sediment over 8 to 18 tidal cycles reveal that the maximum forms in a convergence of bottom residual currents near the transition between fresh and salty water. Sediment supplied mainly by the fiver is transported into the convergence by density currents and accumulates where velocity is nearly zero and settling rate exceeds upward current velocity. The maximum forms in the middle estuary after freshet and shifts upstream with landward shift of salt intrusion and diminished river inflow. At the same time, its intensity is reduced by settling out, reduced strength of the convergence, and increased mixing. Prime prerequisites for development are a strong convergence and high river inflow. (Knapp-USGS)

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

FINAL ENVIRONMENTAL STATEMENT, (OFFICE OF SALINE WATER)--FIVE YEAR EXTENSION RESEARCH AND DEVELOPMENT, PUBLIC LAW 92-60.
Office of Saline Water, Washington, D.C.
Available from the National Technical Information Service, Springfield, Va. 22151, as EIS-73-0266-F, $7.00 paper copy. February 1973. 100 p, 10 ref, append.

Descriptors: *Saline water, *Desalination, *Research and development, *Water supply, *Water management(Applied), Legislation, Water utilization, Water reuse, Sewage, Sewage treatment, Effluents, Water quality, Water resources, Water resources development, Corrosion, Brines, Environmental effects, Surface waters, Groundwater, Weather modification, Cooling water, Industrial water, Municipal water, Agriculture.
Identifiers: *Environmental Impact Statements, San Diego(Calif.), Roswell(N.M), Freepor

Webster(S.D), Wrightsville Beach(N.C.), Fountain Valley(Calif.).

Effects of a five-year extension of the Saline Water Conversion Program for fiscal years 1973 through 1977 are evaluated. The program is designed to develop and demonstrate practical means to convert saline water and other chemically contaminated water to a quality suitable for municipal, industrial, agricultural and other beneficial uses. Current operational aspects of the test facilities such as the concentration of influent water and discharge of brine, the use of water for direct cooling, the introduction of trace quantities of corrosion products and the consumption of energy were determined to have quantitatively negligible impact on the environment. Alternatives to the proposed action which were considered included surface water development, groundwater development, improved water management practices and recycling of sewage and effluents for use in industry and agriculture. Also considered were various forms of weather modification to increase precipitation, as well as taking no action. (Ritchie-Florida)

3B. Water Yield Improvement

RESULTS GENERATED FROM A ONE-DIMENSIONAL WARM FOG MODEL WHICH SIMULATES HYGROSCOPIC SEEDING,
Navy Weather Research Facility, Norfolk, Va.
P. M. Tag.
Available from NTIS, Springfield, Va 22151 AD-769 226 Price $5.50 printed copy; $1.45 microfiche. Technical Paper No 11-71, May 1971. 63 p, 25 fig, 1 tab, 14 ref.

Descriptors: *Cloud seeding, *Fog, *Weather modification, Artificial precipitation, Chemistry of precipitation.
Identifiers: *Hygroscopic seeding.

The processes involved in clearing fog were studied to provide guidelines for field experimentation. Using a single-dimensional, 10-level, microphysical fog model, computer runs were made to determine the effect of hygroscopic seeding, method of seeding, and fog conditions under which hygroscopic seeding would be effective. Diagrams were drawn to show the degree of dependence of successful clearing upon treatment concentration and droplet spectrum. These diagrams were drawn for two fog types--one, a dense advective fog of depth of 300 m.; the other, a less dense radiation fog of a depth of 150 m. The difficulty of hygroscopic seeding increases with fog depth and water content. (Knapp-USGS)

PROJECT CUM II--STUDIES OF THE RAIN PARAMETERS OF RANDOMLY SEEDED WARM AND COLD CUMULI,
Weather Science, Inc., Norman, Okla.
J. L. Sutherland, and D. R. Booker.
Available from NTIS, Springfield, Va. 22151 as AD-768 970, Price $3.00 printed copy; $1.45 microfiche. Air Force Cambridge Research Laboratories Technical Report AFCRL-TR-73-0515, July 1973. 32 p, 13 fig, 3 tab. AFCRL Contract F19628-70-C-0228.

Descriptors: *Cloud seeding, *Cloud physics, Florida, Oklahoma, Weather modification, Precipitation(Atmospheric), Artificial precipitation.
Identifiers: *Cloud seeding(Hygroscopic).

In a cold cumulus seeding experiment in New Mexico in 1969 silver iodide seeding resulted in more small raindrops and generally fewer large raindrops in light rain. Also, the seeded clouds tended to have higher maximum rainfall rates. Two hygroscopic seeding experiments were run on warm cumuli off the Florida coast and in Oklahoma. The maritime Florida clouds were modified by encapsulated urea seeding so that the initial surge of large raindrops at the beginning of showers was displaced toward the middle of the life of the seeded showers. The slope of the raindrop spectra of the seeded Florida clouds was less steep, implying more large drops and fewer small drops. Even though the raindrop spectra are significantly different, the difference is not large enough to cause a significant difference in the radar reflectivity-rainfall rate relationship. The continental warm cumuli in Oklahoma were not apparently affected by the hygroscopic seeding; however, the seeding amount was appreciably smaller. (Knapp-USGS)

Air Force Foreign Technology Division Translation Report FTD-HT-23-804-73, September 1973. 14 p, 1 tab, 20 ref. (Translated from Trudy v Vsesoyuznogo Meteorologicheskogo S Yezda, Sektsiya Aktivnykh Vozdeystviy na Atmosfernyye Protsessy, Vol 4, p 87-96, 1972).

Descriptors: *Cloud seeding, *Weather modification, Cloud physics, Mathematical models, Storm structure, Precipitation(Atmospheric).
Identifiers: *USSR(Ukraine), *Cumulonimbus clouds.

Cumulonimbus clouds may play a major role in artificial control of precipitation over the steppe area of the Ukraine. In the steppe of the Ukraine, developed cumulonimbus clouds have considerable thickness. Their summits are at an altitude of 6-7 km and higher; the temperature at the level of the summit, as a rule, is below -20 deg. A theoretical model was developed to describe the precipitation formation process in cumulonimbus, providing for calculation of total precipitation falling from a cloud during its natural development or during modification. To check the model, field experiments were performed, as a result of which information on total precipitation from seeded and unseeded clouds was obtained. (Knapp-USGS)

3C. Use Of Water Of Impaired Quality

EFFECT OF DETERGENT-LADEN WATER ON THE GROWTH OF CORN,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Agronomy.
W. Kroontje, J. N. Judy, and H. C. H. Hahne.
Available from the National Technical Information Service as PB-233 331, $3.75 in paper copy, $1.45 in microfiche. Virginia Water Resources Research Center, Blacksburg, Bulletin 62, August 1973. 50 p, 5 fig, 22 tab, 25 ref. OWRR A-041-VA(3).

Descriptors: *Detergents, *Waste treatment, Plant Growth, Crop production, *Corn(Field), *Growth rates, *Loam, Soil types, *Regression analysis, *Water reuse.
Identifiers: Norfolk fine sandy loam, Davidson clay loam, Plant yields.

A greenhouse experiment was conducted to determine the effects of two detergents on the growth of corn (Zea mays L.) when the detergent was individually applied to Davidson clay loam and Norfolk fine sandy loam. The detergents used were a heavy-duty non-enzyme detergent (Bz) and a heavy-duty enzyme detergent (Tx). These were applied in irrigation water at concentrations of 0, 20, 800, 1600, 4800, 8000, 10,000, 12,000 and 14,000. Stimulations in growth occurred on the Davidson soil that received 1600 ppm Bz and 800, 1600, 4800, and 8000 ppm Tx, and on the Norfolk soil that received 800 ppm Tx. These stimulations were attributed to responses to phosphorus contained in the detergents. Abnormal growth characteristics were observed on many treatments, and yield decreases were noted on the Davidson soil that received 8000, 10,000, 12,000 and 14,000 ppm Bz and 14,000 ppm Tx. Regression analyses showed that the detrimental effects on plant yields were due to soluble salt damages caused by the sodium in the detergents on all treatments except where Tx was applied to the Norfolk soil. In the latter case, specific sodium effects could not be separated from general salinity effects. Detergent Bz was more detrimental to plant growth than Tx.

HUMIDITY EFFECTS ON YIELD AND WATER RELATIONS OF NINE CROPS,
Agricultural Research Service, Riverside, Calif. Salinity Lab.
G. J. Hoffman.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 16, No 1, p 164-167, January-February, 1973. 2 fig, 3 tab, 12 ref.

Descriptors: *Humidity, *Crop response, Mist, Moisture, Precipitation(Atmospheric), Water vapor, Yield equations, Water utilization, *Salt tolerance.

The effect of humidity on the growth, yield, and water relations of nine crops grown under essentially the same controlled environmental conditions is described. Having essentially the same environment makes comparisons among crops possible. The data have been taken from various experiments conducted at the U.S. Salinity Laboratory to establish the interaction between atmospheric relative humidity and the salt tolerance of the crop. All the data reported are from nosaline treatments. The results are therefore independent of salinity. (Skogerboe-Colorado State)

CONTINUOUS SIMULATION MODELS IN URBAN HYDROLOGY,
Organization Stanford Univ., Calif.
R. Linsley, and N. Crawford.
Geophysical Research Letters, Vol 1, p 59-62, May 1974. 2 fig, 10 ref.

Descriptors: *Simulation analysis, *Urban hydrology, *Storm runoff, Planning, Management, Probability, Information retrieval, Rainfall, Hydrographs, Storage, Volume, Streamflow, Water quality, Water quantity, Flood control, Channels, Storm drains, Design, Watersheds(Basins), Hydrologic data, Computer models, Systems analysis.
Identifiers: Flowcharts, Peak flow.

Continuous hydrologic simulation is defined and the Hydrocomp Simulation Program, a version of the Stanford Watershed Model, is described. The information needs for urban water management systems are discussed and the use of continuous simulation of hydrologic data in meeting these information needs is reviewed. The most important information for dealing with problems of urban storm runoff and urban storm runoff quality is the probability of occurrence of events of various magnitudes. This information is readily obtainable through the use of continuous simulation models. It is not obtainable with discrete event simulation models based on the assumption that the probability of the runoff event is equal to the probability of the rainfall event which caused it. A TEST OF ALTERNATIVE MODELS FOR PROJECTING COUNTY INDUSTRIAL

PRODUCTION AT THE 2, 3, AND 4-DIGIT STANDARD INDUSTRIAL CODE LEVELS,
Livingston Coll., New Brunswick, N.J.
M. R. Greenberg.
Regional and Urban Economics, Vol 1, No 4, p 397-417, 1972. 1 fig, 5 tab, 38 ref. OWRR C-1629 (No. 3147) (5).

Descriptors: *Appreciation, *Estimating, *Projections, Model studies, Regional economics, *Economic prediction, New York, Water supply, Waste disposal.
Identifiers: *New York Region.

A series of projection techniques designed to estimate the value added by 42 industries in the 23-county New York Region are examined, and alternative combinations of models which consider industrial mixes, regional and intraregional shares are explored. Four potential projection paths--direct county output projections, regional output estimates allocated to county, national value added projections directly allocated to counties, and national projections allocated to the region, then to the county, were considered with the last chosen because of its reliability and limited data requirements. National coefficients developed by the Bureau of Labor and Statistics are utilized, with alternative assumptions as to unemployment, capital investment, and demand, to create a national input-output matrix yielding individual industries' growth rates. To apportion national value added estimates to the region, industries are first classified as to residentiary or supply characteristics utilizing the population ratio, one of the five methods considered. To extrapolate regional shares, variations of the constant share of national output and shift-share techniques are illustrated. Four methods, constant share, shift-share, extrapolation of absolutes output and regression were used to allocate regional shares to the counties. Data problems of each method are explored. Identifiers: *Continental shelf.

Predicted doubling of energy requirements suggests a growing need to develop U.S. offshore reserves where 50% of the remaining potential oil and gas supplies lie. The U.S. Energy Outlook Study, source of this report, provides 1971-1985 projections of U.S. energy demand, supply, and financing requirements. Under alternative supply forecasts, the average primary fuel unit revenue required to support various levels of exploration and development is computed. Assuming an intermediate energy requirement, a number of conclusions can be drawn. Domestic energy supplies, presently providing 88% of U.S. requirements may in the future provide between 62-89% of future requirements. By 1985 oil imports are estimated to provide 6-33% of energy requirements and 18-65% of total oil supply. Capital requirements covering all aspects of oil and gas development are expected to range between $88-172 billion over the period to 1985. Lead time requirements are also expected to increase. Impacts of alternative governmental taxing or leasing policy are also evaluated. No future leasing of the remaining 14 million coastal acres could lead to major declines in total domestic production. Removal of the cash bonus payments presently required could lead to price declines of $1.14-$1.33/oil barrel or 9.2 cents-12.3 cents/1000 cu. feet. (Schroeder-Wisconsin)

Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 100, No IR2, Paper No 10626, p 179-199, June 1974. 5 fig, 5 tab, 36 ref.

Descriptors: *Irrigation programs, *Irrigation efficiency, *Optimum devesedment plans Evapotranspiration, *Droughts, Scheduling, Soil water, Vegetation, Seasonal, Corn(Field) Research, Measurement, Systems analysis.
Identifiers: *Production functions, *Prediction, Growth characteristics, Production engineering.

Maximum water-use efficiency often occurs at irrigation levels still lower than the maximum profi point. A methodology is presented for predictior of optimal irrigation programs at any given level o irrigation water supply. The prediction is based o analysis of: (1) Davis, California research finding concerning growth characteristics of the cro which influence maximum yield, evapotranspir tion (ET) requirement, soil water uptake, an response to ET deficits; and (2) measurements c climate, soil, and irrigation system performanc which influence the requirement for ET to be sur plied from irrigation, and the percentage of irriga tion water evapotranspired. An optimal progra maximizes profit or water-use efficiency. Pro gramming dates and depths of irrigations are ba on comparison of the estimated sequence of max imum ET rates throughout the season with th sequence of actual ET rates expected if no irrig tion is given. The difference constitutes an ex pected sequence of ET deficits which carefull programmed irrigations may alleviate fully or i part. Time relationships of corn leaf canopy an root system development researched at Davis ar combined with irrigation planning site measur ments of climate, soil, and soil water content t estimate the sequence of ET deficits. Measur ment of actual irrigation operational efficienc completes the needed information. (Bell-Cornell) W74-09476

ACCELERATED GROWTH IN AGRICU TURAL PRODUCTION AND THE INTERSE TORAL TRANSFER OF RESOURCES,
Cornell Univ., Ithaca, N.Y. Dept. of Agricultur Economics.
J. W. Mellor.
Occasional Paper No. 34, January 1972. 21 p, 1 ta

Descriptors: *Agriculture, *Productivity, *Capi mobility, Prices, Investment, Economic impa Industrial production, Taxes, Political constrain Institutional constraints.
Identifiers: Intersectoral resource flow.

Three areas of intersectoral resource flows are e amined. A historical view of the size and directi of intersectoral resource transfers and the impa

of various institutional devices facilitating such transfers are explored for Taiwan with comparisons to several developing and developed countries. For Taiwan, a table of intersectoral flows between the agricultural and nonagricultural sectors over 1895-1960 is presented. In 1911-20, 1921-25, 1950-55 and 1956-60, for example, the percent of agricultural sales or total agricultural production representing real resource transfers were 50, 30; 40, 25; 40, 20; and 24, 15%, respectively. Variations in transfers caused by institutional changes are identified. The impact of technical change such as new crop varieties, irrigation, and fertilizer use on intersectoral flows is explored. The impact depends on both the capital:output ratio associated with the technical change and the resultant change in consumption of the agricultural sector. The characteristics of technical changes are examined to determine the appropriate institutional devices to maintain the intersectoral transfer. Land taxes, or relative agricultural price declines are cited as preferable over variable input taxes even though political difficulties in utilizing the former exist. (Schroeder-Wisconsin)

ON THE PRESSURE CHAMBER TECHNIQUE FOR ESTIMATING LEAF WATER POTENTIAL IN SORGHUM,
Volcani Inst. of Agricultural Research, Bet-Dagan (Israel). Dept. of Agronomy.
A. Blum, C. Y. Sullivan, and J. D. Eastin.
Agron J. Vol 65, No 2, p 337-338, 1973. Illus.

Identifiers: *Leaf-water potential, *Pressure chamber technique, *Sorghum, Sorghum-bicolor.

The purpose of this work was to re-evaluate the pressure chamber technique for estimating leaf water potential in sorghum (Sorghum bicolor (L.) Moench), with special reference to problems associated with leaf sample crushing under pressure and pressure rate increase inside the chamber. Pressure chamber readings were compared to Spanner-type thermocouple psychrometer readings on leaves of 5 sorghum genotypes at several stages of growth. A leaf sample holder, constructed from Silicon rubber and accommodated into a brass flange, reduced leaf crushing under pressure. It was found that pressure chamber readings (xylem pressure) cannot be directly used as an estimate of leaf water potential, but should be corrected according to a calibration against a thermocouple psychrometer determination of leaf water potential. Different rates of pressure increase in the chamber affected the regression between xylem pressure and leaf water potential. The regression improved with a greater pressure rate increase as indicated by smaller error variance estimate. No differences were detected between genotypes in this regression. This technique is, therefore, useful if worked out according to a calibration curve at a standard rate of pressure increase.--Copyright 1973, Biological Abstracts, Inc.

Irrigation Age, Vol 6, No 10, p 10-14, 16, May, 1972. 1 fig, 4 tab.

Descriptors: *Irrigation practices, *Irrigation programs, Soil moisture, Crop response, Irrigation systems, Stress.

Proper irrigation scheduling becomes increasingly important when available water supplies are short and/or costly. With proper irrigation scheduling, improved crop yields can be obtained and, often more importantly, water-use efficiencies can be increased. Both timing and amount of irrigation affect water-use efficiency; however, research has shown timing has the greatest effect because at critical growth stages, excessive crop water deficit can irreversibly reduce the potential yield and quality of the crop. A concept which is useful in optimizing irrigation timing is stress day index (SDI). Various methods for irrigation timing, the SDI concept, how this concept is utilized for timing irrigations, and experimental results comparing the SDI concept with other irrigation timing methods are described. OPTIMIZING SURFACE IRRIGATION UNIFORMITY BY NONUNIFORM SLOPES,
CH2M-Hill, Redding, Calif.
G. M. Powell, M. E. Jensen, and L. G. King.
Paper No 72-721 presented at Winter Meeting of the American Society of Agricultural Engineers, December 11-15, 1972, Chicago, Illinois. 19 p, 6 fig, 22 ref.

Descriptors: *Irrigation, *Irrigation practices, Surface irrigation, Farrow irrigation, Irrigation design, Irrigation efficiency, Uniformity coefficient, *Slopes, Mathematical models, Computer models.

A mathematical computer model of surface irrigation was developed to consider nonuniform slopes and depth-dependent infiltration functions. The model is based on a predictor-corrector technique in which the advance for each time increment is predicted and the water surface profile computed. After computing surface and subsurface storage volumes, the predicted advance is adjusted by a volume balance correction procedure. The computation is fast and verification of the model with field data indicates the model is as accurate as measured input field parameters. The model was used to demonstrate the effect of slope profile on water distribution in furrow irrigation. A concave slope profile shows a significant improvement in water distribution over a uniform slope. A convex slope results in a significantly poorer distribution. The model can also be used to evaluate existing surface irrigated fields with uniform or nonuniform slopes. (Skogerboe-Colorado State)

PROPOSED IRRIGATION DISTRIBUTION SYSTEM FOR POND-POSO IMPROVEMENT DISTRICT (PL 984), KERN COUNTY, CALIFORNIA (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Bureau of Reclamation, Mid-Pacific Regional Office, Sacramento, Calif.
Available from the National Technical Information Service, Springfield Va. 22151 as EIS-CA-73-1741-F, $5.50 in paper copy. November 1, 1973. 62 p, 1 plate, 1 map, 3 append.

Descriptors: *Water resources development, *Environmental effects, *Water works, *Water management(Applied), *Irrigation engineering, *Agriculture, Water supply, *California, Water demand, Administration, Federal project policy, Project planning, Project purposes, Water yield improvement, Water users, Water quality, Water distribution(Applied).
Identifiers: *Environmental Impact Statements, *Kern Co.(Cal.).

The proposed project is for the construction of irrigation distribution systems consisting of lined and unlined canals, pipelines, pumping plants and related water works. The system would convey 67,000 acre-feet of water per year from the California Aqueduct to about 22,300 acres of District lands where a variety of truck and field crops are grown. An additional 23,400 acres will continue to be irrigated from ground water sources. The imported water supply would alleviate the ground-water overdraft, aiding in halting land subsidence and improving ground-water quality, making for continued use of the District lands for agricultural production. Drainage facilities are not anticipated to be required and no significant effect is forseen on the fish and wildlife populations. Only minor amounts of land will be removed and there is the possibility of a minor increase in mosquito population. Alternatives considered were maintaining the status quo, and obtaining the water supply from other sources. (Sutton-Florida)
W74-09263

BEACH EROSION CONTROL STUDY ON MANATEE COUNTY, FLORIDA (FINAL ENVIRONMENTAL STATEMENT).
Army Engineer District, Jacksonville, Fla.
Available from the National Technical Information Service, Springfield Va. 22151 as EIS-FL-73-1462-F, $4.00 in paper copy. September 6, 1973. 40 p, 21 append, 5 photo, 1 map.

Descriptors: *Beach erosion, *Erosion control, *Dredging, *Florida, *Environmental effects, Shore protection, Hurricanes, Accelerated erosion, Flood damage, Turbidity, Currents, Sea water, Bottom fauna, Littoral, Quartz, Silt, Ocean waves, Sea walls, Gulf of Mexico, Swimming, Tourism, Economic impact, Land use, Recreational demand, Land fills.
Identifiers: *Environmental Impact Statements, *Anna Maria Key(Manatee County-Fla.), Coastal waters, Fill permits.

The project of restoring 3.2 miles of eroded beach along the Gulf shore of Anna Maria Key, Manatee County, Florida is evaluated. Periodic nourishment will be required to compensate for erosion losses throughout the 50-year life of the project. About 940,000 cubic yards of material will be dredged from offshore and placed on the beach. The beach will be temporarily closed during construction operations. Dredging will temporarily degrade water quality, and will destroy most benthic animals in bottom sediments and cover those in the beach nourishment area. The basic alternative is to take no action and leave the beach in its present condition. This provides no relief from the problem of rapidly eroding beach and damage to shore structures caused by wind and wave action. Other alternatives such as groins, seawalls, and revetments were considered. Such structures alone are not conducive to the formation and retention of a recreational beach, and represent an obstruction to the natural environment. Except for the loss of limited quantities of marine fauna and commitment of labor resources during dredge and fill activities, no irreversible or irretrievable commitment of resources is expected. (Kelly-Florida)
W74-09264

MAINTENANCE OF THE NEWARK BAY, HACKENSACK AND PASSAIC RIVERS NAVIGATION PROJECT, NEW JERSEY (FINAL ENVIRONMENTAL STATEMENT).
Army Engineer District, New York, N.Y.
Available from the National Technical Information Service, Springfield, Va., 22151, as EIS-NY-73-0987-F, $4.00 in paper copy. February 9, 1973. 36 p, 6 map, 4 tab, 9 append.

Identifiers: *Environmental Impact Statements, *Newark Bay(N.J.), Hackensack River(N.J.), Passaic Rivers(N.J.).

This final environmental impact statement deals with the maintenance of the Newark Bay, the Hackensack and Passaic Rivers Navigation Project, in New Jersey. Before concluding that the project was within the environmental guidelines, the following were considered: environmental implications, social well-being, engineering, economic and other public interest considerations. The feasibility and repercussions of dredging for navigation purposes were emphasized, as the area is a major link in the northeast shipping corridor. Plans for the dredging and channelization were approved, noting the dense industrialization of the area and the dependency of a major portion of the Midwest upon unhindered access to the harbor. Fish and wildlife resources of the area were negligible since industrial and commercial activities and the discharge of sanitary effluent by local communities have already polluted the surrounding waters. Large amounts of polluting substances enter the water daily, especially from industrial sources. (Silber-Florida)

EL DORADO LAKE, WALNUT RIVER, KANSAS, VOLUME 1, (FINAL ENVIRONMENTAL STATEMENT).
Army Engineer District, Tulsa, Okla.
Available from the National Technical Information Service, Springfield, Va., 22151, as EIS-KS-72-5351-F-1. September 1972. 145 p, 42 tab, 29 fig.

Descriptors: *Kansas, *Environmental effects, *Reservoirs, *Surface waters, *Dams, *Flooding(Intentional inundation), Dam construction, Damsites, Water control, Backwater, Flood control, Water utilization, Water supply, Water storage, Stream flow, Wildlife, Water quality control, Recreation, Fisheries, Non-structural alternatives.
Identifiers: *Environmental Impact Statements, *Walnut River(Kan.).

Action involves construction of a dam and reservoir for El Dorado Lake located at river mile 100.2 on the Walnut River in Butler County, Kansas. Project purposes are flood control, water supply, water quality control, and recreation. Flooding and the resultant damages and epidemic threats will be significantly reduced. Water supply will contribute to the growth of the area. The lake will provide a needed recreational resource and increased fishing. About 8,000 acres will be permanently inundated. Fifty-four families living in the project area will need to be relocated as well as two cemeteries. Also, a state highway, several county roads, pipelines, powerlines, and telephone lines will need to be relocated. Some wildlife habitat will be lost and plant species composition will undergo some change. The alternatives include a combination of small lakes with a dry lake, levees, flood plain acquisition, flood plain management, and no action. (Sutton-Florida)
W74-09268

NEW MELONES LAKE STANISLAUS RIVER, CALIFORNIA: SUPPLEMENTAL DATA ON USE OF CONSERVATION YIELD (SUPPLEMENTAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Sacramento, Calif.
Available from the National Technical Information Service, Springfield Va., 22151, as EIS-CA-73-0122-F. January 1973. 215 p, 1 chart, 3 tab, 2 append, 1 map.

Descriptors: *Environmental effects, *Reservoirs, *Surface waters, *Dams, *Flooding(Intentional inundation), Dam construction, Damsites, Water control, Backwater, Flood control, Water utilization, Riparian rights, Water supply, Water storage, Water transfer, *California.
Identifiers: *Environmental impact statement, *New Melones Lake(Calif.).

Project includes the construction of a dam and the creation of a large reservoir on New Melones Lake, Stanislaus River, California. It is to be a part of the Central Valley Project (CVP) and the water yield will be disposed of as part of the Central Valley Project operations. The project will recognize all water rights as well as the existing and projected requirements for water supplies in the local areas adjacent to the Stanislaus River, both upstream and downstream from New Melones Dam. Any excess water will be available for export to other CVP service areas. It is estimated that 285,000 acre-feet of water will be made available by New Melones Reservoir. It is suggested that the availability of these water supplies will encourage urban developers to move onto more valuable agricultural lands. There will be some loss of wildlife habitat and some removal of land from agricultural use for canal and other water conveyance structure sites. Including the release of the full conservation yield downstream, seven alternative uses of the water are discussed as well as the expected impacts on the service areas. (Conko-Florida)
W74-09269

PORT VERDIGRIS 33, INC., VERDIGRIS RIVER, OKLAHOMA (FINAL ENVIRONMENTAL STATEMENT).
Army Engineer District, Tulsa, Okla.
Available from the National Technical Information Service, Springfield, Va., 22151, as EIS-OK-73-0603-F. November 6, 1972. 27 p, 2 fig, 2 tab.

Descriptors: *Environmental effects, *Docks *Channel improvement, *Navigation, *Industria plants, Land use, Economic impact, Bulkheads Piers, Excavation, Construction, Dredging Navigable waters, Hazards, Safety factors Agriculture, *Oklahoma.
Identifiers: *Environmental Impact Statements *Port Verdigris(Okla.), *Navigation obstructions.

The project calls for the construction of a barg docking facility parallel to the navigation channels The dock will be located on government property with the storage area located on adjacent privat property. The off-channel location will decreas chances of vessel collisions. The excavate material will be placed ashore to raise the eleva tion of the storage area, thereby reducing th vegetative productivity of the land. The noise leve will be raised due to the increase in traffic an commercial activity. Appearance of the area wi change from rural to industrial. Two adverse ef fects are foreseen. One is the loss of the excavate land area for the dock and the other is the loss o agricultural productivity due to change in land use

The only alternative considered was no development at all. (Conko-Florida)
W74-09270

BEAR CREEK PROJECT, TENNESSEE (FINAL ENVIRONMENTAL STATEMENT).
Tennessee Valley Authority, Chattanooga.
Available from National Technical Information Service Springfield, Va. 22151, as EIS-AL-73-0037-F. December 29, 1972. 248 p, 24 fig, 54 tab.

Descriptors: *Alabama, *Environmental effects, *Reservoirs, *Surface waters, *Dams, *Flooding(Intentional inundation), Dam construction, Damsites, Water control, Backwater, Flood control, Water utilization, Water supply, Water storage, Mussels, Streamflow, Watersheds(Basins), Floodways, Impoundments.
Identifiers: *Environmental Impact Statements, *Bear Creek(Ala).

Proposal is for the development of four reservoirs and four multiple-purpose dams in the Bear Creek watershed in northwest Alabama, and the construction of a nine-mile floodway. The environmental impacts will include shifts in land use in the project area, including the acquisition by the Tennessee Valley Authority (TVA) of 24,000 acres and the impoundment of some 69 miles of unregulated streams into four reservoirs. There will be unavoidable adverse effects on certain archaeological sites and on certain fish and wildlife areas, including a mussel bed containing a rare mussel species. The project will have an impact on stream-oriented ecosystems and certain water quality parameters as well as requiring the relocation of 68 families. Many of these losses will be offset or mitigated by the project. Alternative methods of providing water supply and flood control were considered, including alternative dam site locations. No alternative was found to be more feasible or to obtain the project purposes with less environmental impact. (Conko-Florida)

BUENA VISTA FLOOD PROTECTION PROJECT, BUENA VISTA, VIRGINIA (FINAL ENVIRONMENTAL STATEMENT),.
Army Engineer District, Norfolk, Va.
Available from National Technical Information Service, Springfield, Va. 22151, as EIS-VA-73-0336-F. December 1972. 49 p, 3 tab, 2 map.

Descriptors: *Virginia, *Environmental effects, Surface waters, *Levees, *Flood control, *Floodways, Water control, Water utilization, Water supply, Water transfer, Canals, Channels, Earthworks, Flood protection, Vegetation effects, Biota, Non-structural alternatives.
Identifiers: *Environmental Impact Statements, Buena Vista(Va.).

The project consists of an 11,700 foot levee and floodwall, a 200-foot wide channel 2,800 feet long, 5,700 foot interior drainage canal and three closures to provide flood protection. Construction will result in covering 65 acres of low use wildlife habitat, destruction of some associated vegetation the excavation area as well as on the river bank djacent to the channel and loss of benthic organms in channel improvement areas. There will so be some relocation of businesses, utilities, d transportation facilities, and a favorable effect the community resulting from flood protection. her adverse effects are loss of bottom biota and mporary turbidity during construction and riods of flooding. The alternative proposals considered included no development at all, construction of an upstream reservoir, a 300-foot channel, n-structural measures, and combinations of se. (Conko-Florida)
74-09272

AINTENANCE DREDGING AND JETTY PAIR, HAMPTON HARBOR, NEW HAMPSHIRE (FINAL ENVIRONMENTAL STATEMENT).
Corps of Engineers, Waltham, Mass.
Available from National Technical Information Service, Springfield, Va. 22151, as EIS-NH-73-0605-F. September 5, 1972. 56 p, 2 tab, 3 map.

Descriptors: *New Hampshire, *Environmental effects, *Dredging, *Navigable waters, *Sand bars, Aquatic life, Biota, Benthos, Channel improvement, Marine animals, Marine biology, Harbors, Oceans, Reefs, Shallow waters, Channels, Navigation, Recreation, Alternative planning, Obstructions to flow, Coasts.
Identifiers: *Environmental Impact Statements, *Hampton Harbor(N.H), *Coastal waters.

The project is for the removal of a sand bar across the outer portion of the entrance channel, and rehabilitation of the north jetty at Hampton Harbor, New Hampshire. The proposal includes removal of the sand bar on an annual basis thereafter. Approximately five to eight days are needed to remove the sand plus time for repairs to the jetty. Action will enable continued safe passage of recreational and commercial vessels through Hampton Harbor inlet. Adverse effects include temporary, localized damages to the marine biota, particularly non-burrowing, benthic forms, attributable to dredging and spoiling operations. No perdurable detriments to the ecology or beaches of Hampton Harbor area are foreseen from this action. Alternate methods of dredging and disposal are discussed as well as consideration of no action. (Conko-Florida)
W74-09273

MAINTENANCE DREDGING, CHATHAM (STAG E) HARBOR, MASSACHUSETTS (FINAL ENVIRONMENTAL STATEMENT).
Corps of Engineers, Waltham, Mass.
Available from National Technical Information Service, Springfield, Va. 22151, as EIS-MA-73-0604-F. July 12, 1972. 43 p, 2 tab, 3 map.

Descriptors: *Massachusetts, *Environmental effects, *Dredging, *Navigable waters, *Sand bars, *Sedimentation, Channel improvement, Marine animals, Harbors, Oceans, Reefs, Channels, Shallow waters, Coasts, Shoals, Silting, Sedimentation rates, Navigation, Obstruction to flow.
Identifiers: *Environmental Impact Statements, *Chatham Harbor(Mass.).

The proposal is for maintenance dredging in the lower portion of the 10-foot navigation channel of Chatham (Stag E) Harbor, Massachusetts. The proposed periodic dredging would take place from deep water in Chatham Roads and extend to the Harding Beach peninsula. Approximately 20,000 cubic yards of bottom sediment (sand) would be removed. If sidecast dredging is used, shoal material would be cast along the periphery of the channel. This will allow safe navigation into the harbor to continue. The local economy is dependent on harbor utilization, and the U.S. Coast Guard requires an open, navigable entrance into the harbor. No perdurable detriment to the natural resources of the harbor is expected and only temporary and localized damages are expected to occur in the work areas. The only alternatives are no dredging, or using another method of dredging such as hydraulic dredging which would spoil the sand in upland areas, or bucket dredging which would require dumping the sand offshore. (Conko-Florida)

REPORT OF PROCEEDINGS CONCERNING THE RECLASSIFICATION OF VARIOUS STREAMS IN NORTH CAROLINA, SECTION III, KINSTON PUBLIC HEARING MARCH 1, 1973.
North Carolina Board of Water and Air Resources, Raleigh.
July 1973. 230 p, 16 tab.

Descriptors: *River basin development, *River regulation, *Tributaries, *Water policy, *Water zoning, Water pollution control, Water quality control, Planning, Legislation, Watershed management, Water resources development, Drainage systems, Legal aspects, River systems, Rivers, River basin commissions, Classification, *North Carolina, Administrative agencies.

This report is the third in a series of three records of public hearings concerning state-wide proposals for upgrading the quality of surface waters in sixteen river basins by appropriate changes in their classification. This report contains copies of all materials, briefs, and letters presented, as well as the transcript of the proceedings, at the Kinston, North Carolina public hearing on March 1, 1973. Included are sections of the Laws of North Carolina relating to the policy of the state concerning its water resources and the assignment of classifications to surface waters within the state. Also included are the Rules Applicable to Classifications and Water Quality Standards adopted by the North Carolina Board of Water and Air Resources. Discussion at this hearing concerned the classification of streams in the Neuse River Basin, the Tar-Pamlico River Basin, the White Oak River Basin, the Pasquotank River Basin, the Chowan River Basin, and the Roanoke River Basin. (Craig-Florida)
W74-09275

REPORT OF PROCEEDINGS CONCERNING THE RECLASSIFICATION OF VARIOUS STREAMS IN NORTH CAROLINA, SECTION II, SOUTHERN PINES PUBLIC HEARINGS NOVEMBER 2, 1972.
North Carolina Board of Water and Air Resources, Raleigh.
July 1973. 278 p, 10 tab.

Descriptors: *River basin development, *River regulation, *Tributaries, *Water policy, *Water zoning, Water pollution control, Water quality control, Planning, Legislation, Watershed management, Water resources development, Drainage systems, Legal aspects, River systems, Rivers, River basin commissions, Classification, *North Carolina, Administrative agencies.

This is the second in a series of three records of public hearings concerning state-wide proposals for upgrading the quality of surface waters in sixteen river basins by appropriate changes in their classification. This report contains copies of all materials, briefs, and letters presented, as well as the transcript of the proceedings, at the Southern Pines, North Carolina public hearing on November 2, 1972. Included are sections of the Laws of North Carolina relating to the policy of the state concerning its water resources and the assignment of classifications to surface waters within the state. Also included are the Rules Applicable to Classifications and Water Quality Standards adopted by the North Carolina Board of Water and Air Resources. Discussion at this hearing concerned the classification of streams in the Yadkin-Pee Dee River Basin, the Lumber River Basin, and the Cape Fear River Basin. (Craig-Florida)
W74-09276

PRINCIPLES AND STANDARDS FOR PLANNING WATER AND RELATED LAND RESOURCES.
Water Resources Council, Washington, D.C.
38 Fed. Reg. 24778 (1973), 192p.

Descriptors: *Water resources development, *Watershed management, *Water quality control, *Water pollution control, *Water supply, Standards, Land resources, Water resources, Water demand, Water conservation, Long-term planning, Water quality, Water policy, Environmental effects, United States.

The Water Resources Council announces the establishment of Principles and Standards for Planning Water and Related Land Resources, pursuant to section 103 of the Water Resources Planning Act (P.L. 89-80). Several areas of revisions from the original Principles and Standards are set forth. These include planning objectives, the discount rate, retroactive application of the 'Grandfather Clause,' cost allocation, public participation and water quality evaluation. Further areas of revision include the use of economic projections, unemployed and under employed resources, the application of benefit to cost ratio, the preparing of feasible project alternatives, and the impact of benefits on income distribution. The Principles, Standards, and Procedures are discussed individually, analyzing each area's purpose and scope, objectives, beneficial and adverse impacts, general evaluation principles, its plan formulation, cost allocation, reimbursement and cost sharing, implementation procedure and its application and effect. The Standards cover almost every area of water and related land resources that have a major impact on society and were promulgated after extensive study and public response. The full texts of the Principles and Standards are published as a part of this notice. (See also W74-09279) (Sutton-Florida)
W74-09278

PRINCIPLES AND STANDARDS FOR PLANNING WATER AND RELATED LAND RESOURCES (FINAL ENVIRONMENTAL STATEMENT).
Water Resources Council, Washington, D.C.
Available from National Technical Information Service, Springfield, Va. 22151, as EIS-AA-73-1451-F. $3.00 in paper copy. September 4, 1973. 16p.

Descriptors: *Water resources development, *Water quality control, *Water supply, *Water conservation, *Water policy, United States, Legislation, Long-term planning, Discount rate, Cost allocation, Water resources, Land resources, Environmental effects, Water pollution control.

These Principles and Standards for Planning Water and Related Land Resources will supercede the present criteria, commonly known as Senate Document 97, 87th Congress 2nd session together with Supplement No. 1 (June 4, 1964), and the amendment of December 24, 1968, covering the discount rate. The Principles and Standards will be directed toward two objectives: national economic development and environmental quality. For each alternative plan, there will be a complete display or accounting of relevant beneficial and adverse effects on both objectives. These effects would be measured in monetary or quantitative units or terms appropriate to a particular effect. Also, for each alternative plan the effects on regional development and social well-being will be displayed where appropriate in the system of public information accounts. This system of accounts is summarized and the planning process is outlined. Cost allocation and reimbursement and program development are summarized. The evaluation process is set forth, and will provide for full display of all environmental impacts, favorable and adverse, as well as all irretrievable commitments of resources. FLOOD PLAIN INFORMATION: OHIO RIVER, BROOKE COUNTY, WEST VIRGINIA.
Army Engineer District, Pittsburgh, Pa.
Prepared for The Brooke County Planning Commission and the State of West Virginia, Department of Natural Resources, December 1971. 25 p, 14 fig, 6 tab, glossary.

Descriptors: *Flood plains, *Flood control, *Ohio River, Flood damage, *Flood profiles, Flood protection, *Flood frequency, Flood data, Locks, Dams, Gaging, Flood forecasting, Obstructions to flow, *West Virginia.
Identifiers: Brooke County(W. Va), Intermediate Regional Flood, Pike Island Locks and Dam(W. Va).

Brooke County is situated on the east bank of the Ohio River from Mile 64.75 to Mile 81.50 downstream of Pittsburgh, Pennsylvania. Wellsburg and Follansbee are the major towns with steel, sheet metal, tin, plate, coal, glass and plastic as principal industries. The Ohio River has a total drainage area of 203,940 square miles. Residences and industries have been built in the floodplain over the decades undeterred by recurring floods. Above Brooke County the Ohio River has a moderately wide floodplain and a relatively flat river gradient (a slope of 0.5 foot per mile for the report reach). In Brooke County there are no tributaries that have a significant effect on flood stages. Gage records have been kept from 1911 to the present. The main flood season is usually December through April. Flood duration is relatively long. The major obstruction to flood flows is the Pike Island Locks and Dam, which is equipped with gates allowing underpassage of flow. Fourteen upstream flood control projects operated by the Corps of Engineers are effective in reducing flood levels from 6 to 9 feet. No floodplain regulations or flood proofing building codes are now in effect in Brooke County. The most serious recorded flood for this area occurred on March 19, 1936, after 2 days for heavy rains. Wellsburg, suffering the greatest loss in Brooke County, was approximately three-fourths under water. Approximately one-fourth of Follansbee was flooded. A flood of only slightly lesser gravity came on December 31, 1942. Flood control dams prevented this disaster from surpassing the 1936 flood. On March 11, 1964 another major flood occurred. A projected Intermediate Regional Flood would have a peak discharge of 394,000 cubic feet per second with damage estimated at $6,000,000. (LaPointe-North Carolina)
W74-09354

FLOOD PLAIN INFORMATION; POCOTALIGO RIVER-TURKEY CREEK-CANE SAVANNAH CREEK-GREEN SWAMP-SHOT POUCH CREEK-ROCK BLUFF SWAMP, SUMTER COUNTY, SOUTH CAROLINA.
Army Engineer District, Charleston, S.C.
August 1972. 31 p, 57 fig, 7 tab, glossary.

Descriptors: *Flood data, *Design flood, *Regional flood, Flood profiles, Flood damage, Peak discharge, Flood forecasting, Historic floods, Overflow, Flood profiles, Floodwater, *South Carolina.
Identifiers: Pocotaligo River(S.C.), Turkey Creek(S.C.), Cane Savannah Creek(S.C.), Green Swamp(S.C.), Shot Pouch Creek(S.C.), Rocky Bluff Swamp(S.C.), Sumter County(S.C.).

While properties along Pocotaligo River, Turkey Creek, Cane Savannah Creek, Green Swamp, Shot Pouch Creek, and Rocky Bluff Swamp vary from concentrated residential and commercial development to heavily wooded swampland, most of the floodplain is presently undeveloped. Areas which would be flooded by Intermediate Regional and Standard Project Floods are delineated on maps. During an Intermediate Regional Flood, peak flows along selected points range from 9,700 to 11,000 cfs on Pocotaligo River; from 4,940 to 6,500 cfs on Cane Savannah Creek; from 3,000 to 5,200 cfs on Green Swamp; from 5,170 to 5,340 on Rocky Bluff Swamp; from 1,300 to 3,820 on Turkey Creek; and from 1,680 to 2,965 on Shot Pouch Creek. During a Standard Project Flood, peak flows along selected points range from 16,050 to 18,000 cfs on Pocotaligo Creek; from 8,450 to 11,100 cfs on Cane Savannah Creek; from 5,120 to 8,900 cfs on Green Swamp; from 8,870 to 9,130 cfs on Rocky Bluff Swamp; from 2,070 to 6,000 cfs on Turkey Creek; and from 2,870 to 5,000 cfs on Shot Pouch Creek. Water velocity patterns are similar for all streams with channel velocities varying from 1 to 3 feet per second and overbank velocities rarely exceeding 2 feet per second. Pertinent structural elevations and water surface elevations are given for each of the 36 bridges and culverts that span the six streams. Water surface profiles of the Intermediate Regional and Standard Project Floods are also included. (Hoffman-North Carolina)
W74-09355

FLOOD PLAIN INFORMATION; WILKESBORO AND NORTH WILKESBORO, NORTH CAROLINA; YADKIN RIVER AND REDDIE RIVER.
Army Engineer District, Charleston, S.C.
January 1971. 51 p, 27 fig, 10 tab, glossary.

Descriptors: *Flood data, Flood profiles, *Design flood, *Regional flood, *Flow control, *Flood control, Flood damage, Flood forecasting, Historic floods, Overflow, Floodwater, Peak discharge, Dams, *North Carolina.
Identifiers: Yadkin River(N.C.), Reddie River(N.C.), W. Kerr Scott Dam(N.C.), Reddie River Dam(N.C.), Wilkesboro(N.C.).

Above Wilkesboro and North Wilkesboro, the Yadkin River drains an area of 493 square miles, including the 96 square mile drainage basin of the Reddies River. W. Kerr Scott Dam, located on the Yadkin River 5.5 miles above Wilkesboro, controls the runoff from 348 square miles. The Reddies River, presently uncontrolled, is capable of producing a serious flood. Congress has authorized a multi-purpose project for the Reddies River basin. Under proposed future conditions, W. Kerr Scott Dam and the Reddies River Dam will both fully control the Intermediate Regional Flood at their respective sites. An Intermediate Regional Flood could result from rainfall concentrated over the 50.5 square mile drainage area between Wilkesboro and the two damsites. Neither dam could fully control a Standard Project Flood: W. Kerr Scott Dam would allow a peak outflow of 29,000 cfs and the Reddies River Dam would allow a peak outflow of 10,500 cfs. Under existing conditions peak discharges during an Intermediate Regional Flood would be 61,500 cfs on the Yadkin River and 36,200 cfs on the Reddies River. An Intermediate Regional Flood would flood 1,294 acres, including 250 structures along the Yadkin River and 95 acres, including 19 structures, along the Reddies River. A Standard Project Flood would flood 1,673 acres, including 368 structures, along the Yadkin River and 180 acres, including 33 structures, along the Reddies River. Regulation by the Reddies River project would reduce the respective areas of coverage by approximately 14%. Water surface profiles under existing conditions and with regulation by the proposed Reddies River Dam are included. (Hoffman-North Carolina)
W74-09356

FLOOD PLAIN INFORMATION; KIT AND NORTHEAST CREEKS; RESEARCH TRIANGLE AREA, DURHAM AND WAKE COUNTIES, NORTH CAROLINA.
Army Engineer District, Wilmington, N.C.
June 1973. 20 p, 10 fig, 15 plates, 5 tab, glossary.

Descriptors: *Flood data, *Design flood, *Regional flood, Flood damage, Peak discharge, Flood forecasting, Overflow, Flood profiles, Floodwater, *North Carolina.
Identifiers: Kit Creek(NC), Northeast Creek(NC), Research Triangle Area(NC).

The Research Triangle Area, a 5,000 acre tract located between the University of North Carolina at Chapel Hill, North Carolina State University at Raleigh, and Duke University in Durham, is being developed for industrial and governmental research and development facilities. At present with 5% of the land developed, 75% woodland, and 20% agricultural, only highway bridges and a few buildings would be affected by flooding. Since no flood discharge or stage records are available for Kit or Northeast Creeks, flood potential was extrapolated from data on regions of like topography and watershed cover. Total drainage area of Northeast Creek and North Prong, a tributary, is approximately 34 square miles; total drainage area for Kit Creek, 10.2 square miles. Development in the lower reach is precluded by present construction of New Hope Lake Project. As the Triangle expands the flood plain will come under increasing pressure for commercial development. A Standard Project Flood would flood 1,029 acres, including 13 structures along Northeast Creek, 110 acres, including 5 structures along North Prong Northeast Creek and 426 acres along Kit Creek and Branch South. An Intermediate Regional Flood would flood 813 acres, including 4 structures along Northeast Creek, 82 acres, including 1 structure along North Prong Northeast Creek, and 328 acres along Kit Creek and Branch South. Underclearance elevation, lowest elevation of roadway, and water surface elevation during Intermediate Regional Floods and Standard Project Floods are detailed for all bridges and culverts. Photographs indicate possible levels of future flooding. (Hoffman-North Carolina)
W74-09357

FLOOD PLAIN INFORMATION; REEDY RIVER, RICHLAND CREEK, GREENVILLE COUNTY, SOUTH CAROLINA.
Army Engineer District, Charleston, S.C.
April 1972. 42 p, 20 fig, 28 plates, 7 tab, glossary.

Descriptors: *Flood data, *Design flood, *Regional flood, *Flood profiles, Flood damage, Peak discharge, Flood forecasting, Overflow, Floodwater, Historic floods, *South Carolina.
Identifiers: Reedy River(SC), Richland Creek(SC), Greenville County(SC).

Properties along Reedy River and Richland Creek vary from intense urban development in downtown Greenville, where past floods have caused considerable damage to homes and industries, to woodland and pastureland in the reaches north and south of town. It is expected that future urban expansion will increase development on the floodplain, thus magnifying the effect of flooding. Reedy River and Richland Creek generally rise swiftly during floods and remain out of their banks for at least 24 hours. Velocities of main channel flow would vary from 3 to 9 feet per second during an Intermediate Regional Flood, with velocity of flow slightly higher during a Standard Project Flood. Peak flows along selected points on Reedy River range from 3,300 to 13,000 cfs during an Intermediate Regional Flood and from 7,500 to 27,300 cfs during a Standard Project Flood. Peak flows along selected points on Richland Creek range from 2,380 to 3,500 cfs during an Intermediate Regional Flood and from 5,440 to 8,000 cfs during a Standard Project Flood. Underclearance elevation, lowest elevation of roadway, and water surface elevation during Intermediate Regional and Standard Project Floods are detailed for the 49 bridges and culverts that span the two streams. Overflow areas are delineated on maps. Water surface profiles of Intermediate Regional and Standard Project Floods are also included. (Hoffman-North Carolina)

RAIN FLOOD DISCHARGE IN NORTHEASTERN SLOPES OF KOPET-DAG (USSR), (IN RUSSIAN),
Desert Inst., Ashkhabad (USSR).
B. T. Kirsta.
Probl Osvoeniya Pustyn'. 2. p 32-38, 1973, Illus, English summary.
Identifiers: *Flood discharge, Irrigation, Permeability, Rain floods, Slopes, Soils, *USSR(Kopet-Dag), Water sources.

The number of floods varies from 1-15/yr. They occur annually in drainage systems consisting of soil very impermeable to water. It is more advantageous to use flood waters for replenishment of underground water resources. Therefore stable irrigation of vast areas is lacking.--Copyright 1974, Biological Abstracts, Inc.

RECORDING FLOODS AND FLOOD DAMAGE,
Geological Survey, Reston Va.
W. Hofmann.
Highway Research Record, No 479, p 40-41, 1973.

Descriptors: *Flood data, *Data collections, *Hydrologic data, Basic data collections, Floods, Peak discharge, Stream gages, Surveys, State-discharge relations, Flood frequency, Flood recurrence interval.

The Geological Survey has the responsibility for recording the state, discharge, and areal extent of floods. Major floods are documented by collecting data in the field and then by reporting the data so that they are available to those who need the information. The areal extent of the flooding is delineated through field surveys and photogrametrically. At gauge sites, continuous water stages and periodic discharge measurements are collected. (See also W74-09390) (Knapp-USGS)

PROBABILITY DISTRIBUTION OF EXTREME FLOODS,
Geological Survey, Reston, Va.
C. H. Hardison.
Highway Research Record, No 479, p 42-45, 1973. 2 fig, 1 tab, 2 ref.

Descriptors: *Floods, *Probability, *Historic floods, *Flood frequency, *Flood recurrence interval, Statistics, Statistical methods, Flood data, Flood forecasting, Frequency analysis.

Two aspects of the unusually large floods experienced in 1972 are discussed: how such large floods affect the computation of the 50-year peak and how these floods plot on a probability distribution of extreme floods based on analysis of 157,000 annual peaks at about 200 stream gauging stations. Weight factors are given to be used in computing 50-year peaks both with and without extreme floods included. For 10 of the stations affected by the 1972 floods associated with Hurricane Agnes, the use of the recommended Log-Pearson Type III (LPT3) procedure with observed peaks through 1972 results in 50-year peaks that average three times as large as the 50-year peaks computed without including the Agnes floods. Even when generalized logarithmic skew coefficients were substituted for the sample skew coefficients in the LPT3 computations, the 50-year peaks at these 10 stations averaged about 80 percent larger with the Agnes floods than they did without. When an annually high flood is included in an array of flood peaks, computation of the 50-year peak by the LPT3 procedure should use a generalized skew coefficient and considerable weight should be given to the 50-year peak computed with the highest peak deleted from the array. Extension above the 50-year peak should be a straight line on log probability paper to about the 1,000-year probability level, but the slope should be based in part on the average slope at all stations in the area. Floods that are more than two standardized units above the 50-year peak are so rare that their exceedance probability (less than one in 4,000) is comparable to that for damage caused by other natural disasters such as earthquakes, landslides, and tornadoes. (See also W74-09390) (Knapp-USGS)
W74-09398

DESIGN CRITERIA AND RESEARCH NEEDS,
Hydrologic Engineering Center, Washington, D.C.
V. Hagen, W. Hofmann, F. L. Johnson, S. V. Fox, and B. M. Reich.
Highway Research Record, No 479, p 54-64, 1973. 2 fig.

Descriptors: *Design flood, *Flood forecasting, *Bridges, *Highways, Roads, Disasters, Risks, Design, Planning.

The occurrence of an extreme flood event, such as Hurricane Agnes, requires careful review of flood prevention activities. Flood events in excess of the design flood will occur somewhere each year. It is not possible, because of money constraints, to build all structures to pass the biggest flood that might happen in that location. So, the only answer appears to be to build highways so that extensive damage will not occur, either to the highway or to other property. (See also W74-09390) (Knapp-USGS)

ENVIRONMENT: A NEW FOCUS FOR LAND-USE PLANNING.
National Science Foundation, Washington, D.C.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402 Price $2.95. Report NSF/RA/E-74-001, October 1973, 328 p (Edited by Donald M. McAllister).

Descriptors: *Land use, *Urbanization, *Environment, *Comprehensive planning, Suburban area, *Research priorities, *Land management, Economics, Evaluation, Governmental interrelations, Institutions.

This book is divided into four parts. Part I presents the recommendations of high-priority research for land-use planning and allocation that were developed by the workshop participants. Part II contains an introductory chapter and historical overview of land-use planning in the United States. Part III comprises a collection of nine papers devoted to various topics concerning the social, economic, and natural environmental factors important to environmental/land-use planning. They were prepared in advance of the conference to serve as background papers for the work at the conference. Part IV contains six committee reports which were prepared during the conference. LAND-USE RESEARCH ISSUES SUGGESTED BY A NATIONAL URBAN GROWTH STRATEGY,
Massachusetts Inst. of Tech., Cambridge. Dept. of Urban Studies and Planning.
L. Rodwin, and L. Susskind.
In: Environment: A New Focus for Land Use Planning, National Science Foundation, Washington, D.C., Report NSF/RA/E-74-001, p 127-142, October 1973. 24 ref.

Descriptors: *Urbanization, *Land use, *Planning, *Research priorities, *Federal government, Coordination, State government, Local government, City planning, Management.
Identifiers: Urban growth strategy, Metropolitan decentralization.

Federal inactivity in developing a national growth policy has left a severe vacuum in attempts to organize metropolitan growth, to develop lagging regions, and to establish ethnic autonomy. State and local governments, however, have had and will continue to have a major role in implementing a national urban growth strategy. Certain research implications merge from such a strategy. First, what kind of incentives and on what scale can they be established to produce significant effects in metropolitan growth. Second, can a few growth centers be established to focus new regional development, and can assistance be provided for the populations of regions where development is infeasible. Thirdly, since racial and ethnic considerations will become a major factor in land use planning, what new characteristics and options must be considered. Concrete research problems include the assessment of the impact of urban growth strategies, linking decentralization of major urban areas to the promotion of lagging regions, the use of the new town device as a reinforcement of urban growth centers, and employing the powers of state governments to implement urban growth strategies and to address environmental concerns. There is a pressing need for a coordinated set of national policies so that lower level, day to day, administrative decisions can be justified by a meaningful set of principles. CONFLICTS IN LAND USE,
Ross, Hardie, O'Keefe, Babcock, McDugald and Parsons, Chicago, Ill.
In: Environment: A New Focus for Land Use Planning, National Science Foundation, Washington, D.C., Report NSF/RA/E-74-001, p 143-155, October, 1973.

Descriptors: *Legal aspects, *Land use, *Land development, *Research priorities, Zoning, Local governments, Equitable apportionment, Benefits, Costs, Migration, Administration.
Identifiers: No-growth policies, Housing, Urban design, Miami Valley Region(Ohio), Boulder(Colo.), San Bernadino(Calif.), Ramapo(N.Y.).

Most debates over public policy on land use involve relationships between three parties: (1) the owner of the land; (2) the local government directly concerned over the development of the land; (3) those interests which may be affected by decisions made by either of the first two parties. Useful legal solutions need to be developed that would redistribute benefits and liabilities between public expenditures and private development of land. Legalization of urban design is also a problem. Public decision makers are faced with a system of land-use regulation based upon Euclidean zoning employing rigid rules for lot size criticized as encouraging sterile design, or Planned Unit Development allowing greater flexibility in design. Additional legal techniques of land-use regulation need to be developed to provide alternatives to static solutions possible through zoning and encourage more diversity of housing, commercial uses, and population mix. The Miami Valley Region (Ohio) and San Bernardino Region are areas that have tackled the problem of distributing the burden of low cost housing among all constituent communities. Communities like Boulder, Colo. and Ramapo, N.Y., that have established no growth policies will need to consider whether they can achieve ecological goals and simultaneously provide needed low cost housing and related services. Consideration must also be given to whether planning and implementation at the regional or state level is impaired. Future conflicts may arise

out of the present policy of open migration, construction of megastructures, and concepts of the family where the modular of the traditional family unit may be replaced by communal living or other forms of relationships. (See also W74-09412) (LaPointe-North Carolina)

AN EVALUATION OF THE IMPACT OF LAND USE ON ENVIRONMENTAL QUALITY,
Argonne National Lab., Ill. Center for Environmental Studies.
E. J. Croke.
In: Environment: A New Focus for Land Use Planning, National Science Foundation, Washington, D.C., Report NSF/RA/E-74-001, p 217-231, October, 1973. 1 tab, 14 ref.

Descriptors: *Land use, *Evaluation, *Environment, *Planning, Air pollution, Water pollution, Clean Air Act, Federal Water Pollution Control Act, Land development, Standards, River basin development, Federal jurisdiction, Institutions, Regional development.
Identifiers: Assimilative capacity, National standards.

Recent federal legislation such as the Federal Clean Air Act (1970) and the Water Pollution Control Act have mandated pollution control plans reflecting the spatial distribution of pollutant sources for metropolitan regions and river basins. Such plans would necessitate the substitution of a comprehensive land use policy for the present technologically oriented pollution control strategy which is seriously hampered by rapid development. Any environmental land use policy would have to consider the relationship between the assimilative capacity of an area and environmental quality standards. For example, large quantities of toxic industrial wastes may be contaminating New Jersey groundwater due to an inability to assimilate the wastes. Lake Tahoe and Atlanta are cited as two areas where regional development plans have included constraints due to assimilative capacity. Current national environmental strategy, however, tends to disregard the particular assimilative capacities of different areas by establishing national emission and environmental quality standards. Current land development policy, with projects having a 25-30 year economic lifetime can often lead to socioeconomic irreversibility of the consequent environmental problems. Highway systems, airports, and the land development and population distribution they engender are cases in point. In order to insure the inclusion of environmental control in land use decisions by states and localities the federal government has a wide variety of incentives and disincentives at its disposal including the withholding of granting of funds for transportation systems, water treatment facilities and energy distribution systems. WATER PROBLEMS IN THE ARID WESTERN REGIONS OF THE USA, (IN RUSSIAN),
I. S. Zonn.
Probl Osvoeniya Pustyn'. 2. p 39-48. 1973. Illus. English summary.
Identifiers: Agriculture, *Arid lands, Cloud seeding, Ground water depletion, Irrigation, *Water utilization, *Western U.S., Desalination, Saline water, Thermal water, Inter-basin transfer.

In the western USA the available water resources are utilized completely, and in arid regions lack of water is considerable. Ground water is depleted primarily by agricultural irrigation. Investigations are under way to enable more economical use of the available water resources (cloud seeding, desalinization of saline underground and sea waters, utilization of thermal waters, and intra- and inter-basin water transference.)--Copyright 1974, Biological Abstracts, Inc.

USE OF DECISION THEORY IN RESERVOIR OPERATION,
British Columbia Univ., Vancouver. Dept. of Civil Engineering.
S. O. Russell.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY6, Paper No 10586, p 809-817, June 1974. 3 fig, 6 ref.

Descriptors: *Canada, *Demand, *Forecasting, Hydraulics, *Multiple-purpose reservoirs, *Reservoir operation, Methodology, Lakes, Flow, Snowmelt, Runoff, Discharge(Water), Water levels, Flood control, Storage, Irrigation water, Water supply, Systems analysis, Mathematical models, *Risks.
Identifiers: Rule curves, *Decision theory, Bayes' theorem, Subjective probability, Okanagan Lake(British Columbia-Canada), Utility curve, Decision tree.

A method is presented for deciding how to most efficiently operate a multipurpose reservoir which is subject to conflicting demands. The method is based on decision theory and can be used to derive reservoir rule curves when flow forecasts are unavailable or to provide guidance in real time on what is best to do when forecast information is available. Because of the complexity of the real situation, the Bayes' theorem cannot be applied formally--decision theory cannot be applied directly. However, the underlying approach is believed to be 'Bayesian' in that it uses subjective probability estimates of future inflows obtained from the hydrologist, a utility curve obtained from the decision maker, and it seeks to maximize expected utility at all times. A special bridge between theory and practice has been devised. The procedure is illustrated by application to the Okanagan Lake in British Columbia, a lake which is operated as a reservoir for both flood control and storage of water for irrigation purposes. The method does not eliminate the need for experience and judgement on the operator's part, but be making the process explicit it should help the decision maker in using all the available information in a rational and consistent way. WATER AND LAND SLIDES,
Paul Sabatier Univ., Toulouse (France). Lab. of Botany and Biogeography.
M. M. Lorilland.
Bull Soc Hist Nat Toulouse. Vol 108, No 1/2, p 248-254, 1972. Illus.
Identifiers: Climates, *France(Garonne-Ariege rivers), *Land slides, Maintenance, Rocks, Soils, Stream, Vegetation.

Observations and experimentation on land slides in the vicinity of the Garonne and Ariege Rivers were carried out at Toulouse-Pouvourville, Vieille-Toulouse, Portet-sur-Garonne, Lacroix-Falgarde and Goyrans, France. Related factors include terrain, geological, topographical, pedological and climatic conditions. The rock of the region is of the Marn-Molasse type, with intercalated veins and lentils of clay and sand. The veins and sandy lentils permit infiltration and subterranean circulation of waters arising from stream action, which diminishes the resistance of the rock to unfavorable forces. A talus at the foot of the hill, which is often directly bathed by river water, is an outlier of slide phenomena. The main climatological concerns are conditions of excessive winter and spring rains, which affect pedological conditions, and are the essential determining agent in slides; and summer drought which does not eliminate the instability created by the precipitation, and which harms protective vegetation. Studies carried out in 1959-1969 revealed a relationship between slides and the amount of precipitation of the preceding months. Most slides occurred at the end of spring, after accumulation of winter and spring rains. Slides occurring in late autumn or early winter are more easily explained on the basis of the imbibement of high river waters. Swollen rivers due to melting mountain snow in the spring are undoubtedly an important factor in slide production. Topographical factors (maintenance of the natural vegetation cover) are also important.--Copyright 1974, Biological Abstracts, Inc.

EXPERIMENTAL FIELD STUDIES REQUIRED FOR THE DESIGN OF DRAINAGES, (STUDII EXPERIMENTALE IN TEREN, NECESARE PROIECTARII DRENAJELOR),
A. Wehry.
Hidrotehnica, Vol 18, No 11, p 586-589, November, 1973. 2 ref.

Descriptors: Engineering structures, *Drainage systems, *Drainage engineering, Irrigation ditches, Lateral conveyance structurs, Model studies, *Mathematical studies.
Identifiers: *Hooghoudt's method, *Ernst's method.

Calculation methods necessary for conducting experimental field studies before designing drainage systems are presented. Presented are views of the drainage structures, pressure loss representation, the nomogram for calculating the value according to Hooghoudt, the ground water level representation during and after irrigation and the experimen-

tal value H=f(t) representation. In order to calculate the distance between drains, Hooghoudt and Ernst's methods are most often used. In order to apply the nomograms, it is necessary to know hydraulic conductivity of the earth layer. This value can be obtained only by a field study. Also, porosity and drainage intensity must be known. Equations are provided for various field situations and examples of calculations are given. (Urbanski - FIRL)

RAIN RESERVOIRS AND RAIN OVERFLOWS (REGENBECKEN UND REGENENTLASTUNGEN),
W. Muntz.
Gas-Wasser-Abwasser, Vol 53, No 9, p 293-300, September, 1973. 7 fig, 1 tab, 7 ref.

Descriptors: *Rainfall-runoff relationships, *Rainfall intensity, Rain, Rates, Runoff, Sewers, *Watersheds(Basins), Canals, Treatment, *Waste water treatment.

Problems of the design and dimensioning of rain reservoirs and rain overflows are discussed. Canal overflows without rain reservoirs serve to release stormwater directly into the recipient whenever a critical throughflow is reached. Rain overflow basins bypassing the wastewater treatment facility assume a similar role, while rain overflow basins connected in series with the wastewater treatment facility serve to protect the latter to preserve its purifying capacity. Rainwater retention basins retain stormwater for subsequent treatment. While most stormwater overflow basins are currently designed for a minimum critical rain intensity of 15 liter/sec, this critical value should be now increased to 25-30 liter/sec, and even to 40-50 liter/sec for especially protected recipients and for water capture areas. Rain reservoirs should be designed for flow times of 5 to 15 minutes. Increased flow time results in increased reservoir volume per ha, and in reduced final pollutant concentration. Attenuation of the initial pollutant load peak in watershed areas was determined. (Takacs-FIRL)

THE INFLUENCE OF DRAW-DOWN ON RECREATION ON THE TRENT CANAL RESERVOIR-LAKES,
Toronto Univ. (Ontario). Faculty of Forestry.
R. Jaakson.
Water Resources Bulletin, Vol 9, No 6, p 1225-1233, 1973. 4 ref.

Descriptors: *Water level fluctuations, *Duty of water, *Recreation, *Jurisdiction, *Drawdown, Effects, Attitudes, Reservoirs, Competing uses, Legal aspects, Political aspects, Canals, Planning, Multiple-purpose projects, Decision making, Water utilization, Water rights, Riparian rights, Shores, *Canada.
Identifiers: *Trent Canal(Ontario).

The multiple purposes of many water related projects are often conflicting. The Trent Canal in Ontario, Canada, a 240-mile recreational waterway of canals, navigable lakes, and rivers, provides a unique opportunity to study two conflicting water uses, both involving recreational activities. The Canadian Federal government currently manages the 44 adjacent lake-reservoirs as water storage sites to augment the canal's flow. The major recreational users of the lakes are cottage owners while boaters are heavy consumers of recreational activity on the canal. Drawdowns, sometimes to the level of 13 feet, to maintain boating create negative externalities to cottage owners. Twelve of the 44 lakes were chosen as study sites with three water bodies outside the region used as controls. In depth interviews with 5% of cottage owners on the lakes--115--to examine the impact of drawdown were conducted. Results indicate that previously hypothesized values of the externalities were exaggerated, with drawdowns on infrequently dry years only likely to cause a significant impact. Owners were found to readily adapt to changes in water levels, thereby not leading to a severe curtailment of recreational activity. Shoreline physiography of cottage sites was shown to significantly affect owners' reaction to the drawdowns. (Schroeder-Wisconsin)

ECOLOGICAL RIVER BASIN MANAGEMENT,
National Parks and Conservation Association, Washington, D.C.
A. W. Smith.
The Environmental Journal, Vol 46, No 3, p 1-4, 1972.

Descriptors: *Ecology, *Environmental effects, Dams, Watershed management, Reservoirs, *River basin development, Irrigation, *Flood plain zoning.

The address by the President and General Counsel of the National Parks and Conservation Association presented before the 1971 Seventh American Water Resources Conference contends that the major objectives of water resources management, and specifically river basin management, as currently practiced by government agencies and regulated utilities in the United States are outmoded and destructive. The focus of criticism is the big dam and the concomitant reservoir, for over 75 years the basic tool in river basin management. The failure of this tool for irrigation, water supply, flood control, hydroelectric power, and pollution abatement programs is examined. Of even greater concern, in addition to the failure of the big dam and reservoir to achieve goals set by river basin planners, is the ecological damage created by these structures. Farm land is reduced by inundation, communities, homes, churches, cemeteries, and historical sites or buildings have been destroyed or forced to relocate. Alternatives to the big dam concept exist. Included in those discussed are flood plain zoning, small local reservoirs, and pollution abatement at the source. (Schroeder-Wisconsin)

AN EXPERIMENTAL STUDY OF DRAINAGE BASIN EVOLUTION AND THE INFLUENCE OF LANDFORMS ON HYDROLOGIC VARIABLES,
Colorado State Univ., Fort Collins. Dept. of Earth Resources.
S. A. Schumm, and R. S. Parker.
Available from NTIS, Springield, Va. 22151 as AD-767 284, Price $2.75 printed copy; $1.45 microfiche. Final contract report to Army Research Office Report, September 1, 1973. 17 p, 2 fig, 2 tab. DA-ARO-D-31-124-70-G13.

Descriptors: *Geomorphology, *Model studies, *Hydraulic models, Erosion, Channel morphology, Topography, Rainfall-runoff relationships, Drainage patterns(Geologic), Sediment yield.

To study drainage evolution, a scale model was designed and constructed at Colorado State University during 1970. During two experimental seasons, (summer 1971, 1972) the evolutionary development of small drainage systems was documented by photography and mapping. The response of the drainage systems to baselevel change was recorded, and during the evolution of the systems, from inception of the drainage patterns, through maximum growth to eventual reduction of drainage density, hydrologic data were collected. These data have been related to the changing morphology of the evolving drainage system. (Knapp-USGS)

GEOLOGY AND QUALITY OF WATER IN THE MODESTO-MERCED AREA, SAN JOAQUIN VALLEY, CALIFORNIA, WITH A BRIEF SECTION ON HYDROLOGY,
Geological Survey, Menlo Park, Calif.
R. W. Page, and G. O. Balding.
Geological Survey Water-Resources Investigations 6-73, September 1973. 85 p, 28 fig, 12 tab, 67 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater, *Water quality, *California, Geology, Hydrologic data, Hydrogeology, Aquifer characteristics, Water wells, Well data, Water yield, Streamflow, Geomorphology, Surface-groundwater relationships, Water utilization, Water supply, Irrigation, Chemical analysis.
Identifiers: *San Joaquin Valley(Calif), *Modesto-Merced area(Calif).

The Modesto-Merced area, California, includes about 1,800 square miles on the northeast side of the San Joaquin Valley. The physiographic units in the area are (1) Sierra Nevada, (2) dissected uplands, (3) low alluvial plains and fans, (4) river flood plains and channels, and (5) overflow lands. At least three groundwater bodies occur in the area: (1) the unconfined water body, (2) the confined water body, and (3) the water body in consolidated rocks. Groundwater in the unconfined water body generally is moderately hard east of U.S. Highway 99 and hard to very hard west of Highway 99. However, a corridor of moderately hard water is present west of U.S. Highway 99 along the Merced River. Water in the confined water body ranges from soft to very hard. Surface

water in the area differs in chemical quality because of differences in size and location of drainage basins, amounts of precipitation, types of rocks in drainage basins, spills from irrigation water and industrial and domestic development along a given river or stream. The few analyses of water from minor streams indicated that the water was of a bicarbonate type and that it was comparable to or better than that in the major rivers. Water from major rivers ranged in chemical type from calcium bicarbonate to sodium chloride. (Woodard-USGS)
W74-09605

RIVER REGULATIONS AS INFLUENCE ON PEAK DISCHARGE,
International Engineering Co., Inc., Denver, Colo.
Barton, Stoddard, Milhollin and Higgins Div.
A. F. Huggins, and M. R. Griek.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY7, Paper 10671, p 901-918, July 1974. 11 fig, 7 tab, 5 ref, 2 append.

Descriptors: *Peak discharge, *Regulation, *Flood control, *Reservoirs, *Colorado River, Colorado, Regulated flow, Diversion, Design flood.

River regulation materially affects the magnitude of peak flood discharge in a river basin. Peak flow in the upper Colorado River basin is primarily from snowmelt runoff. The first significant regulation occurred in 1936 with the inauguration of the Moffat Tunnel and in 1942 with the completion of Green Mountain Dam. Three analytical approaches were used to determine the amount of reduction in peak flow resulting from regulation. Utilizing river flow data during the years 1900-1968, a 50-yr flood flow of 31,000 cfs was computed whereas the series 1942-1968 yields 22,800 cfs, a 30% flow reduction, Regional analysis of adjacent watersheds indicated a 10% reduction attributed to climatic conditions. An analysis of tributaries in the basin indicated a 20% reduction in unit contribution resulting from controls. These approaches gave support for the recommendation of a design flow reduced 20% from the peak discharge computed over the longer period of record. (Knapp-USGS)

OPTIMAL DESIGN FOR HIGHWAY DRAINAGE CULVERTS,
Meta Systems, Inc., Springfield, Va.
G. K. Young, M. R. Childrey, and R. E. Trent.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY7, Paper 10676, p 971-993, July 1974. 13 fig, 5 tab, 30 ref, 2 append.

Descriptors: *Design flow, *Culverts, Economics, *Virginia, Highways, Hydraulics, Risks, Probability, Hydraulic design.

Economic risks are directly considered in an optimal design procedure for box culverts. Flood related losses are computed on a probabilistic basis to derive economic risks for box culvert design. The components of the economic risk are damage to upstream property, damage to the embankment and roadway, and damage to the culvert. An optimal design is reached when the construction costs plus the economic risks are minimum. The design procedure was applied to 22 sites on stream crossings in Virginia. Based on this economic risk procedure, curves were developed which suggest variable return period criteria for conventional design practice. For the conventional situations, construction cost savings on the order of 50% are indicated for the reinforced concrete barrels of the optimal design. (Knapp-USGS)

Descriptors: *Flood protection, Dams, Flood recurrence interval, Channels, *Flood control, Flood routing.
Identifiers: *Austria(Vienna), *Danube River.

The flood protection project being constructed in the Vienna, Austria, area is described. The dams will be elevated, and double protection will be consequently built up around Vienna to meet floods occurring at an estimated frequency of one in every 10,000 years. A flood release channel diverts up to 5,000 cu meters water per second whenever the yield in the Danube exceeds 5,000 cu m/sec. The areas around Vienna not belonging to the urban agglomeration will have a flood protection system designed for a flood frequency of one in every 1,000 years. (Takacs-FIRL)

GROUND-WATER DATA, 1972, INDIAN WELLS VALLEY, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
R. L. Banta.
Open-file report, August 1973. 12 p, 5 fig, 1 tab, 3 ref.

Descriptors: *Water levels, *Groundwater, *California, Data collections, Hydrologic data, Water wells, Drawdown, Withdrawal.
Identifiers: *Indian Wells Valley(Calif).

Water-level measurements were made in about 110 wells in Indian Wells Valley, California, in October 1972. The average water-level declined 3.5 feet in six wells between October 1971 and October 1972. The total pumpage from Indian Wells Valley during 1972 was about 15,200 acre-feet, an increase of about 6 percent over 1971. Water samples were collected from 67 wells in Indian Wells Valley in 1972 for chemical analysis. Principal constituents determined in the analyses are listed. (Knapp-USGS)

Geological Survey, Harrisburg, Pa.
D. J. Growitz.
Open-file report, December 1973. 4 p, 1 fig, 1 tab.

Descriptors: *Water levels, *Groundwater, *Pennsylvania, *Water level fluctuations, Data collections, Hydrologic data, Hydrogeology, Flooding.
Identifiers: *Kingston(Penn).

An observation-well network and surface-water measuring points were established to monitor fluctuations of groundwater and surface-water levels near Kingston, Pennsylvania. Water-level elevations of both surface water and groundwater are generally highest in the spring and lowest in the fall. The objectives of this study are to determine the source and movement of groundwater and the seasonal fluctuation in groundwater levels in order to delineate areas in and adjacent to Kingston where basement flooding occurs and to determine the severity of the flooding. In addition, factors that control the surface and subsurface routing of water are to be determined, so that methods to alleviate flooding can be proposed and evaluated. (Knapp-USGS)

ANALYTICAL MODEL FOR MANAGEMENT OF ALLUVIAL AQUIFERS,
Colorado Dept. of Natural Resources, Denver. Div. of Water Resources, Planning and Investigations.
R. Qazi, and J. Danielson.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 100, No IR2, Paper no 10627, p 143-152, June 1974. 5 fig, 1 tab, 4 ref.

Descriptors: *Alluvial aquifers, *Wells, *Pumping, *Water management(Applied), *Simulation analysis, *Computer models, Groundwater, Flow, Water table, Reservoir storage, Recharge, Rivers, Surface waters, Conjunctive use, Water delivery, Water supply, Damages, Drawdown, Canals, Irrigation water, Municipal water, Computer programs, Equations, Evaluation, Systems analysis, *Colorado.
Identifiers: Stream depletion, Water augmentation, South Platte River(Colo.), Algebraic summation.

Under the doctrine of prior appropriation, the recent inclusion of wells in the existing priority system of water rights in Colorado has created new problems for water management in tributary alluvial aquifers. Irrigation and municipal wells, generally subordinate to surface water rights on a river, are subject to complete shut down if they cannot compensate for the river depletion due to pumping; to shut these wells off could mean economic disaster to large rural areas in Colorado. Therefore, augmentation plans have been accepted by the Division of Water Resources whereby well owners must provide for river depletion in both time and space either by recharge operations or by direct deliveries to the river from acquired surface water. To evaluate these plans, an analytical approach using computer simulation has been derived to estimate the change in storage of the groundwater and the rate and amount of movement of water to and from the river. The model, presented in detail, can provide quick estimates of the volumetric movements and the fluctuation of the water table due to any combination of wells, recharge lines, or pit operations in an alluvial (unconfined) aquifer. Model applications to the South Platte River in Colorado, and results, are discussed. Compared to other conjunctive use models, this does not require voluminous amounts of input data. (Bell-Cornell)

(WATER WELL CONTRACTOR SURVEY).
Water Supply Management, Barrington, Ill.
1971, 21 p, 59 tab.

Descriptors: Wells, *Groundwater, *Surveys, Publications, Statistical methods, Estimating, Investigations, *Drilling, *Water wells, Irrigation wells, *Well data.
Identifiers: Domestic wells, Industrial wells, Waste disposal wells, Livestock supply wells.

A profile is presented of the driller market with regard to 6,100 water well contractors, and their buying habits, their attitudes about products and well industry issues, and the types of wells they drilled in 1969. Buying habits and attitudinal material are presented as national composite figure only; a breakdown into nine geographical areas allow regional information to also be reported for well numbers, depths and diameters drilled, rigs used, pumps installed, and casing and screening used per well type. Data are reported for the following well types: municipal; industrial; domestic; livestock supply; irrigation; sprinkler system; air conditioning system supply; waste disposal; other miscellaneous types of wells. A 10 per cent national reply was received, and served as the basis for projections on well numbers nationally and for each area. (Martino-NWWA)

GROUND-WATER CONDITIONS CAUSED BY TROPICAL STORM AGNES,
Susquehanna River Basin Commission, Mechanicsburg, Pa.
J. R. Hollowell.
Pennsylvania Geology, Vol 2, No 5, p 2-9, April 1974. 7 fig.

Descriptors: *Groundwater, *Flood damage, Building codes, Hydrographs, Hurricanes, Water level fluctuations.
Identifiers: *Groundwater flooding, *Susquehanna river basin, *Tropical storm Agnes.

Hydrographs from U.S. Geological Survey observation wells in the Susquehanna River Basin were analyzed to determine ground-water response to tropical storm Agnes. The amount and intensity of the rainfall associated with the tropical storm was sufficient to create all-time high water levels in most of the observation wells. Four hydrographs are presented to show how topography was a major factor in the water-level fluctuations caused by the tropical storm. From these data the geologic and topographic settings subject to ground-water flooding were recognized and delineated. (Staplin-NWWA)

O AND M COSTS: PAY NOW OR PAY LATER,
National Water Well Association, Houston, Tex. Research Facility.
M. D. Campbell, and S. N. Goldstein.
Water Well Journal, Vol 28, No 2, p 26-27, 66-68, February 1974.

Descriptors: *Operation and Maintenance, *Rural areas, Management, Economics, Wells, *Operating costs, *Maintenance costs.
Identifiers: Water systems, Cost efficiency, Support companies, Well longevity.

The operation and maintenance of rural water systems is discussed in terms of economics and availability to rural residents. National Demonstration Water Project (NDWP) is now experimenting with a regional management approach to operation and maintenance that is designed to provide low-cost, dependable service to rural areas. NDWP affiliate projects are forming support companies that provide operation and maintenance services such as: (1) billing and collecting, (2) sampling and testing, (3) contracting, (4) inspecting facilities and water quality and (5) providing consulting and training programs. A cost breakdown showing the amount spent on operation and maintenance for a typical small rural company is given. Routine operation and maintenance procedures will often extend the life of a rural water system resulting in a long term savings in the total cost of the system. (Staplin-NWWA)

J. T. Johnson, and J. Thrailkill.
Journal of Hydrology, Vol 20, No 4, p 327-333, December 1973. 1 fig, 1 tab, 12 ref.

Descriptors: *Wells, *Water wells, *Groundwater, Aquifers, Statistical methods, *Limestone, Geology, Beds(Stratigraphic), Hydrology, Areal hydrogeology, Stratigraphy, Lithology, Water supply, Water pollution, Saline water, *Kentucky.
Identifiers: *Centerville Quadrangle(Ky), Synclines, Anticlines, Non-parametric tests.

Ten variables were examined using non parametric statistical tests (Mann-Whitney U and chi square) to evaluate the influence of these variables on ground water supply in the Centerville Quadrangle, Kentucky. Variables found to be significant were those directly related to lithology (wellhead stratigraphy and well-bottom stratigraphy) and those interpreted as being strongly influenced by lithology (well depth, wellhead elevation, and

well-bottom elevation). In addition, wells judged adequate for water supply were closer to surface streams and bottomed closer to stream level than dry holes. Adequate wells were also closer to synclinal axes than dry holes. There was no significant difference between dry holes and adequate wells in their distance from sinkholes or regional structural position. Wells producing H2S-containing water differed from adequate wells only with regard to variables related to lithology but saline-water wells were more abundant in areas distant from surface streams as well as in unfavorable lithology. HYDRAULIC TESTING AND SAMPLING OF HOLES RB-E-01 AND RB-D-01, PROJECT RIO BLANCO, RIO BLANCO COUNTY, COLORADO,
Geological Survey, Lakewood, Colo.
J. E. Weir, Jr.
Available from NTIS, Springfield, Va. 22151 - Price $3.00 printed copy; $1.45 microfiche. Contract Report USGS-474-150, (Rio Blanco-1) for US Atomic Energy Commission, November 1972. 28 p, 6 fig, 2 tab, 3 ref. USAEC Contract AT(29-2)-474.

Descriptors: *Aquifer testing, *Water yield, *Water wells, *Colorado, Aquifers, Confined water, Water levels, Transmissivity, Hydrogeology, Hydrologic data, Sampling, Water quality.
Identifiers: *Rio Blanco County(Colo).

The discharge of water was monitored during drilling of two holes (RB-E-01 and RB-D-01) at the Rio Blanco site in western Colorado. Recovery of water level was measured following periods of water withdrawal from hole RB-D-01. Two intervals of hole RB-D-01 were tested. Zone 1, from 245 to 845 feet below land surface, has a transmissivity of about 4,600 gallons per day per foot and a static water level of 59.90 feet below land surface. Zone 2, from 882 to 1,651 feet below land surface, has a transmissivity of about 200 gallons per day per foot and a static water level of 39.63 feet below land surface. There is potential at hole RB-D-01 for flow of water upward from zone 2 to zone 1; however, differences in quality of water in the two zones indicate that water probably does not circulate freely between the zones. OPTIMAL PUMPING FOR AQUIFER DEWATERING,
Stanford Univ., Calif. Dept. of Geology.
E. Aguado, I. Remson, M. F. Pikul, and W. A. Thomas.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY7, Paper 10639, p 869-877, July 1974. 5 fig, 1 tab, 3 ref, 2 append.

Descriptors: *Dewatering, *Mathematical models, *Drawdown, Linear programming, Excavation, Withdrawal, Groundwater movement, Drainage engineering, Finite element analysis.

A method is presented for determining the optimal well locations and steady-state pumping scheme for dewatering a construction site. It uses the finite-difference approximations of the groundwater differential equation as constraints in a linear programming model. The method was used to determine optimal well distributions and steady-state pumping patterns for dewatering a dry dock excavation site. Because the method is restricted to steady-state solutions, auxiliary use was made of the transient numerical model to predict dewatering times. Solutions of alternate optimization problems may be achieved readily. For example, it might be desirable to restrict the number of wells or restrict their locations. It might be desirable to consider economic factors. Such solutions may be achieved with modifications of constraints or objective functions. (Knapp-USGS)

Descriptors: *Groundwater, *Water utilization, *Water supply, *Human population, *Urbanization, Cities, Water wells, Rocks, Geologic time.
Identifiers: *USSR(Irkutsk Oblast).

The Irkutsk Oblast has vast supplies of fresh groundwater suitable for use. Various organizations in the Oblast have drilled more than 2,000 boreholes for water, about 1,800 of which are being exploited. The number of wells in the Oblast is 15,400, and the number of springs is over 200. Usable groundwater can be found in deposits of varying ages, ranging from young Quaternary to ancient Archean, inclusive. Conditions are favorable for obtaining fresh groundwater in the Irkutsk, Kachug, Nizhneudinsk, Tayshet, and Tulun Rayons. In almost all populated areas in these regions fresh groundwater occurs at depths rarely exceeding 100 m, and well productivity averages 0.5 to 10 liters/sec at slight drawdown. Less favorable are water-supply conditions in the Zalari, Kuytun, Ust'-Uda, Cheremkhovo, Alarskiy, Bokhan, and Ekhirit-Bulagatskiy Rayons, where fresh groundwater is either nonexistent or exploratory work and exploitation conditions are difficult. Water supply conditions are also unfavorable in populated areas removed from the zone of inundation of the Bratsk Reservoir. Cities in the Irkutsk Oblast which have a centralized water supply are Irkutsk, Angarsk, Shelekhovo, Usol'ye-Sibirskoye, Cheremkhovo, and Bratsk. Water supply of these cities has until now been entirely based on surface waters, although attempts have been made to use groundwater. Outside these cities water supply is decentralized and is based mainly on surface waters and waters of Quaternary deposits, the quality of which, in most coses, fails to meet water-quality standards. Groundwater of bedrock is being used in small towns and urban settlements. Exploratory work is underway to convert the population of the Oblast to use of groundwater for its water supply. ANTIMONY IN GROUNDWATER OF THE KADAMDZHAY DEPOSIT (SUR'MA V PODZEMNYKH VODAKH KADAMDZHAYSKOGO MESTOROZHDENIYA),
Tomsk Polytechnic Inst. (USSR).
N. M. Shvartseva.
Akademiya Nauk SSSR Doklady, Vol 207, No 5, p 1220-1222, 1972. 1 fig, 1 tab, 13 ref.

Descriptors: *Geochemistry, *Water chemistry, *Mineralogy, *Groundwater, Water types, Water sampling.
Identifiers: *USSR(Kadamdzhay deposit), *Antimony, Antimonite, Mineralization.

Distribution of antimony in water was investigated at the surface and in joints, solution openings, and fracture zones of the Kadamdzhay antimony depost. Antimony was found in all water samples in relatively large concentrations. Its concentration in water related to ore mineralization does not exceed 128 micrograms/liter, whereas that in water unrelated to ore mineralization reaches 5,750 micrograms/liter, averaging 2,845 micrograms/liter. High antimony concentrations in neutral and mildly alkaline waters of the Kadamdzhay deposit show that antimonite is readily dissolved under specific conditions, possible under the influence of autotrophic organisms. This promotes widespread leaching of antimony beyond the deposit and formation of aqueous dispersion halos in the Shakhimardan River, where the antimony concentration decreases gradually away from the deposit. The size of these aqueous dispersion halos reaches 1.5 km. (Josefson-USGS)

4C. Effects On Water Of Man'S Non-Water Activities

FLOOD SURVEY AT PROPOSED TAPS CROSSING OF YUKON RIVER NEAR STEVENS VILLAGE, ALASKA,
Geological Survey, Anchorage, Alaska.
J. M. Childers, and R. D. Lamke.
Open-file report, 1973. 12 p, 4 fig, 1 tab, 7 ref.

Descriptors: *Floods, *Alaska, *Pipelines, Scour, Stage-discharge relations, Design flood, Historic floods, Erosion, Surveys.
Identifiers: *Trans-Alaska Pipeline, *Yukon River(Alas).

A flood survey and a hydraulic analysis were made at the proposed pipeline and highway bridge crossingof the Yukon River, Alaska. The Maximum Evident Flood at the proposed crossing, section 6, was 890,000 cu ft per sec at an elevation of 301 feet. The Standard Project Flood (or design flood), at 1,600,000 cu ft per sec, will reach an elevation of 322 feet at the proposed crossing. No ice-jam evidence was found. No significant scour or fill occurs at high flow. (Knapp-USGS)
W74-09405

THE EFFECTS OF LAND USE ON SALMON PRODUCTION,
Alaska State Dept. of Fish and Game, Juneau.
S. C. Smedley, K. E. Durley, and C. C. Larson.
Available from NTIS, Springfield, Va 22151 as COM-73-10895 Price $3.00 printed copy; $1.45 microfiche. Completion Report to National Marine Fisheries Service, July 1972, 82 p.

Descriptors: *Salmon, *Lumbering, *Water pollution effects, *Land use, Land management, *Alaska, Fisheries, Forestry, Forest management.

To assess the effects of land use (primarily logging) in Alaska on the salmon spawning environment, a monitoring program was initiated in 1963. Three major salmon streams, capable of handling escapements of 100,000 or more pink salmon per year, were chosen. These are Staney Creek and 108 Creek (also known as Big Creek) on the Kasaan District of the South Tongass National Forest and Kadashan Creek, Sitka District, 1968, North Tongass National Forest. Seven years of monitoring in 108 Creek of (1) adult pink salmon escapement, (2) streambed composition, (3) streambed stability, and (4) production of pink salmon fry, show a drop in adult escapements, marked increase of fine materials in the spawning grounds, a relatively stable streambed, a drop in pink salmon fry production, and a rise in percentage fry survival between eyed eggs and pre-emergence when adult spawners are relatively sparse. Equally important, these affects have been noted in a stable, lake-fed stream where logging and road building have been conducted under careful supervision. No careless practices have been tolerated. Land use was apparently unrelated to the initial drop in odd-year adult pink salmon runs and fry production. The drought year 1965 seems the primary cause of depression. High salmon egg deposition plus a high percentage of fine materials in 1964 and particularly in 1966 presumably created a BOD too high to be met, resulting in low fry survival and eventually a low 1968 adult return. Contributions of sediment to 108 Creek through small tributary streams were identified as coming from the road system and from logs skidding over and breaking tributary streambanks. Slumps in unlogged areas from the banks of 108 Creek also contributed significant suspended sediment load. A significant (1.3 to 1.4 deg F) increase in water temperature was found in the summer of 1966 and 1967 when compared with water temperatures of summers, 1964 and 1965. This increase might be ascribed to logging. (Knapp-USGS)

ROAD SALT, DRINKING WATER AND SAFETY,
Little (Arthur D.), Inc., Cambridge, Mass. Public Affairs Center.
R. C. Terry.
Ballinger Publishing Company, Cambridge, Mass. 1974. 159 p.

Descriptors: *Sodium chloride, Water quality, *Salt, *Ice, Snow, *Potable water, Deicers, Safety, Public health.
Identifiers: *Road salt, *Deicing.

An analysis is provided of the rapidly emerging health problems and medical concern over levels of sodium in both public and private water supplies which can be traced directly to de-icing practices. The development of the various winter road policies are reviewed, and the difficulties of present water quality standards are evaluated. A detailed discussion of the many variables which cause problems in setting reasonable salt-use policies is presented, and recommendations for local community programs and state-wide legislation are offered. CHARLESTON AREA SEDIMENT SAMPLES,
South Carolina Pollution Control Authority, Columbia.
H. E. Gibson.
In: Cooper River Environmental Study: South Carolina Water Resources State Water Plan Report No 117, p 105-118, April 1974. 7 fig, 4 ref, 1 append.

Descriptors: *Bottom sediments, *Estuaries, *South Carolina, Oxygen demand, Nitrogen, Oil, Mercury, Lead, Zinc, Sampling, Data collections, Pollutant identification.
Identifiers: *Charleston Harbor(SC), *Cooper River(SC).

Samples of sediment were collected in Charleston Harbor during August 1972 and delivered to Laboratory Services. Analyses were made between September and December. Volatile solids, chemical oxygen demand, total kjeldahl nitrogen, oil and grease, mercury, lead, and zinc were determined. (See also W74-09379) (Knapp-USGS)
W74-09386

SURVEY OF ENVIRONMENTAL RADIOACTIVITY, (JANUARY 1973-DECEMBER 1973).
Minnesota Dept. of Health, Minneapolis.
Available from NTIS, Springfield, Va., as COO-651-90 for $3.00 paper copy; $1.45 microfiche. Report No. COO-651-90, April 1974. 61 p, 8 fig.

Descriptors: *Surveys, *Minnesota, *Radioactivity, *Nuclear powerplants, *Effluents, *Data collections, Water pollution, Precipitation(Atmospheric), Surface waters, Sewers, Milk, Iodine, Cesium, Strontium, Radioisotopes, Public health, Rivers, Sampling, Analytical techniques.
Identifiers: *Elk River.

A surveillance program of the state of Minnesota includes the Elk River Reactor site during the dismantling of the Elk River Reactor. A considerable increase in radioactivity in all media analyzed occurred in the middle of 1961 due to fallout from nuclear weapons testing. The peak for gross beta activity in Minnesota surface waters was reached early in 1963. A peak for air particulates was reached in the latter half of 1961, followed by a second peak early in 1963. From 1963 to 1965, the general trends of radioactivity in precipitation, surface waters and air have been downward. Since 1965, levels of radioactivity in these media have generally stabilized. The activity in processed fluid milk reached a peak for iodine-131 in 1962. Since late 1963, iodine-131 in samples analyzed has been less than the minimum practical reporting limit of ten. Peaks for cesium-137 and strontium-90 occurred in processed fluid milk during 1963 and 1964, respectively. After a rapid downward trend, cesium-137 levels have stabilized. Levels of strontium-90 in processed fluid milk stabilized after a more prolonged period of decline than that observed for cesium-137. Detailed description of survey methods and sampling locations are included. (Houser-ORNL)

PESTICIDE ANALYSIS IN WATER,
Environmental Protection Agency, Springfield, Ill.
J. T. Hurley.
Journal of the American Water Works Association, Vol 66, No 1, p 27-31, January, 1974. 12 fig.

Descriptors: Instrumentation, Chromatography, *Gas chromatography, *Measurement, *Pesticides, *Chlorinated hydrocarbons, Organophosphorus pesticides, Carbamate pesticides, Herbicides, Water pollution, *Pollutant identification, Municipal wastes, *Potable water, Water supply.
Identifiers: Phenoxy herbicides.

The detection and analysis of pesticides in drinking water supplies are discussed. Pestides can be divided into several classes according to their chemical structure as follows: chlorinated hydrocarbon pesticides, organophosphorus pesticides, carbamates, and phenoxy herbicides. In investigating the levels and types of pesticides in water, it is important to know toxicity, extent of usage, persistence in the environment, biomagnification, and sensitivity of detection. The chlorinated insecticides are one of the most important groups. They are widely used, toxic to mammals, persistent, have a long half-life, and undergo biomagnification, ultimately being stored in the fatty tissue of the body. The gas chromatograph system consists of five parts: pressure regulator and flowmeter for the carrier gas, sample-injection system, a column, a detector, and a recorder. It is sensitive, selective, and suitable for determining pesticide levels in water. (Merritt-FIRL)

TRACE METAL CONTAMINANTS.
Dimensions/NBS, Vol 57, No 10, p 244-245, October, 1973. 2 ref.

Descriptors: *Natural resources, *Water quality standards, *Metals, *Mercury, *Toxicity, Cadmium, Lead, Heavy metals, Copper, Organic acids, *Trace elements, *Pollutant identification.
Identifiers: Nuclear magnetic resonance, Mass spectrometry, Polarography.

The determination of trace levels of toxic metals in natural waters is being investigated at the National Bureau of Standards. A study of the chemical, biological, and other mechanisms operative in natural water systems for mobilization and transport of heavy metal focuses on the transformation of inorganic mercury into highly toxic forms. Field samples of sediment and water are being analyzed for total mercury and organic mercury by nuclear magnetic resonance and mass spectrometry. In another similar project, cathode ray polarography has led to the development of improved methods for determining metals and organic substances, such as nitriloacetic acid. A stable isotope dilution procedure was developed using the spark source mass spectrograph for simultaneously determining a dozen trace elements in river water samples. Concentrations in parts per billion were determined for mercury, cadmium, lead, and copper. (Merritt-FIRL)

PITFALLS IN PARAMETER ESTIMATION FOR OXYGEN TRANSFER DATA,
Wisconsin Univ., Madison.
W. C. Boyle, P. M. Berthouex, and T. C. Rooney.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 100, No EE2, p 391-408, April, 1974. 10 fig, 4 tab, 8 ref.

Descriptors: *Model studies, *Estimates, *Aeration, Analytical techniques, Numerical analysis, Oxygen, Dissolved oxygen.
Identifiers: *Oxygen transfer data.

Some of the pitfalls of methods of parameter estimation application to the analysis of oxygen transfer data are examined. The following must be considered: know the error structure of the data and apply appropriate weighting procedures in the analysis of the data; corroborate the value of the dissolved oxygen saturation concentration employed to estimate the overall oxygen transfer coefficient (K) through experimental data for a given physical arrangement of aeration and basin geometry. Truncation of an aeration test before reaching saturation can produce substantial error in estimates of K unless a precise estimate of the dissolved oxygen concentration (C) can be determined. Truncation of dissolved oxygen data up to 20% will not effect the precision of the estimate of K. The product of KC tends to compensate for erros in K and C and will normally give reasonable estimates of the oxygen transfer rate. Poor estimates of C will tend to produce substantial error in the calculation of oxygen transfer rates. (Merritt-FIRL)

DETECTION OF TRACE METALS IN WATER,
J. D. Kerber.
Industrial Water Engineering, p 19-21, September-October 1973. 3 fig, 2 tab.

Descriptors: *Trace elements, *Water analysis, *Spectrophotometry, *Analytical techniques, Separation techniques, Water sampling, Costs, Metals, *Pollutant identification.
Identifiers: *Atomic absorption spectroscopy.

Atomic absorption, the generally preferred method for the analysis of trace metallic pollutants is reviewed. It is a quantitative rather than qualitative technique for the determination of elements in analytical samples, and in general, the samples must be in solution or suspension. In atomic absorption, the sample is heated to a high temperature to convert the molecules to individual atoms which float freely in the sample area. In this condition, they can absorb ultraviolet or visible radiation. To determine the concentration of an element in the sample, the analyst passes light from a hollow cathode lamp containing that element. A certain portion of the light is absorbed by the flame heating the sample and the spectrophotometer reads out the results. Although atomic absorption is relatively free from interferences, there are detection limits. For certain elements, auxiliary sampling techniques must be employed to concentrate the element of interest and thereby bring its levels within the detection limit or to improve the detection limit capabilities of atomic absorption. The cost of equipment ranges from $4,000 to over $13,000. (Jernigan-Vanderbilt)

CHEMICAL SURVEY OF WATERS ADJACENT TO COLONELS ISLAND, GLYNN COUNTY, GEORGIA,
Skidaway Inst. of Oceanography, Savannah, Ga.
W. M. Dunstan, and R. R. Stickney.

Georgia University Marine Science Center Technical Report Series No 74-1, March 1974. 12 p, 1 fig, 4 tab, 5 ref.

Descriptors: *Water quality, *Estuaries, *Georgia, Mixing, Dissolved oxygen, Salinity, Water temperature, Water chemistry, Hydrogen ion concentration, Nitrates, Phosphates, Mixing.
Identifiers: *Brunswick River(Ga).

Basic measurements of the water quality of the Brunswick River adjacent to Colonels Island, Georgia were made over a tidal cycle. The reported values for temperature, salinity, dissolved oxygen, pH, ammonia, chlorophyll a, nitrate and phosphate while limited to one season are within the range of values which might be expected for such an estuarine-river system. All the parameters measured indicate that the estuarine area is well mixed. (Knapp-USGS)

APPLICATION OF REAL-TIME MASS SPECTROMETRIC TECHNIQUES TO ENVIRONMENTAL ORGANIC GEOCHEMISTRY. II. ORGANIC MATTER IN SAN FRANCISCO BAY AREA WATER,
California Univ., Berkeley. Space Sciences Lab.
B. R. Simoneit, D. H. Smith, G. Eglinton, and A. L. Burlingame.
Archives of Environmental Contamination and Toxicology, Vol 1, No 3, p 193-208, 1973. 5 fig, 1 tab, 24 ref.

Descriptors: *Pollutant identification, *California, Rivers, *Bays, Solvents, Solubility, Sampling, Water sampling, *Organic matter, *Oil wastes, Gas chromatography, Mass spectrometry.
Identifiers: *San Francisco Bay, San Pablo Bay, Carquinez Strait, Sacramento River, San Joaquin River.

The solvent soluble (organic) matter passing through a fine fitted filter was investigated in samples of water taken from the San Francisco and San Pablo bays, the Carquinez Strait, and an estuary in the confluence of the Sacramento and San Joaquin rivers. The petroleum ether extracts (ranging) from 2.5 to 102 microgram/liter) were analyzed using gas chromatography, computer coupled gas chromatography/mass spectrometry, and high resolution mass spectrometry. The organic compounds identified in these extracts are quite diverse and consist mainly of hydrocarbons from various sources. Some phthalate esters occur at various sampling sites. It is concluded that the techniques of gas chromatography/mass spectrometry, and high resolution mass spectrometry are ideally suited to the assessment of some of the potential interactions of pollutants and other organic compounds in the aquatic environment. (Merritt-FIRL)

MERCURY IN HUMAN HAIR, A STUDY OF THE RESIDENTS OF LOS ALAMOS, NM, AND PASADENA, CALIF., BY COLD VAPOR ATOMIC ABSORPTION SPECROPHOTOMETRY,
Cincinnati Univ., Ohio. Coll. of Medicine.
P. J. Nord, M. P. Kadaba, and J. R. J. Sorenson.
Archives of Environmental Health, Vol 27, No 1, p 40-44, July 1973. 2 fig, 2 tab, 12 ref.

Descriptors: *Mercury, Human physiology, *Analytical techniques, Toxicity, Contaminants, Public health, Testing procedures, Laboratory tests, Spectroscopy, Distribution, *California, *New Mexico, *Pollutant identification.
Identifiers: *Human hair, Atomic absorption spectroscopy.

Rapid digestion and quantitative mercury recovery are obtained when hair is digested in a mixture of nitric acid, sulfuric acid, and potassium permanganate. The studies were done on replicate samples drawn from a large homogeneous air sample used as a standard reference. The method was applied to hair samples from 80 men and 147 women, long-term residents of Los Alamos, NM, and 99 women, long-term residents of Pasadena, Calif. The geometric mean of the mercury concentration found in the hair samples was: Los Alamos, 18.0 micro g/gm (men) and 18.9 micro g/gm (women); Pasadena, 25.0 micro g/gm. Values ranged from 5 micro g/gm to over 100 micro g/gm. The mean values found are higher than previously reported. The results suggest that there may be differences in the environmental exposure of the two populations to mercury. (Jernigan-Vanderbilt)

INTERFERENCES IN THE DETERMINATION OF METALLIC ELEMENTS IN HUMAN HAIR, AN EVALUATION OF ZINC, COPPER, LEAD AND CADMIUM USING ATOMIC ABSORPTION SPECTROPHOTOMETRY,
Cincinnati Univ., Ohio. Coll. of Medicine.
J. R. J. Sorenson, E. G. Melby, P. J. Nord, and H. G. Petering.
Archives of Environmental Health, Vol 27, No 1, p 36-39, July 1973. 3 tab, 11 ref.

Descriptors: *Heavy metals, Laboratory tests, *Analytical techniques, Human physiology, *Zinc, *Copper, *Lead, *Cadmium, Toxicity, Spectroscopy, Testing procedures, Contaminants, Public health, Pollutant identification.
Identifiers: *Human hair, *Atomic absorption spectroscopy.

Hair, a metabolic end product, has been used to indicate health status. The purposes in this study were: (1) to evaluate the hair digest matrix as a source of interferences in the determination of metals using atomic absorption spectrophotometry, and (2) to develop a technique whereby meaningful interlaboratory comparison of analytical data can be made. For hair analysis, interferences due to broad-band nonspecific molecular absorption, chemical ionization, flame emission, flame scatter, light scatter, and matrix matching can be avoided using ordinary methods and commercially available equipment. A technique is presented for the preparation of a standard reference hair sample. This standard reference hair was then used to demonstrate that concentrations of copper, zinc, lead and cadmium in a nitric acid hair digest matrix can be measured with precision and accuracy. (Jernigan-Vanderbilt)

AQUA REGIA FOR QUANTITATIVE RECOVERY OF MERCURIC SULFIDE FROM SEDIMENTS,
Michigan State Univ., East Lansing. Dept. of Crop and Soil Sciences.
L. W. Jacobs, and D. R. Keeney.
Environmental Science and Technology, Vol 8, No 3, p 267-268, March 1974. 1 tab, 6 ref.

Descriptors: *Mercury, *Sediments, *Water pollution sources, *Analytical techniques, Separation techniques, Chemical analysis, Organic compounds, Inorganic compounds, Digestion.
Identifiers: *Mercuric sulfide, *Aqua Regia, Quantitative recovery.

A digestion procedure consisting of a 2:1 concentration of sulfuric:nitric acids plus potassium permanganate and persulfate oxidation proved to be inadequate for quantitative recovery of HgS, a Hg compound that may be present in reduced materials such as river and lake sediments and waste sludges. Since HgS or Hg(II) associated with metal sulfide phases may be a significant fraction of the total Hg in these substances, incomplete dissolution of these Hg(II) sulfide phases during sample digestion will cause total Hg concentrations to be underestimated. An aqua regia digestion procedure which quantitatively recovers HgS

from sediments is described, and is recommended for total Hg analyses of sediments. Potassium permanganate and persulfate must be included with aqua regia to obtain complete recovery of five other Hg compounds implicated in Hg transformations and pollution in the environment. Nonaqua regia procedures being used to analyze sediments or sludges for total Hg should be tested for quantitative recovery of HgS. (Jernigan-Vanderbilt)

A NEW VANADYL (IV) THIOCYANATE METHOD FOR THE SPECTROPHOTOMETRIC DETERMINATION OF VANADIUM (IV),
Andhra Univ., Waltair (India). Dept. of Chemistry.
U. Muralikrishna, and K. V. Bapanaiah.
Current Science, Vol 42, No 13, p 460-461, July 5, 1973. 3 ref.

Descriptors: *Spectrophotometry, *Analytical techniques, Chemical analysis, Water quality, Heavy metals, Color reactions, *Trace elements, *Pollutant identification.
Identifiers: *Vanadium.

The extraction behavior of vanadyl thiocyanate complex with 8:3 n-butanol and ethyl acetate was studied. This method has the advantage of (1) 2-20 mg of vanadium can be estimated rapidly, and (2) tolerance to interference by common anions and larger reagent concentrations (50 to 100 fold). The extraction is quantitative and rapid (equilibium time is less than 30 sec) within the pH range of 0.5 to 2.5. Maximum absorption is at 730 nm wavelength. Interference with the method is caused by Fe(III), Mo(VI), Ni(II) and Cu(II). (Jernigan-Vanderbilt)

HEAVY ELEMENTS IN SURFACE MATERIALS: DETERMINATION BY ALPHA PARTICLE SCATTERING,
Chicago Univ., Ill. Enrico Fermi Inst.
T. E. Economou, W. A. Anderson, E. M. Blume, and A. L. Turkevich.
Science, Vol 181, p 156-158, July 1973. 2 fig, 1 tab, 6 ref.

Descriptors: *Heavy metals, *Lead, *Paints, *Toxicity, *Analytical techniques, Instrumentation, *Pollutant identification.
Identifiers: Surface materials, Alpha particle scattering.

The backscattering of alpha particles from a radioactive source can be used to determine the amounts of heavy elements such as lead in surface materials. A light, portable instrument has been constructed that can be used as a survey meter for painted surfaces. It was intended for use as a survey meter for lead detection by a semiskilled person. It can detect lead content of less than 0.3% in a surface paint in a measurement lasting a few minutes. One limiting characteristic of this instrument is that it provides information only about the top layer of the surface or just a few micrometers deep even if many layers of paint have been applied. The main components of the instrument are: (1) a source of alpha radioactivity that emits relatively monochromatic alpha particles and a negligible amount of harmful penetrating radiation such as gamma or x-rays; (2) a detector of the silicon surface-barrier type to register the number of backscattered alpha particles and their energy; (3) electronics consisting of a charge-sensitive preamplifier and amplifier for the signal from the detector, and a discriminator eliminating the signals from the alpha particles with low energies; and (4) a read-out system and timer. Values obtained compare favorably with those from conventional analysis. (Jernigan-Vanderbilt)

ISOLATION OF (BETA SUB 2)-MICROGLOBULIN FROM THE URINE OF PATIENTS WITH ITAI-ITAI (OUCH-OUCH) DISEASE,
National Inst. of Industrial Health, Kawasaki (Japan). Dept. of Occupational Diseases.
M. Ohsawa, and M. Kimura.
Experientia, Vol 29, No 5, p 556-558, 1973. 3 fig, 1 tab, 16 ref.

Descriptors: *Cadmium, *Proteins, *Human pathology, *Electrophoresis, *Urine, Laboratory tests, Analytical techniques, Testing procedures, Industrial wastes, Heavy metals, Pollutant identification, *Isolation.
Identifiers: *Proteinuria, Microglobulin.

This study shows that (Beta sub 2)-microglobulin can be isolated from the urine of patients with Itai-itai disease and that it is one of the main components in the proteinuria associated with this disease. In the experiment, 24 hour urine specimens were collected from female patients with Itai-itai disease. Urinary protein was determined by the biuret method according to Piscator's procedure. Urinary protein varied between 0.7 to 1.4 g per 24 h. Great quantities of Beta sub 2-microglobulin is excreted in the urine of patients with Itai-itai disease. Two distinguishable retinolbinding proteins giving the same mobility on disc electrophoresis as that of band 3, were also isolated preliminarily from the same urine. It was concluded from the findings on urinary low molecular weight proteins that proteinurea of Itai-itai disease is similar to the tubular one of chronic cadmium poisoning, but further work on urinary levels
this disease is required to explain the significance of this similarity. (Jernigan-Vanderbilt)

SIGNIFICANCE OF LEAD ISOTOPE COMPOSITION IN BLOOD,
Texas Univ., Dallas, Inst. for Geological Sciences.
W. I. Manton.
Nature, Vol 244, No 5412, p 165-167, July 1973. 5 fig, 1 tab, 9 ref.

Descriptors: *Lead, *Isotope studies, *Human pathology, Stable isotopes, Analytical techniques, Testing procedures, Mass spectrometry, Air pollution, *Texas, Distribution, *Pollutant identification.
Identifiers: *Blood, *Dallas(Tex).

Since blood sampling is the easiest means of conducting a large scale investigation of lead in the human body, the feasibility of such a program is studied. Measurements were made of the ratios of lead isotopes in the blood of residents, in particulate airborne lead and in emissions from two smelters in residential districts in southern Dallas. Tests indicated that lead in the blood ontinuously mixes with a large reservoir of lead elsewhere in the body, presumably the skeleton. Since it can be demonstrated that long response times are consistent with available data regarding the daily uptake and body burden of lead, it appears that the same number of atoms of lead as enter the blood each day, are removed in the urine, maintaining the total number of atoms of lead in the body constant. Isotope tracer studies to measure the uptake of lead from pollutants are best attempted on children, because, as a child grows and his bones calcify, lead moves from his blood into his skeleton. The isotope ratios of lead in his blood will therefore be fairly representive of the lead to which he has been exposed, irrespective of any exchange of isotopes with the skeleton. (Jernigan-Vanderbilt)

MERCURY IN WATER: AN EVALUATION OF LABORATORIES AND METHODOLOGY,
California State Dept. of Public Health, Berkeley. Sanitation and Radiation Lab.
A. E. Greenberg, J. Thomas, and B. R. Tamplin.
Journal of the American Water Works Association, Vol 65, No 8, p 552-554, August 1973. 1 tab, 8 ref.

Descriptors: *Analytical techniques, *Spectroscopy, *Mercury, *Public health, Laboratory tests, Water quality, California, Colorimetry, Potable water, Water analysis, Pollutant identification.
Identifiers: *Inter-laboratory comparisons, Atomic absorption spectroscopy, Accuracy.

Each of seven labs received a set of fourteen randomly coded water samples with specific amounts of mercury. These samples consisted of four natural waters from community samples, one doubly-distilled blank, three samples containing 4 micrograms/l, and two samples containing 6 micrograms/l. Three labs used the flameless atomic absorption technique (one also used crystal violet colorimetric technique), two others used colorimetric technique (crystal violet, and dithizone), one used a wide-band Hg analyzer and the last used a dithizone field kit. Results from the lab which used the field-test-kit dithizone method were unacceptably high, bore no relationships to the results of the other laboratories and were therefore excluded from further consideration. Resports of the other labs were relatively consistent. The best results, in terms of accuracy and precision, were obtained with flameless atomic-absorption. The results attained with the crystal violet procedure were acceptable but less precise and accurate than atomic-absorption, and the dithizone method was still less satisfactory. (Jernigan-Vanderbilt)

QUANTITATIVE SEPARATION OF MAGNESIUM AND PALLADIUM FROM NUMEROUS METAL IONS ON TITANIUM TUNGSTATE PAPERS BY ELECTROCHROMATOGRAPHY,
Aligarh Muslim Univ. (India). Dept. of Chemistry.
M. Qureshi, K. G. Varshney, and F. Khan.
Separation Science, Vol 6, No 4, p 559-572, August 1971. 8 tab, 12 ref.

Descriptors: *Chromatography, *Separation techniques, *Electrolytes, *Cations, Metals, *Electrochemistry, Analytical techniques, Spectrophotometry, Ions, Ion exchange, Chemical reactions, Laboratory tests, *Magnesium, *Pollutant identification.
Identifiers: *Palladium.

Electrochromatography was performed on 46 metal ions in 15 electrolytes on papers impregnated with titanium tungstate by applying different electrical potentials and allowing different time intervals for migration. On the basis of the differential mobility of the cations, which depend on the nature of the complexes formed with the background electrolytes and the ion exchange properties of titanium tungstate, a large number of binary and ternary separations were achieved. The separations of one metal ion from numerous metal ions were also accomplished. In removal of magnesium from titanium tungstate papers 5% NCl proved to be the ideal eluting solvent. Elution of palladium was possible from wet paper with 40 ml of 10% HCl. Cleaner and faster separation of metal ions tested depended on the ion exchange paper and on the background electrolyte. (Jerome-Vanderbilt)

STUDIES OF SOLVENT EXTRACTION BEHAVIOR OF SOME DIVALENT METALS WITH LIQUID ION-EXCHANGER,
Palli Siksha Sadana, Sriniketan (India). Dept. of Chemistry.
A. K. De, and U. S. Ray.
Separation Science, Vol 6, No 3, p 443-450, June 1971. 2 fig, 2 tab, 3 ref.

Descriptors: *Solvent extractions, *Heavy metals, *Ions, *Ion exchange, Analytical techniques, Separation techniques, Testing procedures, Laboratory tests, Acids, Measurement, *Pollutant identification.
Identifiers: Divalent metals.

A systematic study of the comparative extraction behavior of aqueous solutions of some divalent metals was carried out with a high molecular weight carboxylic acid, SRS-100, with benzene used as a diluent. The study includes the extraction behavior as a function of pH, effect of diluent, metal ion concentration, solvent concentration, and interference of the associated elements. In almost all cases nearly quantitative extraction was achieved. The proposed method is simple, rapid, and applicable both at micro and macro levels. The method is applicable to extraction of metal ions in the presence of other commonly interfering ions at milligram levels. Metals examined include Fe, Zn, Cd, Hg, Pb, Pd, Mg, Ca, Sr, and Ba. (Jerome-Vanderbilt)

THE FLUOROMETRIC DETERMINATION OF SELENIUM: A LITERATURE REVIEW.
Fluorometry Reviews, G. K. Turner Associates, Palo Alto, California, September, 1972. 4 p, 25 ref.

Descriptors: *Fluorometry, *Trace elements, *Testing procedures, Toxicity, Laboratory tests, *Reviews, Organic matter.
Identifiers: *Selenium.

Since selenium is one of the essential trace elements, it is important to be able to measure very low concentrations of selenium in animal tissues, in soils, and especially in feeds - to determine that the necessary amount is present without reaching toxic levels. Large amounts of selenium can be assayed by gravimetric determinations, titrations, and colorimetric methods. In 1960 Cousins reported a fluorometric method for measuring selenium yielding increased sensitivity. A typical fluorometric procedure is presented in detail. Selenium in the form of selenite reacts with aromatic ortho-diamines to form piazselenols which fluoresce in certain organic solvents. With biological specimens, the sample must first be ashed under strong oxidizing conditions. The inorganic selenium is isolated and converted to the IV oxidation state. It is then reacted with the ortho-diamine and the piazselenol is extracted into a suitable organic solvent for measurement. Modifications depending on the type of sample which are discussed include digestion methods (wet or combustion with oxygen), removal of interfering substances either by separation of selenium or masking the interference, and choice of reagent for the production of fluorescence. Filters for use in the fluorometer for measurement are mentioned. (Jernigan-Vanderbilt)

5B. Sources Of Pollution

BIOLOGICAL DEGRADATION OF HYDROCARBONS IN WATER,
Rhode Island Univ., Kingston. Dept. of Microbiology.
C. W. Houston.
Available from the National Technical Information Service as PB-233 438, $3.25 in paper copy, $1.45 in microfiche. Completion Report, (1974). 31 p, 14 fig, 2 tab, 6 ref. OWRR B-033-RI(1). 14-31-0001-3640.

Descriptors: *Organic compounds, Pseudomonas, *Growth rates, *Mass transfer, *Biodegradation, Pollution, Kinetics, Mathematical models.
Identifiers: *Heptane, *Pseudomonas aeruginoss.

The growth of Pseudomonas aeruginoss on n-heptane was found to be exponential only at low cell concentrations (1 gm/l). The change from exponential to linear growth rate occurs when dissolved oxygen is well above the critical value. The data fit the mathematical model for homogeneous kinetics developed by Dunn in 1958. They suggest that heptane is used in dissolved form rather than by direct contact between microorganism and hydrocarbon droplet. A decrease in interfacial tension during growth is attributed to the production of a surface tension depressant by the organism. Increased solubility of the hydrocarbon as a result of its production may account for the high growth rate observed on this substrate of low solubility.

ECOLOGICAL INVESTIGATION OF EUBACTERIA AND ACTINOMYCETES IN AQUATIC AND TERRESTRIAL BIOTOPES OF CROATIA (IN SERBO-CROATIAN),
Institut za Botaniku, Zagreb (Yugoslavia).
Z. Pavletic, and B. Stilinovic.
Acta Biol Iugosl Ser B Mikrobiol, Vol 8, No 1, p 77-84, 1971, English summary.
Identifiers: *Actinomycetes, Adriatic coast, Bacteria, *Biotopes, Ecological studies, *Eubacteria, Fungi, Rivers, Sea, Soils, Springs, Streptomyces-fradiae, *Yugoslavia(Croatia), *Heterotrophic bacteria.

A review of research on the ecology of bacteria in Croatia is given. Rivers, hot springs, the sea and soils were investigated. The rivers of the continental Korana (including Plitivice lakes), Mreznica and Sava regions and the entire course of the river Mirna in Istria were examined for total numbers of heterotrophic bacteria and most probable number of coliforms. In the Tuhelj hot springs, actinomycetes from thermal mud had very high antimicrobial activity due to a race of Actinomyces (Streptomyces) fradiae. The bacteria in seawater determined at about 20 points in the bay of Rijeka, between the cities of Selce and Plomin were examined and the occurrence of a number of heterotrophic bacteria and coliforms was noted both along the coast and in open sea in winter. Detailed research on actinomycetes in continental and littoral soils of Medjimurje in N. Croatia, Medvednica Mountain, the region around Zagreb, the eastern region of Slavonia, the southern region of Gorski Kotar, Istria, the Croatian Adriatic coast, the littoral region of Dalmatia and the islands of Krk, Rab, Pag, Dugi, Kornati, Prvic, Kolocep and Lopud was conducted. Actinomycetes in specific types of soils and their relationship to other bacteria and fungi, and antagonistic races of actinomycetes and their relationship to soil type and vegetation were studied.--Copyright 1974, Biological Abstracts, Inc.

EFFECTS OF SALINITY AND SUSPENDED SEDIMENT ON TURBULENT DIFFUSION OF POLLUTANT IN PUERTO RICO,
Puerto Rico Univ., Mayaguez. Dept. of Civil Engineering.
C. Y. Kuo.
Available from the National Technical Information Service as PB-233 365, $3.25 in paper copy, $1.45 in microfiche. Completion Report UPRICO-WRRI-PR-73-74, Puerto Rico Water Resources Research Institute, Mayaguez, December 1973. 29 p, 13 fig, 7 tab, 3 ref. OWRR A-034-PR(1).

Descriptors: Streams, Estuaries, Bays, Pollutants, Municipal wastes, Industrial wastes, *Sediments, Suspension, *Salinity, *Turbulence, *Diffusion, Water pollution control, *Puerto Rico, Diffusivity, *Path of pollutants, Sugarcane, Turbulent flow, Dispersion.
Identifiers: Sugarcane wastes.

Due to the spatial variation of salinity in estuaries and coastal waters, a study was made in the laboratory of the molecular and the turbulent diffusion process in fluid media with various salinity. Dye diffusions were performed in salt water of known concentrations to simulate the dispersion of pollutant in tidal waters. Both the turbulent and the molecular diffusion coefficient increase as the salinity increases. The variation of the turbulent diffusion coefficient is approximately linear with respect to the salinity. However, the molecular diffusion coefficient tends to charge non-linearly with the salinity. The turbulent diffusion rate is rather uniform with comparison to the molecular diffusion rate.

HYDROGEOLOGY OF THE FORMATION AND NEUTRALIZATION OF ACID WATERS DRAINING FROM UNDERGROUND COAL MINES OF WESTERN MARYLAND,
Geological Survey, Parkville, Md.
E. F. Hollyday, and S. W. McKenzie.
Maryland Geological Survey Report of Investigations No 20, 1973. 50 p, 16 fig, 8 tab, 71 ref.

Descriptors: *Acid mine water, *Hydrogeology, *Neutralization, *Maryland, Coal mines, Mine acids, Path of pollutants, Water quality, Water chemistry, Water pollution control, *Mine drainage.

The flows from 18 underground mines for which mine maps are available in the bituminous coal basins of western Maryland were measured, and water samples were collected for determination of 27 major dissolved constituents and chemical properties and 28 minor elements. Natural neutralization is taking place in the underground environment and the most nearly neutralized acid mine drainage is associated with flow from an upper mine to a lower mine through the intervening rock strata. Engineering Geology, Vol 7, No 3, p 219-229, December 1973. 3 tab, 28 ref.

Descriptors: *Landfills, *Garbage dumps, *Leaching, Water pollution effects, *Path of pollutants, Water pollution control, Hydrogeology, Aquifer characteristics, Water quality, Water chemistry.

The decomposition of solid waste materials in sanitary landfills produces liquids and gases which are deleterious to human beings, animals, plants and inorganic geologic materials. Leachate characteristics and the effect of leachate on groundwater quality and carbonate strata are discussed. A system for site evaluation for purposes of sanitary landfill is presented. The characteristics of the soil and rock at a site are included in the evaluation system through assessment of their infiltration potential, permeability, filtering capability and ab-

sorption potential. The characteristics of the groundwater at a site are taken into consideration through assessment of the substrate potential, buffering capacity and distributive potential for contaminants. Formulae are given which allow determination of evaluation parameters, and an example of the application of the rating system is presented. Use of the site-evaluation system will improve the quality of site selection and will reduce contamination and pollution problems created by construction of refuse landfills at unsuitable locations. WATER QUALITY PORTION OF THE COOPER RIVER ENVIRONMENTAL STUDY.
Environmental Protection Agency, Athens, Ga. Surveillance and Analysis Div.
In: Cooper River Environmental Study. South Carolina Water Resources State Water Plan Report, No 117, p 64-103L, April 1974. 8 fig, 12 tab, 6 ref.

Descriptors: *Estuaries, *South Carolina, *Saline water intrusion, *Flow control, Path of pollutants, Stratified flow, Streamflow, Discharge(Water).
Identifiers: *Cooper River(SC), *Charleston Harbor(SC).

A multi-agency study of the Cooper River, South Carolina includes physical, chemical, and biological investigations both before and during a controlled, reduced flow period. By comparing the October study data (representing a high flow condition) to the November study data (representing a controlled reduced flow condition), some of the effects of proposed rediversion can be demonstrated. Daily flow to the Cooper River from Lake Moultrie averaged 20,550 cfs during the October study and 3,000 cfs during the November study period. Water temperature averaged 21.5 deg C during the October study and 17.9 deg C during the November study. Dissolved oxygen concentrations ranged from 3.4 mg/liter at mile 16.5 to 8.4 mg/liter at mile 44.2 during October and 5.0 mg/liter at mile 44.2 during the November study. Average dissolved oxygen concentrations were not significantly different between the October and November study periods. During October, percent saturation values for dissolved oxygen ranged from 70.7 to 88.1 and 71.8 to 92.6 percent for high and low slack tide, respectively (surface and bottom samples averaged). Percent saturation values for dissolved oxygen at reduced river flow (November) ranged from 69.7 to 89.7 percent and 71.6 to 90.8 percent for high and low slack tide, respectively. THE EFFECT OF PROPOSED DEEPENING OF THE JOHN F. BALDWIN AND STOCKTON SHIP CHANNELS ON SALT-WATER INTRUSION, SUISUN BAY AND SACRAMENTO-SAN JOAQUIN DELTA AREAS, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
J. P. Akers.
Water-Resources Investigations 56-73, March 1974. 10 p, 2 fig, 1 tab, 2 ref.

Descriptors: *Saline water intrusion, *Dredging, *California, *Surface-groundwater relationships, Channel improvement, Bays, Navigation.
Identifiers: *Suisun Bay(Calif), Sacramento-San Joaquin Delta(Calif).

The natural channel adjacent to the reach of the John F. Baldwin and Stockton ship channels between the Benicia-Martinez bridge and False River, California has been deeper than the authorized 36-ft depth. A considerable part of the reach has been deeper than the 47-ft depth authorized for the ship channel in Suisun Bay. Thus, most of the permeable strata that immediately underlie the alinement of the proposed improved channel probably already are saturated with saltwater and the proposed channel deepening will not change their present water-quality regimen. KINETICS OF SUBSTRATE ASSIMILATION AND PRODUCT FORMATION IN ANAEROBIC DIGESTION,
Institute of Gas Technology, Chicago, Ill. Div. of Bioengineering Research.
S. Ghosh, and F. G. Pohland.
Journal Water Pollution Control Federation, Vol 46, No 4, p 748-759, April 1974. 10 fig, 2 tab, 16 ref.

Descriptors: *Anaerobic digestion, *Kinetics, *Biodegradation, *Mathematical models, *Waste water treatment, *Model studies, Microorganisms, Anaerobic bacteria, Digestion, Wastes, Methane, Acids, Bacteria, Chemical reactions, Sludge digestion, Organic loading, Carbohydrates, Organic compounds, Gases, Fermentation.
Identifiers: Acetic acid, Volatile acids, Butyric acid, Propionic acid, Glucose.

Several kinetic process models are capable of describing the concentrations and production velocities of the various acidic products and gases from an anaerobic digester. Analytical techniques for determining the appropriate kinetic constants of such mathematical models are presented. A number of growth kinetic constants applicable to dominant cultures of acid and methane formers were determined from experimental data. Comparison of the generation times of 4.8 and 0.56 hr for the methane and acid formers, respectively, confirmed the common assumption that methane formation was the rate-limiting step in anaerobic digestion of soluble wastes. Acid fermentation of glucose substrate showed that the yield of acetic acid from glucose was the highest, followed by propionic and butyric acids. (Witt-IPC)

AEROBIC BIODEGRADATION OF CARBOXYMETHYLCELLULOSE,
Hercules Research Center, Wilmington, Del.
M. G. Wirick.
Journal Water Pollution Control Federation, Vol 46, No 3, p 512-521, March 1974. 2 fig, 6 tab, 21 ref.

Descriptors: *Chemical wastes, *Cellulose, *Biodegradation, Aerobic conditions, Organic compounds, *Industrial wastes, Degradation, Ethers, Analytical techniques, Environmental effects, Bacteria, Carbohydrates, Chemical industry, Pulp and paper industry, Additives, Colloids.
Identifiers: *Carboxymethylcellulose, Cellulose ethers, Cellulose derivatives, Thickeners(Viscosity regulators).

Carboxymethylcellulose (CMC) is a versatile hydrophilic colloid possessing considerable thickening power. Its annual U.S. production of approximately 65 million pounds is used in many fields, including adhesives, coatings, cosmetics, detergents, foods, paper, petroleum, pharmaceuticals, and textiles. Because it is completely water-soluble in nearly all of its applications, it eventually finds its way into waste streams, and ultimately into surface water. Although it is nontoxic and is permitted in potable water in concentrations up to 1 mg/liter, predictions concerning its long-range effect on the environment require knowledge of its biodegradability. Thus, two purified CMC samples, CMC-4 and CMC-7 (degrees of substitution 0.41 and 0.71, resp.) were exposed to the action of waste water bacteria in a static air-saturated culture medium. After a week, residual substrate concentrations were determined by two analytical procedures, one specific for the substituent groups and the other sensitive to the carbohydrate portion of molecular chains. Adaptive transfers were then made to fresh solutions, and the process repeated until the percentage degradation stabilized. The rate of biochemical oxidation of CMC-4 maximized at about 80% in 1 week, whereas acclimation of CMC-7 was not complete until the end of the 16th week, when a biodegradation rate of about 60%/week was reached. Microbial attack was more rapid for unsubstituted than for substituted anhydroglucose units. (Witt-IPC)

WASTE WATER LOADS AND THEIR POSSIBLE REDUCTIONS IN THE FINNISH FOREST INDUSTRY (SUOMEN METSAETEOLLISUUDEN JAETIEVESIKUORMITUS JA SEN KEHITYSNAEKMAT),
Finnish National Water Board, Helsinki.
H. Nilsen.
Paperi ja Puu (Papper och Tra), Vol 55, No 11, p 845-848, 851-852, Nov, 1973. 12 tab.

Descriptors: *Water consumption, *Pulp and paper industry, *Pulp wastes, *Water pollution sources, Europe, *Organic loading, Suspended solids, Biochemical oxygen demand, Discharge(Water), Waste water(Pollution).

Identifiers: *Finland, Forest products industries, Pulp mills, Paper mills, Board(Paperboard), Mills, Fiberboard(Building board) mills, Kraft mills.

In 1972 the Finnish forest products industries produced 6,283,000 t of pulp., 4,695,000 t of paper and paperboard, and 260,000 t of fiber insulation boards. Locations of various mills are discussed in relation to their water consumptions and the characteristics of discharged polluted waste waters. Pollution loads caused by different manufacturing processes are compared. The total waste water load discharged in 1972 was 1328 t of BOD and 822 t of suspended solids per 24 hr. Depending on the process and products, these figures varied from 10 to 169 kg of BOD and 16 to 131 kg of suspended solids per ton of product, while specific water consumptions varied from 45 to 579 cu m per ton. Compared to overall Eurpean industry figures, on the average, Finland used more water, lost more solids in pulp production, and discharged greater BOD loads in kraft pulp manufacture. Current methods for reducing effluent loadings are reviewed. The National Water Board of Finland has set of 1980 taget for 50% BOD reduction and 80% solids load reduction, compared to 1970 data. (Brown-IPC)

PATHOGENIC ORGANISMS IN THE MURDERKILL RIVER ESTUARY,
Delaware Univ., Newark. Dept. of Biological Sciences.
E. De Michele.
Journal Water Pollution Control Federation, Vol 46, No 4, p 772-776, April, 1974. 4 fig, 1 tab, 6 ref.

Descriptors: *Pathogenic bacteria, *Aquatic microorganisms, *Waste water treatment, Rivers, *Water pollution, *Delaware, Coliforms, Streptococcus, Water pollution sources, Microorganisms, Water quality, Wastes, Animal wastes, Bacteria, Aquatic microbiology, Discharge(Water), Flow rates, Farm wastes, Freshwater, Water types, Treatment facilities.
Identifiers: *Murderkill River estuary(Del), Kent County(Del).

The Murderkill River is a partial tidal body of water located in Kent County, Delaware, with summer monthly mean freshwater discharges ranging from 17 to 29 cu ft/sec (28.9 to 49.3 cu m/min) at a point coincident with the effluent discharge from the Kent County Regional Wastewater Treatment Plant. Indicator bacterial concentrations were determined over 6 summers to characterize river conditions before startup of the 10 million gal/day (37,850 cu m/day) plant. Of all fecal coliform (FC) concentrations, 45% were greater than 200/100 ml, while 90% of all fecal streptococcus (FS) values exceeded 200/100 ml. The FC:FS ratio always was less than 4.0, with 90% of all values less than 0.7, indicating that the principal sources of pollution probably are animal wastes. (Witt-IPC)
W74-09466

CHLORIDE AND LEAD IN URBAN SNOW,
Department of the Environment, Ottawa (Ontario). Water Quality Div.
B. G. Oliver, J. B. Milne, and N. LaBarre.
Journal Water Pollution Control Federation, Vol 46, No 4, p 766-771, April, 1974. 5 tab, 24 ref.

Descriptors: *Sodium chloride, *Chlorides, *Lead, *Snow, *Urban runoff, Rivers, *Water pollution sources, Water quality, Water pollution, Snowmelt, Gasoline, Water pollution sources, Pollutants, Sodium chloride, Salts, *Canada, Runoff, Deicers, Snow removal.
Identifiers: Leaded gasoline, Ottawa(Ontario).

The chloride and lead concentrations of snow and runoff in Ottawa were determined in order to assess whether snow melting and snow disposal practices were adversely affecting the water of local rivers. The use of sodium chloride for road deicing was shown to increase chloride levels substantially in area rivers. A portion of the lead associated with the burning of leaded gasolines could be traced in the rivers. A considerable reduction of lead input to the rivers could be accomplished by maintaining snow disposal sites away from watercourses and flood plains. (Witt-IPC)

STUDY OF THE DIFFUSION OF THE DEEP SEA DISPOSAL OF RESIDUAL WATER,
M. Aubert, J. Aubert, and J. P. Breittmayer.
Rev Int Oceanogr Med. 29. p 31-52, 1973. Illus. (English summary).
Identifiers: *Bacteria, *Diffusion, *France(Nice), Residual water, Sea water, Waste waters, *Outfalls, *Waste disposal, Path of pollutants.

The basic formula established by Aubert and Desirotte was verified by the construction of outlets. This formula was pessimistic but valid for the evaluation of the bacterial upper limit. The bacterial decrease may be calculated in the case of the outlet of Nice (France) which discharges 2 to 3 cube m/sec. The outlets showed the importance of the thermocline in wastewater dynamics.--Copyright 1974, Biological Abstracts, Inc.

PLATING POLLUTION: THE LATEST FROM EPA, PART 1,
Products Finishing, Vol 38, No 7, p 141-144, April, 1974. 1 tab.

Descriptors: *Standards, Water pollution sources, *Water utilization, *Industrial water, *Waste water treatment, Pollution abatement.
Identifiers: *Electroplating industry.

The stringent limitations proposed by the Environmental Protection Agency on the electroplating industry were discussed at an American Electroplaters' Society seminar. The proposals made by the EPA require that a plater discharge no more than a stated weight of any contaminant for each unit of surface area he plates. The platers must limit concentrations of contaminants in the rinse water to 1.0 mg/liter or less, depending upon the constituent (except for suspended solids). Few, if any, of the pollution control authorities in the electroplating industry believe that the combination of low water usage and low concentrations can be achieved by production plants. The basis for the proposed regulations is a Battelle Memorial Institute study which estimated that a water use of 80 liter/sq m could generally be attained. (Merritt - FIRL)

ENVIRONMENTAL HAZARDS OF NUCLEAR WASTES,
P.P. Micklin.
Science and Public Affairs, Vol 30, No 4, p 36-42, April, 1974. 1 fig, 29 ref.

Descriptors: *Management, *Nuclear wastes, *Radioactive waste disposal, Radioactive wastes, Waste storage, Liquid wastes, Storage tanks, Underground storage, Dead storage, Geological formations.

The management and storage of nuclear wastes are discussed. Krypton-85, cesium-137, and strontium-90 present the greatest management problems because of their long physical half-lives. Because of their highly radioactive content, reactor wastes must be isolated from the biosphere for centuries or longer. The greatest quantity of high level wastes, approximately 85 million gallons, is contained at three federal repositories. Although not presently posing a serious storage problem, these high level radioactive wastes are expected to reach 93 million gallons by the year 2000. Commercial wastes are a more serious problem because they can attain heat and radioactivity levels six times greater per unit of volume. Tank storage has been satisfactory so far, but salt formations are preferred for permanent disposal of commercial high level radioactive wastes since they are dry and impervious to water. Other possible modes of earth disposal include burial deep within other geologic formations, on the seabed and within continental ice sheets. (Merritt - FIRL)

COMPARING EFFLUENT RELEASES FROM NUCLEAR AND FOSSILFUELED POWER PLANTS,
Brookhaven National Lab., Upton, N.Y. Health Physics and Safety Div.
A. P. Hull.
Nuclear News, Vol 17, No 5, p 51-55, April, 1974. 12 fig, 2 tab, 21 ref.

Descriptors: *Air pollution, *Nuclear powerplants, *Fossil fuels, Gases, Halogens, Particulates, Corrosion, Radioactive wastes, *Water pollution sources, Water pollution effects.
Identifiers: Liquid fission.

Airborne effluent releases from nuclear power plants are compared to those from fossil fueled power plants. Yearly overall average amounts of gaseous, halogen and particulate, liquid fission and corrosion products, and tritium activity from 1967 to 1972 have been calculated and are tabulated. Data for similar comparisons of conventional radioactivity and pollutants in liquid effluents are not available. However, studies to date in the vicinity of several nuclear power reactors suggest that their radioactive liquid effluents have been dosimetrically insignificant. Comparable studies of the degree of pollution of streams and groundwater by releases peculiar to fossil fueled plants have not appeared in the literature, so it also appears to be minimal. (Merritt - FIRL)
W74-09503

CORRELATION BETWEEN TURBIDITY AND IRON CONTENT OF THE FILTER EFFLUENT OF WELL ORIGIN,
Yugoslav Dept. of Water Treatment Plant Automation, Belgrade.
A. Filip, and B. Vuskovic.
Journal American Water Works Association, Vol 66, No 3, p 166-168, March, 1974. 5 fig, 2 ref.

Descriptors: *Wells, Groundwater, *Turbidity, Water quality, *Iron, *Iron compounds, *Filters.
Identifiers: Filter effluent, *Turbidimeter, Iron trace analyzer.

The investigation had a twofold purpose: First, to check the already known dependence of filter-effluent quality on filter age as well as the steady-state operation, and second, to define the correlation between turbidity and iron content in the filter effluent. The experiments were performed with iron trace analyzer and low-range turbidimeter, and turbidity and iron content were shown to be highly correlated. Additionally, the experiments have proven that the turbidimeter and iron analyzer can be used for continuous monitoring of the filter effluent of well-origin water, except when there are iron compounds present or when there is any solid phase other than insoluble iron compounds suspended in the water. Comparing these two types of instruments reveals that turbidimeters are preferable because they have shorter time constants, are less expensive, and are easier to operate and maintain. (Campbell-NWWA)

DIGGING INTO MINE WASTE.
Environmental Science and Technology, Vol 8, No 2, p 110-111, February 1974. 2 fig.

Descriptors: *Mine wastes, *Mine water, *Mine acids, Talus, Pollutants, Pollution abatement, Waste disposal, Mine drainage.
Identifiers: Tailings, Mound stabilization.

The Department of the Interior projects that by the year 2000, more than 30 million acres in the U.S. will be affected by mining operations. The disposal of the solid waste, and the treatment of polluting mine waters from large scale operations represents a major threat to the environment. Acid or alkaline mine waters created by the disruption of stable aquifer and stream systems must be neutralized if possible. In those mining operations where water plays an integral part in the mining operations, it must be cleared before it is discharged. Solid wastes in the form of tailings represent a major eyesore and a potential pollutant of air and water. The immediate problem with solid mine wastes is to stabilize them against dusting and slumping. Using solid mine waste as a raw material is another approach in dealing with spoil piles. In the future, mine tailings might be used as a growing medium for grasses and brush after being disposed of in low-lying areas. New innovative approaches to surface mining that minimize environmental disturbance are needed for future mining operations. (Martino-NWWA)

SUBSURFACE DISPOSAL OF WASTE IN CANADA, INJECTION OF LIQUID WASTES IN DEEP WELLS, A PRELIMINARY APPRAISAL,
Department of the Environment, Ottawa (Ontario). Inland Waters Branch.
R. O. Van Everdingen, and R. A. Freeze.
Technical Bulletin No. 39, 1971. 64 p, 7 fig, 3 tab, 4 append.

Descriptors: *Waste disposal, *Underground waste disposal, *Injection wells, *Canada, Water pollution sources, Liquid wastes.
Identifiers: *Subsurface disposal, Disposal sites.

A general appraisal is presented of the principal limitations of the potential of subsurface disposal. A discussion of the qualification of waste for subsurface disposal is followed by a review of the criteria to be applied for the proper selection of disposal regions, sites and geologic formations, and chapters on subsurface facilities and their potential failures. After a review of the method in Canada, requirements in the field of legislation and regulation are outlined, followed by a discussion of those aspects of the methods that are in need of further research. WATER SUPPLY IMPROVEMENT PROJECT,
Ohio Dept. of Health, Columbus. Div. of Sanitation.
J. D. Daulton, and D. E. Kos.
Appalachian Regional Commission, Final Report, 1973. 165 p, 73 fig, 36 tab, 27 ref, 6 append. Grant 05H 00009401, ARC 202 funding.

Descriptors: Sampling, Water pollution sources, *Water supply, Sewage treatment, *Ohio.
Identifiers: *Community hygiene, Health planning, Environmental health.

Preliminary results are presented of a survey of private water supplies in seven counties served by the Ohio Valley Health Services Foundation. These counties include: Athens, Gallia, Hocking, Jackson, Lawrence, Meigs, and Vinton. The project was a voluntary program of sampling and collection of information regarding the private water developments in the area. Data were collected and stored on computer print-outs and tapes for future reference. It was found that 48.3% of the water supplies tested positive for coliform bacteria and therefore, were considered unsafe. The random distribution of the safe and unsafe water samples are interpreted to mean that groundwater pollution is not the principal cause for unsafe water. Sampled water supplies analyzed for nitrates were found to be less than the Public Health Service recommended maximum of 45 mg/l. (Campbell-NWWA)
W74-09542

GROUNDWATER QUALITY. DOOR COUNTY, WISCONSIN.
Wisconsin Univ., Madison. Inst. for Environmental Studies.
Report 7, May 1973. 215 p, 9 fig, 33 tab, 13 plates, 16 ref.

Descriptors: *Groundwater, *Water quality, *Economic impact, *Recreation, *Wisconsin, Institutional constraints, Physical properties, Social aspects, Land use, Public health, Legislation, Waste water disposal, Septic tanks, Water supply, Control, Regional development, Environmental effects, Economics, Social values, Sewerage, Waste water treatment, Zoning, Costs, Tourism.
Identifiers: *Door County(Wis.), Economic development.

Trade-offs between economic development, groundwater quality, and growing tourism is explored for a portion of Door County, Wisconsin. A land use suitability study of the region was conducted. While the area provides diversified terrain, vegetation, and soil types, only about 8% of the total study area can support conventionally installed septic tanks while 23% utilize modified home systems. Soil evidence suggests that the corridor should be closely regulated to prevent future groundwater degradation. The effectiveness of Wisconsin public health controls and local organizations and institutions designed to control waste disposal systems is evaluated. Lack of staff, varying test procedures, and lack of waste disposal alternatives are among problems cited. The applicability of land use control devices including zoning, differential taxation, and easements to preserve water quality is assessed. The environmental impact resulting from continued development in the county are identified and the impact of declining water quality on tourism is evaluated; tourist surveys indicate potential losses if water quality continues to decline. Finally, the potential for public sewage and water systems in Door County is described including construction difficulties, funding sources, and possible costs. (Schroeder-Wisconsin)

CHEMICAL DESCRIPTIONS OF THE OCEANS,
Scripps Institution of Oceanography, La Jolla, Calif.
E. D. Goldberg.
Technology Review, Vol 72, No 8, p 25-29, June 1970, 4 fig.

Descriptors: *Sea water, *Water pollution, *Oceans, Marine biology, Aquatic life, Aquatic plants, Radioactive waste disposal, Mercury, Lead, DDT, Foods.
Identifiers: Marine chemistry.

A general essay is presented on the chemical makeup of the oceans and what has been and is being done to use these resources wisely and deal effectively with misuse and contamination. Sodium chloride has been extracted from the oceans for centuries, but recently other elements such as magnesium and bromine are being commercially removed from sea water, and in the very near future, one of the most important constituents of sea water worthy of mining may be the water itself. Living organisms of the sea constitute a valuable food source to man, because the primary production of organic matter by the photosynthesizing plants of the sea yields a food base for the higher organisms. The nuclear era has significantly widened knowledge of the composition of sea water. There is no evidence that radioactive pollutants from nuclear power plants have had any widespread adverse effects on marine communities, and these additions of radioactivity provide convenient tags on the movements of waters and sediments. The main danger facing oceans today is the inputs by man, such as lead, mercury, pesticides and oil, which have equaled or exceeded inputs by rivers. Monitoring pollution now forms a most significant area of investigation in marine chemistry. (Jernigan-Vanderbilt)

MERCURY AND OTHER METALS IN BRITISH SEALS,
Institute for Marine Environmental Research, Lowestoft (England). Fisheries Lab.
P. B. Heppleston, and M. C. French.
Nature, Vol 243, No 5402, p 302-304, June 1973. 2 fig, 4 tab, 11 ref.

Descriptors: *Marine animals, *Mammals, *Mercury, Heavy metals, Lead, Cadmium, Analytical techniques, Testing procedures, Spectroscopy, Laboratory tests, Distribution, *Metals.
Identifiers: *Seals, *United Kingdom.

Soft-tissue samples taken from ninety-six seals, both common seals and grey seals, from six sites around Britain between February 1968 and January 1972 were analyzed for mercury and other heavy metals. The following conclusions are suggested: mercury reaches a ceiling level in brains at about 12-18 months; residues in man reach similar levels and also show no correlation with age. Mercury tends to accumulate in the liver, with age, reaching fairly high levels. Cadmium accumulates in the kidney, as it does in man, where it is known to occur in higher concentrations than in other organs. There do not seem to be regional differences in metal concentrations in the teeth, but some metals were found in greater quantities in younger seals than in old ones, probably related to the pattern of tooth growth. Regional differences in the amounts of mercury in the tissues do not seem to be related to possible agricultural or industrial pollution. The importance of taking age into account when studying the amounts of metals in biological tissues is stressed. (Jernigan-Vanderbilt)
W74-09571

A SURVEY OF TRACE METALS IN HUMAN HAIR,
Lamar Univ., Beaumont, Tex. Dept. of Chemistry.
E. A. Eads, and C. E. Lambdin.
Environmental Research, Vol 6, p 247-252, 1973. 5 tab, 9 ref.

Descriptors: *Lead, *Mercury, *Cadmium, *Zinc, *Industrial wastes, Spectrophotometry, Toxicity, Public health, Laboratory tests, Distribution, *Texas, Trace elements.
Identifiers: Atomic absorption spectroscopy, *Human hair, Port Arthur(Tex).

Metals of recent concern: Pb, Hg, Cd, Ni, Mn, Zn, and Cu (products of industrial pollution and auto exhaust emissions which enter the body through various means) were determined in selected hair samples from subjects from the petroleum and petrochemical complex of Port Arthur, Texas. Men's samples representing ages 9-60 yrs and emale samples representing ages 13-72 yrs were taken. They were soaked and rinsed in de-ionized water and in methanol to remove impurities, after which atomic absorption spectrophotometry was used to determine trace metal content. The data from the environmental studies offered a correlation of metals concentration as a function of hair color and age. Zinc and copper appear to be more related to natural hair pigmentation than the environmental levels. In both male and female samples Cd, Ni, Mn, and Cu were fairly uniformly distributed while extensive variations were observed for Pb, Hg, and Zn. The concentration of lead in the hair of males seemed to increase with the age, but no other trends were apparent in the male subjects. Reasonably close agreement between determined and published values was noted for all metals except lead. This is attributed to the higher airborne lead content in a gasoline production center. (Jernigan-Vanderbilt)
W74-09573

MERCURY IN TUNAS: A REVIEW,
Inter-American Tropical Tuna Commission, La Jolla, Calif.
C. L. Peterson, W. L. Klawe, and G. D. Sharp.
Fishery Bulletin, Vol 71, No 3, p 603-613, 1973. 1 fig, 2 tab, 35 ref.

Descriptors: *Mercury, *Fish, *Toxicity, Public health, Contaminants, Organic compounds, Inorganic compounds, Distribution, Standards, *Reviews.
Identifiers: Concentration, *Tuna.

Mercury in the aquatic environment comes from both natural processes and industrial activities. The latter probably have not significantly altered the mercury content of the high seas where most tunas are captured. Mercury compounds enter aquatic organisms through the food web and/or by direct extraction from solution. The relative importance of these pathways in tunas is unknown. Mercury occurs in tuna principally in the form of methylmercury. Generally, tunas appear to have higher mercury levels than those fish species which occupy a lower level in the food chain. Mercury content of tunas varies according to fish size. However, other factors such as area of capture, differential growth rates, varying analytical techniques, and different sampling methods may account for some of the observed variation. The U.S. Food and Drug Administration has established an 'in-house' standard of 0.5 ppm of mercury for fishery products sold in the United States. Other countries have established limits as high as 1.0 ppm. (Jernigan-Vanderbilt)

CADMIUM: MODE OF OCCURRENCE IN ILLINOIS COALS,
Geological Survey, Urbana, Ill.
H. J. Gluskoter, and P. C. Lindahl.
Science, Vol 181, p 264-266, July 1973. 1 fig, 1 tab, 13 ref.

Descriptors: *Cadmium, *Coals, *Zinc, Analytical techniques, Laboratory tests, Testing procedures, Spectroscopy, Distribution, *Illinois, Trace elements.
Identifiers: Sphalerites.

In an investigation of the potentially volatile trace elements in coals relatively high Cd and Zn concentrations were found in several Illinois coals. All coal samples analyzed were either face channel or drill core samples and were representative of the entire coal seam, with the exception of mineral bands over 0.95 cm thick. The coals were ashed and then analyzed by atomic absorption spectrophotometry. The cadmium content of 23 Illinois coals ranges from less than 0.3 to 28 parts per million. The higher cadmium contents are found in coals that also have a relatively high zinc content (18 to 3100 ppm). Cadmium occurs in these coals in solid solution, replacing zinc in the mineral sphalerite (ZnS). The ratios of zinc to cadmium in sphalerites are similar to the ratios of zinc to cadmium in the whole coals from which the sphalerites were separated. (Jernigan-Vanderbilt)
W74-09578

HEAVY METAL ESTIMATION IN BIOLOGICAL SYSTEMS,
Bristol Univ. (England). School of Chemistry.
G. Nickless.
Chemistry and Industry, p 715-718, August 1973. 1 fig, 2 tab, 25 ref.

Descriptors: *Trace elements, *Toxins, *Organic matter, *Analytical techniques, Mercury, Mass spectrometry, Cadmium, Instrumentation, Colorimetry, Spectroscopy, Regulation, Monitoring.
Identifiers: Sample preparation.

Problems in determination of trace elements in water, air and biological systems include lack of standard procedures, necessity for different methods for different samples and the presence of trace amounts of heavy metals as essential to biological systems. Decomposition of the sample in preparation for analysis must be preceded by a consideration of the type material analyzed, the elements and forms analyzed for, precision and occuracy required, sample size, time allowed, cost and difficulty of analysis. Pros and cons of dry and wet decomposition, application of biological standards (orchard leaves or beef liver), and the three main groups of instrumental methods (electroanalysis, optical methods, and mass spectrometry and neutron activation analysis) are discussed briefly. Examples of the concentration power of organisms are given. Long-term sublethal hazards to heavy metals are just beginning to be noticed. A decision must be made whether to accept them as a hazard of the 20th century or to implement control at the source through tougher legislation. (Jernigan-Vanderbilt)

APPLICATION OF ERTS-1 IMAGERY IN THE VERMONT-NEW YORK DISPUTE OVER POLLUTION OF LAKE CHAMPLAIN,
Vermont Univ., Burlington. Remote Sensing Lab.
A. O. Lind.
Available from NTIS, Springfield, Va. 22151 as N74-11183, Price $3.00 printed copy; $1.45 microfiche. National Aeronautics and Space Administration Contract Report CR-135962, October 1973. 5 p, 1 fig, 3 ref. NASA Contract NAS 5-21753.

Descriptors: *Remote sensing, *Path of pollutants, *Lakes, *New York, *Vermont, Pulp wastes, Pulp and paper industry, Water pollution, Mapping, Legal aspects.
Identifiers: *Lake Champlain.

Three ERTS-1 images from different dates were used to document the effluent pattern in Lake Champlain emanating from the large papaer mill north of Fort Ticonderoga, N.Y. A composite map shows the plume. The State of Vermont is currently suing both the International Paper Company and the State of New York for degrading the waters of Lake Champlain in Vermont. Vermont proposed that the map and the enlarged reproductions of ERTS imagery be entered in evidence. The special U.S. Supreme Court Master accepted the ERTS imagery and the ERTS-derived information in evidence. This is the first time that satellite imagery and satellite-derived information have been used as evidence in a court of law. (Knapp-USGS)
W74-09585

AN OCEANOGRAPHIC OBSERVATION OF NEW YORK BIGHT FROM ERTS-1,
Atlantic Oceanographic and Meteorological Lab., Miami, Fla. Physical Oceanography Lab.
R. L. Charnell, and G. A. Maul.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. National Oceanic and Atmospheric Administration Technical Report ERL 262-AOML 9, February 1973. 8 p, 2 fig, 1 ref.

Descriptors: *Remote sensing, *Bays, *Path of pollutants, Water quality, Coasts, New York, Satellites(Artificial), Industrial wastes, Acids, Turbidity, Data collections.
Identifiers: *New York Bight, *ERTS.

The Earth Resources Technology Satellite (ERTS-1), made a transit over New York Bight on August 16, 1972. Imagery from this transit shows several oceanographic features that demonstrate the usefulness of remote sensing over a large area for the synoptic observation of changes in water quality in the coastal zone. Both the extent and turbulent character of the Hudson River plume are discernible. Residue from a dump of waste acid is visible over a 5-mile area in the apex of the bight. Little dispersion of this residue has occurred. This feature will be a persistent signature in images from future satellite transits. (Knapp-USGS)

GROUNDWATER POLLUTION.
Available from Underwater Research Institute Publications, 4331 Humphrey, St. Louis, Mo. 63116, $5.00. Underwater Research Institute, St. Louis, Missouri, 1973. 198 p.

Descriptors: *Water pollution sources, *Groundwater, *Conferences, Path of pollutants, New England, Lakes, Septic tanks, Coal mines, Acid mine water, Saline water intrusion, Farm wastes, New Mexico, Data processing, Legal aspects, Urbanization.

Groundwater pollution was discussed in a conference held at St. Louis in 1973. The subjects include the effects of artificial lakes on groundwater, coal mine pollution, septic tanks, saline water invasion of aquifiers, pollution by agriculture, pollution of the Ogallala aquifer, data processing, legal aspects, pollutant transport, and the environmental effects of urbanization in New England. (See W74-09591 thru W74-09598) (Knapp-USGS)
W74-09590

THE EFFECT OF AN ARTIFICIAL LAKE DEVELOPMENT COMPLEX ON THE GROUNDWATER SYSTEM,
Wisconsin State Univ., Oshkosh. Dept. of Geology.
J. I. Hoffm ..., and N. Meland.

In: Groundwater Pollution; Proceedings of Groundwater Pollution Conference, October 1971, St. Louis, Missouri: Underwater Research Institute, St. Louis, p 1-12, 1973. 6 fig, 2 tab, 4 ref.

Descriptors: *Water pollution sources, *Groundwater, *Lakes, *Artificial lakes, Land use, Surface-groundwater relationships, Urbanization, Water pollution control, *Wisconsin.
Identifiers: *Legend Lake(Wisc).

Lakes exceeding 1,000 acres are being created in response to a demand for recreational lake property. Legend Lake, a newly created 1,270-acre artificial lake near Keshena, Wisconsin, offered a unique chance to try to evaluate environmental, economic, and social aspects of man's influence on a lake and its surrounding area. A long-range program of monitoring water quality, shoreline erosion, plant growth, and changes in the groundwater system was begun in 1969, along with attempts to evaluate social and economic impact. Construction of Legend Lake caused an increase in the height of the groundwater table, which resulted in a tree kill. Groundwater flow was reversed in some areas, and those regions influenced by reversed flow will probably experience some increase in water hardness. The use of septic tanks near the shorelines of developed lakes appears to have stimulated eutrophication of many of these lakes. Tertiary sewage treatment or nutrient removal systems would better insure that groundwater and surface waters would remain free of pollution. (See also W74-09590) (Knapp-USGS)
W74-09591

COAL MINING AND ITS EFFECT ON WATER QUALITY,
Ohio Univ., Athens. Dept. of Geology.
M. U. Ahmad.
In: Groundwater Pollution; Proceedings of Groundwater Pollution Conference, October 1971, St. Louis, Missouri: Underwater Research Institute, St. Louis, p 13-52, 1973.

Descriptors: *Water pollution sources, *Acid mine water, *Coal mines, Coal mine wastes, Strip mines, Ohio, Mine acids, Strip mine wastes, Hydrogeology, Path of pollutants.

Coal mining has seriously degraded the water quality of streams in Appalachia and other parts of the United States, and in some cases has also damaged underground aquifers. In general quality of the water draining from coal mines is dependent upon the thickness of the shale lying directly over the coal being mined. Water from mines that have a thin layer over the coal is often non-acid or only mildly acid, while the mines that have thick shale over the coal have drainage that is slight to very acid. The Sheban Mine (79 acres) is a typical coal mine and is described in detail to illustrate a typical problem of acid discharge. The mine is located in the N.E. Quarter of Goshen Township, Mahoning County, Ohio. Since water is the transport media for carrying acid and salts from the mine environment, reducing the amount of water passing through an underground mine will reduce the amount of pollution. Mine sealing reduces the production of acid by excluding air from pyrite materials to prevent their oxidation. This has proved to be relatively ineffective. (See also W74-09590) (Knapp-USGS)
W74-09592

SEPTIC TANKS AND GROUNDWATER POLLUTION,
Illinois Inst. of Tech., Chicago. Dept. of Environmental Engineering.
R. A. Minear, and J. W. Patterson.
In: Groundwater Pollution; Proceedings of Groundwater Pollution Conference, October 1971, St. Louis, Missouri: Underwater Research Institute, St. Louis, p 53-71, 1973. 4 fig, 4 tab, 51 ref.

Descriptors: *Water pollution sources, *Groundwater, *Septic tanks, Soil disposal fields, Path of pollutants, Bacteria, Viruses, Organic matter, Domestic wastes.

About 13 million private septic tanks are in use in the United States today, with an additional half million being installed each year. This wide use of septic systems has persisted in the face of a consistent history of septic tank failure and the almost unanimous disapproval by public health engineers of their use in any except the most isolated households. Estimates of the number of septic tanks performing inadequately range up to 50% of those in use today. These malfunctional systems constitute a severe public health hazard and a major source of contamination of the environment. The most critical environmental effect of septic systems is contamination of groundwater and private well supplies. The soil is the primary treatment process of the septic system, and if the soil becomes clogged and overloaded with sewage, the system will quickly fail, with attendent health hazard, sanitary nuisance, and environmental pollution. (See also W74-09590) (Knapp-USGS)
W74-09593

POLLUTION OF GROUNDWATER BY SALT INVASION,
North Carolina State Univ., Raleigh. Dept. of Civil Engineering.
A.-A. I. Kashef.
In: Groundwater Pollution; Proceedings of Groundwater Pollution Conference, October 1971, St. Louis, Missouri: Underwater Research Institute, St. Louis, p 72-89, 1973. 12 fig.

Descriptors: *Saline water intrusion, *Groundwater, Aquifers, Hydrogeology, Withdrawal, Path of pollutants, Groundwater movement, Water pollution control, Artificial recharge, Groundwater barriers, Saline water barriers, Saline water-freshwater interfaces.

Coastal aquifers that have their boundaries in contact with saltwater bodies are invaded by saltwater. The extent depends upon climatic conditions, the characteristics of the natural flow within these aquifers, and the manner of groundwater usage. The invaded zones increase in size with overdraft of groundwater. The main known remedial measures are limiting water usage, artificial recharge, hydraulic barriers, pumping troughs, cutoff walls (or underground dams), and direct saltwater removal. (See also W74-09590) (Knapp-USGS)
W74-09594

GROUNDWATER POLLUTION BY AGRICULTURE,
Louisiana Tech. Univ., Ruston. Dept. of Agricultural Engineering.
J. W. D. Robbins, and G. J. Kriz.
In: Groundwater Pollution; Proceedings of Groundwater Pollution Conference, October 1971, St. Louis, Missouri: Underwater Research Institute, St. Louis, p 91-114, 1973. 2 tab, 97 ref.

Descriptors: *Water pollution sources, *Groundwater, *Farm wastes, Fertilizers, Return flow, Pesticides, Water pollution control, Soil water.

Agricultural enterprises produce wastes that may lead to rapid degradation of groundwater. Since most agricultural wastes are released at or slightly below the ground surface, water-table aquifers are especially vulnerable to contamination. Five major categories of agricultural groundwater pollutants are animal wastes, fertilizers, pesticides, plant residues, and saline irrigation-waste waters. Suggested approaches to solution of the problem include: detailed studies of a few representative sites, synthesis of results of research applicable to the problems, analyses of specific sites before commitments to water and waste projects have been made, evaluation of specific sites after contamination has occurred; and background studies for gaining an understanding to utilize the technology to control the undesirable degradation of groundwater. W74-09595

POLLUTION STUDIES OF THE REGIONAL OGALLALA AQUIFER AT PORTALES, NEW MEXICO,
Eastern New Mexico Univ., Portales. Dept. of Biological Sciences.
P. D. Bigbee, and R. G. Taylor.
In: Groundwater Pollution; Proceedings of Groundwater Pollution Conference, October 1971, St. Louis, Missouri: Underwater Research Institute, St. Louis, p 115-131, 1973. 6 fig, 17 ref.

Descriptors: *Water pollution sources, *Aquifers, *Groundwater, *New Mexico, Fertilizers, Septic tanks, Farm wastes, Water quality, Nitrates, Coliforms, Path of pollutants.
Identifiers: *Portales(NM).

The Ogallala Aquifer is polluted at Portales, N.M. The bacterial contamination of the aquifer is caused by cesspool and septic tank pollution and feedlot runoff. The nitrate concentrations in almost all wells sampled are above 10 ppm, and six of the wells are above 45 ppm. A large number of the irrigated fields in the Portales area are fertilized with ammonia which can be oxidized by the soil bacteria to form nitrates. Nitrates are water soluble and are not complexed by soil; therefore, they are easily leached from the soil and transported by water. The summer months are the time of year in Portales when irrigation is at its maximum, and a large amount of water is pumped onto the fields. (See also W74-09590) (Knapp-USGS)
W74-09596

POLLUTANT TRANSPORT AND ACCUMULATION PROCESSES IN OUR ENVIRONMENT--THE GENERAL THEORY AND A CASE STUDY OF MERCURY FROM THE FOUR CORNERS ELECTRIC POWER PLANTS AND IN NAVAJO LAKE, NEW MEXICO,
National Aeronautics and Space Administration, Albuquerque, N. Mex.
C. L. Hyder.
In: Groundwater Pollution; Proceedings of Groundwater Pollution Conference, October 1971, St. Louis, Missouri: Underwater Research Institute, St. Louis, p 159-173, 1973. 11 ref.

Descriptors: *Mercury, *Air pollution, *Water pollution sources, *Thermal powerplants, Coals, *New Mexico, Trace elements, Poisons, Lakes, Surface waters, Path of pollutants, Groundwater.
Identifiers: *Navajo Lake(N.M.).

Powerplant generation of pollutants, atmospheric transport processes, and topographical and biological concentration processes were studied theoretically. The results are applied to the coal-burning electric powerplants near Four Corners, New Mexico. The total amount of mercury produced by the powerplants and transported into a nearby lake (Navajo Lake, New Mexico) was predicted and compared with the total amount of mercury measured in Navajo Lake. The near-equilibrium concentrations of mercury in Navajo Lake were also compared with the predictions. The Four Corners electric powerplants are probably significant contributors to the mercury measured in fish taken from Navajo Lake. The same may be true of the San Juan arm of Lake Powell, Utah. (See also W74-09590) (Knapp-USGS)
W74-09597

SOME POTENTIAL ENVIRONMENTAL PROBLEMS FROM POPULATION EXPLOSION AND URBAN DEVELOPMENT IN MAS-

SACHUSETTS AND ADJACENT PARTS OF NEW ENGLAND,
Massachusetts Univ., Amherst. Dept. of Geology.
W. S. Motts.
In: Groundwater Pollution; Proceedings of Groundwater Pollution Conference, October 1971, St. Louis, Missouri: Underwater Research Institute, St. Louis, p 174-198, 1973. 8 fig, 2 tab, 23 ref.

Descriptors: *Water pollution sources, *Groundwater, *New England, Chlorides, Landfills, Garbage dumps, Salts, Deicers, Urbanization, Path of pollutants, Snow removal, *Massachusetts.

Some potential groundwater and environmental problems in Massachusetts and adjacent parts of New England may develop as an indirect result of an increase of population accompanied by increased housing and urban development, a proliferation of roads and highways, more landfills, and more industries. The nature and magnitude of these environmental problems are influenced to a large extent by the characteristic geology, soil types, vegetation, groundwater occurrence, and climate of the New England Topographic Province. The increase of chlorides in groundwater supplies is the result of addition of salts to highways, increases in general pollution due to additional domestic septic tank usage, increases of town dumps, the drought from 1960 through 1967, and effects of air pollution which increases the chloride content in precipitation. (See also W74-09590) (Knapp-USGS)
W74-09598

AN INTERDISCIPLINARY STUDY OF THE ESTUARINE AND COASTAL OCEANOGRAPHY OF BLOCK ISLAND SOUND AND ADJACENT NEW YORK COASTAL WATERS,
Long Island Univ., Greenvale, N.Y. Science Engineering Research Group.
E. F. Yost.
Available from NTIS, Springfield, Va. 22151 as E73-10819 - Price $3.00 printed copy; $1.45 microfiche. Interim Report to NASA Goddard Space Flight Center, June 1973. 3 fig, 1 tab.

Descriptors: *Remote sensing, *Water quality, *Estuaries, Satellites(Artificial), Turbidity, Sewage disposal, Path of pollutants, *New York.
Identifiers: *Block Island Sound(NY), ERTS.

ERTS-1 imagery of New York coastal waters was photographically enhanced to emphasize apparent water color differences. Water samples were collected simultaneously with the acquisition of satellite data. Water turbidity, particularly that arising from sewage dump areas, and sediment discharge from coastal inlets correlate well with the ERTS-1 color signatures. (Knapp-USGS)
W74-09602

CLOUD SEEDING FOR SNOW AUGMENTATION: LAND USE RAMIFICATIONS OF RESIDUAL SILVER IODIDE NUCLEATING AGENTS,
Colorado State Univ., Fort Collins. Dept. of Microbiology.
D. A. Klein, and R. A. Sokol.
Proceedings for sale by Western Snow Conference, R. T. Davis, Secretary, Rm. 360, U.S. Courthouse, Spokane, Wash. 99201 - Price $3.00.
In: Proceedings of the 41st Annual Meeting of the Western Snow Conference, April 17-19, 1973, Grand Junction, Colorado: Colorado State University, Fort Collins, p 30-36, 1973. 3 fig, 7 ref.

Descriptors: *Path of pollutants, *Cloud seeding, *Silver iodide, *Soil microbiology, Soil microorganisms, Soil environment.

In seeding winter storms in the Western USA, a possible concern in land use planning involves the potential effects residual silver iodide nucleating agents may have on soil microbial processes. If a seeding rate of 0.02 gram of silver/ha/cm of precipitation is used, then 60 cm of seeded precipitation could deliver 1.2 grams of silver as silver iodide/ha/year, or 0.12 mg of silver per surface square meter. Effects of varied silver forms on soil microbial respiration processes were carried out by use of a simplified respirameter using undisturbed surface soil cores of 6.5 cm diameter and 8.0 cm depth obtained in the Fort Collins area. Silver in the forms of silver iodide and silver nitrate were added to soils as acetone and water solutions respectively, and respiration indices were carried out over 10-day periods at 25 deg C in the dark. Silver iodide added to soils directly as a fine powder did not have discernible effects on soil respiration processes when carried out over short-term experiments. Up to 1.0 gram of silver iodide added to 100 grams of soil was not able to cause discernible decreases in all-over microbial respiration rates. Addition of silver in the form of silver nitrate, a freely-soluble silver form, was capable of causing discernible decreases in soil respiration rates when added at 1.0 ppm, and essentially complete cessation of microbial respirations occurred when 100 ppm were used, indicating that the form of silver added to a natural environment is more important than the total amount added. (Knapp-USGS)
W74-09606

CHANGES IN OXYGEN AND PRIMARY PRODUCTION OF THE PATUXENT ESTUARY, MARYLAND, 1963 THROUGH 1969,
Geological Survey, Edgewater, Md.
R. L. Cory.
Chesapeake Science, Vol 15, No 2, p 78-83, June 1974. 4 fig, 1 tab, 16 ref.

Descriptors: *Dissolved oxygen, *Primary productivity, *Eutrophication, *Estuaries, *Maryland, Respiration, Water temperature, Water pollution effects.
Identifiers: *Patuxent Estuary(Md).

Water quality was monitored from 1963 through 1969 in the upper-middle Patuxent estuary, near Benedict, Maryland. Over the period of record, a pronounced change occured in the diel oxygen measurement, particularly during the months of July, August, and September. Annual variations of dissolved oxygen ranged from 3.6 to 15.0 mg per liter in 1964 and from 2.3 to 16.5 mg per liter in 1969 with percentage saturation varying from 60% to 130% in 1964 and from 30% to 184% in 1969. The magnitude of diel summer oxygen variation changed from about 3 to 7 mg per liter per day over the same period. From hourly values of temperature, oxygen, and conductivity, gross primary production (GP) and respiration (R) were estimated. From the seasonal data, GP ranged from about 3 to 25 g of oxygen per sq m per day, and R ranged from about 4 to 32 g of oxygen per sq m per day. On average days, GP ranged from 2 to 10 g of oxygen per sq m per day in 1964 and from 1 to 16 in 1969. In 1964, daily average GP was 5.2 grams of oxygen per sq m per day as compared to 6.1 in 1969, and respiration was 6.1 grams of oxygen per sq m per day in 1964 versus 10.2 grams of oxygen per sq m per day in 1969, increases of 20% and 16%, respectively. Ratios of GP/R averaged 0.84 in 1964 versus 0.60 in 1969, reflecting a larger respiration in 1969 and suggesting a trend towards community instability. The increases in production were attributed to upstream domestic waste loading. If the present trend increases, metabolic imbalance and anaerobic conditions may develop. (Knapp-USGS)

PHYSICAL AND CHEMICAL CHARACTERISTICS OF SURFACE MINE SPOIL TREATED WITH FLY ASH,
Northeastern Forest Experiment Station, Princeton, W.Va.
W. T. Plass, and J. P. Capp.
Journal of Soil and Water Conservation, Vol 29, No 3, p 119-121, May-June 1974. 3 fig, 3 tab, 4 ref.

Descriptors: *Mine wastes, *Fly ash, *Waste dumps, *Land reclamation, *Strip mines, Water pollution control, Nutrients, Soil moisture, Infiltration, Vegetation.

Use of powerplant fly ash for surface mine reclamation offers an attractive outlet for large tonnages of this waste material. Research by the U.S. Bureau of Mines beginning in 1963 showed that fly ash could be used to neutralize extremely acid surface mine spoil. The agency's treatments favored establishment of grass and legume cover by modifying chemical and physical characteristics of the spoil. Changes that occurred in a spoil following the application of 150 tons of fly ash per acre are described. The treatment neutralized acidity, added plant-available phosphorus, lowered spoil density, and increased subsurface moisture. (Knapp-USGS)

CHEMICAL STUDIES OF SOLIDS, RUNOFF, SOIL PROFILE AND GROUNDWATER FROM BEEF CATTLE FEEDLOTS AT MEAD, NEBRASKA,
T. M. McCalla, J. R. Ellis, C. B. Gilberston, and W. R. Woods.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 211-223 (1972). 5 fig, 5 tab, 5 ref.

Descriptors: *Feed lots, *Agricultural runoff, *Soil profiles, Slopes, *Continuous flow, Chemical properties, Groundwater, Nitrogen, Phosphorus, Solid wastes, *Cattle, *Nebraska, *Farm wastes.
Identifiers: Batch system, Settleable solids, Cattle density, Electrical conductivity, Mead(Neb.).

A 4-year study at Mead, Nebraska, was made to determine the effects of cattle density and slope on possible pollution of surface water, soil profile, and groundwater from beef cattle feedlots. The batch system and the continuous flow system were used for removal of settleable solids from runoff. Chemical analyses were made of the wastes and runoff produced by these two systems. Conclusions were: (1) Feedlot runoff transports excess nutrients and must not be discharged into streams. (2) The quantity of volatile solids and nitrogen and phosphorus removal rates from the feedlot surface were proportional to stocking rate during mechanical cleaning. (3) An increase in the slope of the feedlot increased the quantity of total solids, volatile solids, nitrogen, and phosphorus removed from the feedlot. (4) The runoff data on these lots indicate that the variability is too great to determine the effect of feedlot slope on runoff quantity and quality. (5) Beef cattle feedlots with heavy, constant stocking on loess hills do not create a groundwater problem, but nitrate buildup was found in profiles of adjacent areas. (6) The soil texture of the retention structure and the procedure and materials used to seal the structure are necessary considerations in preventing nitrate accumulations in the soil profile and groundwater. BEEF BARNLOT RUNOFF AND STREAM WATER QUALITY,
Ohio Agricultural Research and Development Center, Worster.
R. K. White, and W. M. Edwards.

In: Waste Management Research Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 225-235 (1972). 6 fig, 1 tab, 6 ref. OWRR A-023-OHIO(2).

Descriptors: *Biochemical oxygen demand, *Chemical oxygen demand, *Water quality, *Cattle, *Ohio, *Farm wastes, Water quality standards, Solid wastes, Waste water treatment.
Identifiers: *Barnlot runoff, Volatile solids, Total solids, Clarksburg silt loam.

Objectives were to determine the concentration and amounts of solids and organic material in the runoff from a barnlot and to identify the effect of rainfall and runoff patterns and seasonal conditions on barnlot runoff quality. Runoff for a 16-month period from a 60 head beef cattle barnlot located on silt loam was sampled and analyzed for total solids (TS), volatile solids (VS), biochemical oxygen demand (BOD), and chemical oxygen demand (COD). Runoff usually occurs when rainfall exceeds .5 inches. Transport of TS is related to the volume of runoff. BOD concentration and transport are larger in winter and smaller in summer except for the periods following dry antecedent conditions. Concentrations of TS, BOD, and COD are variable within a runoff event. Average yearly runoff, based upon 3 year records, is presented. A yearly BOD concentration curve for runoff is projected. An estimate of yearly transport of BOD can be projected from these two relations. (See also W74-09663) (Marquard-East Central)

W74-09695

CONTRIBUTION OF ANIMAL WASTE TO NITRATE NITROGEN IN SOIL,
Pennsylvania State Univ., University Park.
J. F. Marriott, and H. D. Bartlett.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 435-440, (1972). 1 fig, 2 tab, 1 ref.

Descriptors: *Farm wastes, *Waste disposal, *Nitrogen, Soils, Rates of application, *Slurries, Water pollution, Groundwater, Dairy industry, Odor, *Waste water treatment, Path of pollutants.
Identifiers: Hagerstown silt loam, Suction lysimeters, *Nitrate nitrogen.

Research was done to determine the movement and accumulation of nitrate nitrogen in soil after dairy manure slurry was applied below the surface of grass sod. Odor control was also to be determined. A liquid spreader spread slurry of 12.5% solids and 2.35% total N (dry matter basis) four inches below surface at treatment rates of 0, 15, 30, 45, 60, and 75 tons of moisture. Suction lysimeters were installed in each plot at depths of 1, 2, 3, and 4 feet for the purpose of sampling soil water. Samples were taken at 14 day intervals in 1970 and at monthly intervals in 1971. Soil samples were also taken. Both types of samples were analyzed for nitrate, ammonium nitrogen, chloride, and sodium. Even the lowest application rate of 15 tons per acre indicated enough nitrate excess to be a potential pollution hazard. Disposal of wastes in this manner practically eliminated odors. (See also W74-09663) (Marquard-East Central)

SURFACE RUNOFF NUTRIENT LOSSES FROM VARIOUS LAND DISPOSAL SYSTEMS FOR DAIRY MANURE,
Cornell Univ., Ithaca, N.Y. Dept. of Agronomy.
P. J. Zwerman, S. D. Klausner, D. R. Bouldin, and D. Ellis.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 495-502, (1972). 3 tab, 12 ref. EPA 13030 DPB.

Descriptors: *Agricultural runoff, *Waste disposal, *Farm wastes, *Nitrogen, *Phosphorus, Nitrates, Dairy industry, Crop rotations, Corn(Field), Alfalfa, Oats, Wheat, Organic matter, Rainfall simulators.
Identifiers: Nutrient losses, Soil loss, Orthophosphates.

Sixty randomly selected plot locations were subject to surface runoff tests with a rainfall simulator. Storm frequencies corresponding to 2, 10, and 20 years were applied in sequence to each plot. Soil condition results represent the effects of fourteen years of past management on seed beds prepared for corn. Heavy mineral fertilization increased runoff by 50%. Lack of a 6 ton manure application increased runoff 100%. Orthophosphate was increased by increased phosphate fertilizer. Runoff, nitrate, and orthophosphate increased with rain application. Increased mineral fertilization doubled the losses of soil, organic matter, total nitrogen, and total phosphorus. Six ton manure applications cut these losses in half. All losses increased with increased water applications. A two-by-four factorial analysis study again involved six tons of manure plowed down versus no manure on four crop rotations. All were at moderate rates of mineral fertilization. The rotations were: (1) continuous corn; (2) corn-corn-oats-alfalfa-alfalfa; (3) corn-oats-alfalfa-alfalfa; and (4) wheat-alfalfa-alfalfa-alfalfa-alfalfa. Manure effect in these rotations was non-significant. In (1) and (4), manure decreased or did not effect runoff, soil, and nutrient losses. In (2), manure significantly increased organic matter and total nitrogen loss. It increased runoff, nitrates, soil loss, and total phosphorus. In (3), manure significantly increased total phosphorus. It decreased nitrate. It increased soil loss, organic matter, and total nitrogen. (See also W74-09663) (Marquard-East Central)

STUDIES OF THE SEASONAL VARIATION OF THE SUSPENDED MATTER OF THE MENAI STRAITS. II. MID STREAM DATA,
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
S. Buchan, G. D. Floodgate, and D. J. Crisp.
Deutsche Hydrographische Zeitschrift, Vol 26, No 2, p 74-83, January, 1973. 9 fig, 2 tab, 3 ref.

Descriptors: *Correlation analysis, *Suspended load, Tidal streams, Water temperature, Wind tides, *Organic matter, Inorganic compounds, Bottom sediments, Turbidity, *Sediment load.
Identifiers: Surface sediments, *Menai Straits.

Surface and bottom inorganic and organic suspended loads in the Menai Straits were correlated with hydrographic and meteorologic elements which impart an influence on them. Surface inorganic loads correlated significantly with tidal range, water temperature, and run of wind. This latter factor did not relate well with the bottom inorganic fraction. Significant correlations were evident between surface and bottom organic loads and the tidal range. Turbidity and suspended sediment load were also investigated. (Sandoski-FIRL)

LEAD, CD, ZN, CU, AND CO IN STREAMS AND LAKE WATERS OF CAYUGA LAKE BASIN, NEW YORK.
Cornell Univ., Ithaca, N.Y. Dept. of Agronomy.
J. Kubota, E. L. Mills, and R. T. Oglesby.
Environmental Science and Technology, Vol 8, No 3, p 243-248, March, 1974. 4 fig, 6 tab, 21 ref.

Descriptors: *Heavy metals, *Lead, *Cadmium, *Zinc, *Copper, *Cobalt, Lakes, *New York, Surface waters, Spatial distribution, Seasonal, Trace elements, Sediment transport, *Trace elements, Path of pollutants.
Identifiers: *Cayuga Lake basin(NY).

Waters of 12 tributary streams of Cayuga Lake were studied to determine the levels and seasonal and geographic patterns of trace elements in the Cayuga Lake basin, a primarily rural area. Trace elements in soluble form (filtered water) and in suspended particulates were studied. The trace element concentrations were generally low, but a seasonal pattern reflecting higher concentrations with high stream flow was noted in the case of Pb. Values for streams of rural areas reflect levels associated with normal geochemical processes and soil weathering. An impact of urbanization was reflected in higher levels of the trace elements in suspended particulates carried by these streams that flow through Ithaca, N.Y. A basis has been established to evaluate changes in trace elements load with future changes in land use and urbanization. (Jernigan-Vanderbilt)

MIGRATION AND REDISTRIBUTION OF ZINC AND CADMIUM IN MARINE ESTUARINE SYSTEM,
Geological Survey, Corpus Christi, Tex.
C. W. Holmes, E. A. Slade, and C. J. McLerran.
Environmental Science and Technology, Vol 8, No 3, p 255-257, March 1974. 10 fig, 2 tab, 11 ref.

Descriptors: *Zinc, *Cadmium, *Migration patterns, *Distribution patterns, Trace elements, Water analysis, *Path of pollutants, Coasts, Spatial distribution, *Texas, Sediments, Estuaries, Spectroscopy.
Identifiers: Atomic absorption spectroscopy, Coastal management, *Corpus Christi Bay(Tex).

The estuarine sediments of Texas in Corpus Christi Bay have anomalously high concentrations of zinc and cadmium. Data are presented on the distribution of these elements in the sediments, their seasonal variations, and the pathways by which they move within the estuarine system. 287 sediment and 156 water samples were taken and

analyzed for zinc and cadmium by atomic absorption spectrophotometry. Sediment zinc concentrations in the bay ranged from a maximum of 235 ppm near the entrance of the harbor to a minimum of 6 ppm, and cadmium concentrations ranged from a high of 1.9 ppm to a low of 0.1 ppm. In the harbor sediments, zinc ranged from a maximum of 11,000 ppm, approximately 8 km from the harbor entrance to a minimum of 235 ppm at the entrance. Cadmium ranged from 130 ppm to 2 ppm. Correlation of 0.80 between the zinc and cadmium concentrations in the bay and harbor sediments indicated an identical source. The zinc and cadmium concentrations in the bay are the result of transfer from harbor sediments, mainly in winter, even after the effluent from industrial processes is stopped. (Jernigan-Vanderbilt)

OCCURRENCE OF LI, B, CU, AND ZN IN SOME EGYPTIAN NILE SEDIMENTS,
Goettingen Univ. (West Germany). Sediment-Petrographisches Institut.
M. M. Ashry.
Geochimica et Cosmoshimica Acta, Vol 37, p 2449-2458, 1973. 8 fig, 2 tab, 22 ref.

Descriptors: River systems, *Boron, *Clays, *Sediments, *Copper, *Zinc, Testing procedures, Analytical techniques, *Water analysis, Heavy metals, Spectroscopy, Colorimetry, X-ray fluorescence, Trace elements.
Identifiers: *Nile River, Egyptian delta, *Lithium.

Lithium, boron, copper and zinc have been determined on cored and surface sediments from the delta and the drainage valley of the Nile River. The clay size fraction separated from the samples consists of montmorillonite and kaolinite as the predominant clay components, followed by illite and chlorite. Quartz and calcite are the non-clay admixtures. Lithium content varies between 7 and 48 ppm in the bulk sediments and between 28 and 61 ppm in the clay fractions, being clearly enriched in the clay material. In the clay fractions, concentration of lithium in kaolinite is indicated by a close relation between the lithium and kaolinite contents and is further supported by a close correlation with Al2O3. Boron in the clay fraction (62-112 ppm) appears to be concentrated in detrital illite. The concentrations of copper (26-900 ppm) and zinc (65-333 ppm) in the clay fractions correlate positively with the CO2 percentage. Both elements tend to occur in or on the clay-sized grains of calcite. (Jernigan-Vanderbilt)

PARTICULATE LEAD CONTAMINATION RECORDED IN SEDIMENTARY CORES FROM LAKE WASHINGTON, SEATTLE,
Washington Univ., Seattle. Dept. of Oceanography.
E. A. Crecelius, and D. Z. Piper.
Environmental Science and Technology, Vol 7, No 11, p 1053-1055, November 1973. 4 fig, 16 ref.

Descriptors: *Lead, Lakes, Sediments, Fir trees, *Path of pollutants, Water pollution sources, Spatial distribution, Temporal distribution, *Washington, *Lake sediments, Spectroscopy.
Identifiers: Atomic absorption spectroscopy, *Lake Washington(Wash).

The aim was to evaluate the present relative contribution of lead to the environment by autos and smelters and the relative change in the overall level of lead pollution from the time of the development of the Seattle area, approximately 1880, to the present. To estimate past levels of lead pollution in the area, two sedimentary gravity cores were taken from Lake Washington which forms the eastern boundary of Seattle. To identify present-day sources, the distribution of lead in the needles of Douglas fir trees in the vicinity of the Tacoma smelter (35 km SSW of the lake) and near and distant from major highways was determined. Both types of samples were measured by atomic absorption spectrometry. The lead concentration in the cores exhibits an increase from about 25 ppm at the 30-50 cm depth to about 400 ppm in near surface sediment; this represents a twenty-fold increase during the past 80 years. Much of this increase is probably due to lead additives in gasoline introduced during the 1920's. The highest lead values in the fir needle samples (100 ppm) were observed in those trees located near major highways. This distribution of lead supports the conclusion that automobiles represent the major source of lead pollution to the lake today. (Jernigan-Vanderbilt)

AUDUBON BLACK PAPER NUMBER 1, OIL POLLUTION,
M. Zeldin.
Audubon, Vol 73, No 3, p 99-119, May 1971.

Descriptors: *Water Quality Act, *Legislation, *Oil spills, *Oil pollution, Water pollution, Disasters, Water law, Treaties, Oil industry, Offshore platforms, Drilling, Legal aspects, Regulation, Oil wastes.
Identifiers: *Oil Pollution Act, *Environmental Protection Agency, *International Convention for Prevention of the Pollution of the Sea by Oil, Water Quality Improvement Act.

In 1970, an estimated five million tons of crude oil or petroleum products were spilled into the waters of the world, half of the major spills occurring within one mile of shore. Tankers and other ships accounted for one-fifth of the oil spilled, with inadequate equipment and negligent operation a major cause, as well as inadequate regulation by nations which allow ships to fly their flags of convenience. Inadequate facilities at refineries contribute another three hundred thousand tons of oil pollution. A lack of pollution control laws also aggravates the problem. Following a spill in Cape Cod's Buzzard Bay, a team of scientists using the most modern methods of chemical analysis and biological observation, concluded that crude oils were poisons to all marine organisms, and many crude oil distillates are even more poisonous due to higher proportions of toxic compounds. The Water Quality Improvement Act, administered by the Environmental Protection Agency, has given the government new tools to prevent and control oil pollution, but there are continuing problems of oil lumps at sea, spills from offshore oil drilling, and destruction of wildlife. REPORT ON 'IN SITU' BENTHIC RESPIRATION AND VERTICAL OXYGEN: TEMPERATURE PROFILES.
In: Cooper River Environmental Study: South Carolina Water Resources State Water Plan Report No 117, p 52-61, April 1974. 1 fig, 12 tab.

Descriptors: *Dissolved oxygen, *Estuaries, *Respiration, *South Carolina, *Oxygen demand, Water pollution, Water pollution effects, Water temperature, Reaeration, Mixing.
Identifiers: *Cooper River(SC).

Benthic respiration data were collected at pre-established stations on the Cooper River, South Carolina. A chamber was placed on the river bottom at each of eight pre-established, permanent, stations on the Cooper River. The eight stations were divided into two groups of four, and the dissolved oxygen within the chambers determined on alternate days. A zero, or initial reading, was taken in the morning; another reading was taken five hours later, and then again after 48 hours. Oxygen consumption is rapid during the initial five hours followed by a stabilization of the oxygen uptake during the balance of the 48 hour periods. This indicates a metabolic stabilization. The Cooper River is well oxygenated from surface to bottom. (See also W74-09379) (Knapp-USGS)
W74-09384

TOXICITY OF SODIUM NITRILOTRIACETATE (NTA) TO THE FATHEAD MINNOW AND AN AMPHIPOD IN SOFT WATER,
National Water Quality Lab., Duluth, Minn.
J. W. Arthur, A. E. Lemke, V. R. Mattson, and B. J. Halligan.
Water Research, Vol 8, p 187-193, March 1974. tab, 11 ref.

Descriptors: *Nitrilotriacetic acid, *Toxicity, *Bioassay, *Amphipoda, Minnows, Water pollution effects, Lethal limit, Sodium compounds.
Identifiers: NTA toxicity, *Fathead minnows, *Gammarus pseudolimnaeus.

Amphipods, Gammarus pseudolimnaeus Bousfield and fathead minnows, Pimephales promelas Rafinesque, were submitted to acute (96-h) and chronic (generation-cycle) bioassays with sodium nitrilotriacetic acid (NTA). All measurements are reported as Na3NTA. The average 96-h TL50 values under flow-through conditions were 98 mg/liter NTA for the amphipod and 114 mg/liter for the fathead minnow. The acute toxicity of NTA was caused in part by the high pH resulting from the addition of large amounts of NTA (greater than 100 mg/liter) to soft water. Controlling pH reduced the lethality of NTA by at least one-half to fathead minnow larvae. The chronic no-effect level of NTA to the amphipods was 19 mg/liter; in fathead minnows, it exceeded the highest exposure level (greater than 54 mg/liter). (EPA)

PHOSPHORUS STUDIES IN LOWER GREEN BAY, LAKE MICHIGAN,
Wisconsin Univ., Madison. Dept. of Water Chemistry.
N. Sridharan, and G. F. Lee.
Journal Water Pollution Control Federation, Vol 46, No 4, p 684-696, April 1974. 9 fig, 7 tab, 16 ref.

Descriptors: *Phosphorus compounds, *Sediments, *Water pollution, *Lake Michigan, Pollutants, Water pollution sources, *Wisconsin, Industrial wastes, Municipal wastes, Water quality, Biochemical oxygen demand, Turbidity, Lakes, Great Lakes, Limnology, Water analysis, Water pollution control, Rivers, Bays, Bottom sediments, Iron, Waste water(Pollution).
Identifiers: *Green Bay(Wisc), Fox River(Wisc).

Chemical analysis of Lake Michigan sediments suggested the presence of phosphorus in association with iron, and laboratory leaching experiments showed significant phosphorus release from Green Bay sediments under both aerobic and anaerobic conditions. The phosphorus budget for the Fox River, the major source of phosphorus in lower Green Bay, indicated that 60% of the total input came from municipal and industrial waste waters. By reducing the phosphorus concentrations in these waste waters by 80% (as a result of the Environmental Protection Agency-State of Wisconsin agreement) the total phosphorus input decreased by 50% in the Fox River water, and by 40% in the Bay as a whole. Because the water quality problems of lower Green Bay also include high BOD and turbidity, the removal of 80% of phosphorus from the waste water discharged in the tributaries of southern Green Bay produced little improvement of water quality in the southern part of the Bay. The removal of 80% of the phosphorus from the waste water sources is justified on the basis of protection of Lake Michigan from further water quality deterioration. (Witt-IPC)

EFFECTS OF A NATURAL FISH KILL ON THE WATER QUALITY, PLANKTON, AND FISH POPULATION OF A POND IN THE BIG CYPRESS SWAMP, FLORIDA,
Miami Univ., Coral Gables, Fla. Dept. of Biology.
J. A. Kushlan.
Transactions of the American Fisheries Society, Vol 103, No 2, p 235-243, April 1974. 3 fig, 4 tab, 18 ref.

Descriptors: Runoff, *Fishkill, *Dry seasons, *Water quality, *Water level fluctuations, *Plankton, *Swamps, Ponds, *Florida, Water levels, Low water mark, Oxygen, Aquatic microorganisms, Aquatic animals, Limnology, Surface waters, Water types, Aquatic life, Dissolved oxygen.
Identifiers: Big Cypress Swamp(Fla).

A naturally occurring fish kill took place during the southern Florida dry season of 1970 when receding water levels forced aquatic organisms out of shallow swamps and into a small pond. Physicochemical parameters of water quality varied greatly from their usual range, as did the abundance of phytoplankton which reached a peak of 2,500,000,000 cells/liter. The fish kill had no effect on the long-term limnological characteristics of the pond, as water quality returned to normal range within 2 months and phytoplankton disappeared within 1 month after the fish kill. The species of fish in the pond showed a range of susceptibility to low oxygen concentration and other aspects of the fish kill. They were classified into three categories based upon their survival: Notemigonus crysoleucas, Lucania goodei, and all centrarchids were eliminated rapidly; Fundulus chrysotus, Peocilia latipinna, Heterandria formosa, and Ictalurus natalis were either eliminated late in the fish kill or survived in numbers lower than measurable by methods used in this study; and Lepisosteus platyrhincus, Gambusia affinis, Jordanella floridae, and the prawn Palaemonetes paludosus survived the fish kill in moderate densities of 0.6 to 6 individuals/sq m. In three species of Lepomis, larger fish died before smaller ones. Six of 22 species of fish and only 0.6% of the previous fish population survived the fish kill. (Witt-IPC)
W74-09448

ON SPENT OF LIQUOR SEMICHEMICAL PULPING. PART III. TOXICITY CHARACTERISTICS OF SCP SPENT LIQUOR AND REDUCTION OF THE TOXICITY (IN JAPANESE),
Kyushu Univ., Fukuoka (Japan). Wood chemistry Lab.
R. Kondo, K. Sameshima, and T. Kondo.
Japan Tappi, Vol 27, No 10, p 476-485, Oct, 1973. 5 fig, 12 tab, 22 ref. English summary.

Descriptors: *Toxicity, *Pulp wastes, *Sulfite liquors, Fish, *Sulfur compounds, Hydrogen sulfide, Suspended solids, Lignins, Carbohydrates, Aeration, Irradiation, Ultraviolet radiation, Resistance, Duration curves, Time, Volatility, Water pollution effects.
Identifiers: Mercaptans, Methyl mercaptan(Methanethiol), Kraft mills, Black liquors, Spent pulping liquors, Neutral sulfite semichemical(NSSC) pulping, Spent sulfite liquors, Xylose, Monosaccharides, *Aplocheilus latipes, *Oryzias latipes.

The median tolerance limits (TLm) and the median survival times (MST) of two fish species (Aplocheilus latipes and Oryzias latipes) after 24 and 48 hr exposures to spent neutral sulfite semichemical (NSSC) pulping liquors were measured as toxicity indicators in comparison to kraft pulp effluents. The 48-hr TLm (in terms of COD) was 2340 ppm for neutralized spent NSSC liquor, compared to 755 ppm for kraft mill wastes, indicating a much lower toxicity for the NSSC effluent. However, this toxicity did not decrease appreciably over a period of several days, whereas that of the kraft effluent decreased daily, probably due to the volatilization of methyl mercaptan and hydrogen sulfide. Neither eaeration nor ultraviolet irradiation decreased the toxicity of the spent NSSC liquor, whereas kraft liquor responded well to such treatments. The difference is attributed to interference of suspended solids with these treatments upon prolonged storage. The stable toxicity of the NSSC liquor is thought to come partly from xylose in the suspended matter. (Brown-IPC)
W74-09454

A BENTHOS SURVEY (1972) IN THE NORTH SASKATCHEWAN RIVER IN THE VICINITY OF THE PRINCE ALBERT PULP COMPANY, PRINCE ALBERT, SASKATCHEWAN,
Department of the Environment, Winnipeg (Manitoba). Fisheries and Marine Service.
L. A. Gregory, and J. S. Loch.
Technical Report Series No. CEN T-73-2, March, 1973, 24 p. 2 fig, 5 tab, 9 ref.

Descriptors: *Water pollution effects, *Pulp wastes, *Water pollution sources, Rivers, *Benthic fauna, Effluents, Waste water(Pollution), Fibers(Plant), Solid wastes, Canada, Discharge(Water), Aquatic environment, Organic loading, Waste water treatment, Treatment facilities.
Identifiers: *Saskatchewan River(Canada), Prince Albert Pulp Co.(Prince Albert, Saskatchewan).

The benthic community in the North Saskatchewan River in the vicinity of a bleached kraft pulp mill was surveyed during August 1972. Substrate analyses showed little organic content and suggested that the mill's primary and secondary effluent treatment processes are effectively removing most of the residual wood fibers. The sand-clay substrate restricted the number of representative benthic general present. Qualitative assessments based on chironomids indicated that some pollution effects existed below the mill's outfall, but the presence of pollutant-sensitive Ephemeroptera, Odonata, and Trichoptera throughout the river stretch examined supported the conclusion that no severe pollution problems are posed by the pulp mill operation. (Witt-IPC)
W74-09459

BENTHOS STUDIES (1971 AND 1972) ON THE WINNIPEG RIVER IN THE VICINITY OF THE ABITIBI MANITOBA PAPER COMPANY, PINE FALLS, MANITOBA,
Department of the Environment, Winnipeg (Manitoba). Fisheries and Marine Service.
L. A. Gregory, and J. S. Loch.
Technical Report No CEN T-73-3, June, 1973, 37 p. 5 fig, 6 tab, 14 ref.

Descriptors: *Water pollution sources, *Water pollution effects, Fibers(Plant), *Pulp wastes, Rivers, *Benthic fauna, *Canada, Effluents, Industrial wastes, Discharge(Water), Waste water(Pollution), Fish hatcheries, Fish, Fish behavior, Aquatic environment, Liquid wastes, Solid wastes, Wood wastes, Toxicity.
Identifiers: *Winnepeg River(Canada), Abitibi Manitoba Paper Co.(Pine Falls, Manitoba), Log booms, Sublethal effects.

Benthic surveys were conducted in the summers of 1971 and 1972 to assess the condition of the Winnipeg River in the neighborhood of Abitibi Manitoba Paper Co.'s integrated newsprint mill. Qualitative and quantitative analyses of the collected data (including diversity indices for aquatic genera) indicated that the benthic community is moderately to severely affected in the vicinity of the mill's effluent outfall, and that heavy to moderate pollution effects extend up to 4 miles downstream. The mill's discharge consists of both liquid and solid wastes (wood fibers), the latter originating also from the log boom. Fiber deposits have been shown in earlier studies to affect the hatching of fish eggs and the survival of fry. Removal of this fiber source would benefit the aquatic community. (Witt-IPC)
W74-09460

THE EFFECTS OF WATER FLOW MANIPULATION BELOW THE HYDROELECTRIC POWER

DAM ON THE BOTTOM FAUNA OF THE UPPER KENNEBEC RIVER, MAINE,
Maine Cooperative Fishery Unit, Orono.
H. M. Trotzky, and R. W. Gregory.
Transactions of the American Fisheries Society, Vol 103, No 2, p 318-324, April, 1974. 3 fig, 2 tab, 9 ref.

Descriptors: *Water level fluctuations, *River flow, *Maine, *Benthic fauna, *Aquatic life, Aquatic insects, Hydroelectric plants, Fluctuations, Impounded waters, Rivers, Water sampling, Dams, Streamflow, Discharge(Water), Hydraulic structures, Engineering structures.
Identifiers: *Kennebec River(Maine), Wyman Dam(Maine).

The effect of severe fluctuations in water flow on the distribution of bottom fauna of the upper Kennebec River was studied. During the years 1964-1970, discharge below Wyman Dam ranged from 8.5 cu m/sec to an average daily high of about 170 cu m/sec. Slow currents resulting from low flows appeared to limit the diversity and abundance of swift-water aquatic insects on the river bottom below the dam. Sampling stations above the impoundment averaged 19 aquatic insect genera, while those below the dam averaged 11. About 19 genera were found at stations where the current near bottom fluctuated from 0.5 m/sec to 0.9 m/sec, while only 4 genera were found at stations where the fluctuations were from 0.1 to 0.5 m/sec. Aquatic insects adapted for swift water, such as Rhyacophila, Chimarra, Iron, Blepharocera, Acroneuria, and Paragnetina, were more abundant above the impoundment than below, and were absent from those stations below the impoundment with the lowest current velocities. (Witt-IPC)
W74-09462

BIOLOGICAL MONITORING OF THE FRASER RIVER NEAR PRINCE GEORGE, B.C.,
Beak (T.W.) Consultants Ltd., Toronto (Ontario).
D. Stone, T. C. Griffing, and M. C. Knight.
Pulp and Paper Magazine of Canada, Vol 75, No C (Convention issue), p 100-106 (Technical Paper T110), March, 1974. 7 fig, 19 ref.

Descriptors: Rivers, *Monitoring, *Fish, *Surveys, *Effluents, Aquatic life, *Canada, Aquatic environment, Water pollution, Water pollution effects, Waste water treatment, Pulp and paper industry, Pulp wastes, Industrial wastes, Water pollution sources, Water analysis, Analytical techniques, Biota, Biological treatment.
Identifiers: Water biology, *Fraser River(B.C.-Canada).

A biological survey was made of the Fraser River near Prince George, British Columbia, before and after startup of 3 kraft pulp and paper mills, for the purpose of determining the possible effects of mill effluent on the biological conditons of the river. The objectives were to document pre-operational baseline conditons and to detect and measure possible mill-induced changes so that corrective measures could be taken if necessary. Biological surveys were conducted twice in 1963, four times in 1964, and annually thereafter through 1970. The original study was sponsored by Prince George Pulp and Paper Company and was joined later by Northwood Pulp Company and by Intercontinental Pulp Company. The survey program is described and salient features of the data, methods of analysis, and conclusions are presented. The general good condition of the river after receiving effluent discharges indicates that the waste treatment systems at the mills are functioning satisfactorily. (Buchanan-IPC)

THE ENVIRONMENTAL IMPACT CONCEPT, AND ITS EFFECT ON THE NATIONAL GAS INDUSTRY,
Southwest Research Inst., San Antonio, Tex.
A. R. Schleicher.
American Gas Association Monthly, Vol 56, No 4, p 21-25, April, 1974.

Descriptors: *Environmental effects, *Natural gas, Evaluations, Federal government, Environmental control.
Identifiers: *Environmental impact statements, *Natural gas industry.

The environmental impact concept and its effect on the natural gas industry are discussed. Organizations are required to evaluate anticipated environmental effects of their actions and decision making processes. A draft of the evaluation must be circulated 90 days prior to the action, and a final statement is due at the Environmental Protection Agency 30 days before the action is scheduled. Practically all sectors of the gas industry are being effected by the new requirements. Producers may encounter federal requirements for environmental reports when operations involve federal or Indian lands, or offshore locations. Segments of the industry involved in gas transmission are acutely aware of the influence of environmental questions, since most of their construction activities involve federal authorization. Most companies involved in the environmental impact process find it necessary to seek the aid of outside consultants. But, decision makers in the natural gas industry should develop their own practical appreciation of the scope and intent of current environmental policies and the way the system works. (Merritt-FIRL)
W74-09489

CADMIUM TOXICITY AND BIOCENTRATION IN LARGEMOUTH BASS AND BLUEGILL,
Oklahoma Univ. Health Sciences Center, Oklahoma City. Dept. of Environmental Health.
J. E. Cearley, and R. L. Coleman.
Bulletin of Environmental Contamination and Toxicology, Vol 11, No 2, p 146-151, 1974. 4 fig, 7 ref.

Descriptors: *Cadmium, *Bass, *Sunfishes, Animal behavior, Animal growth, Growth rates, Environmental effects, Animal diseases, Investigations, Evaluations, *Water pollution effects, Water analysis, *Toxicity.
Identifiers: Accumulation, Nervous system, Exposure.

The effects of subacute exposure to cadmium in the largemouth bass and bluegill were evaluated based on observations of behavioral effects, rate of growth, survival, and tissue and organ accumulation of cadmium. Exposure to cadmium in concentrations ranging from 0.0005 to 0.85 mg/liter resulted in accumulation of the metal in concentrations greater than those of the water. The quantity of metal accumulated increased as the exposure concentration increased. An equilibrium developed between the concentrations of the metal in the water and in the tissues after approximately 2 months. Metal accumulations on the bass tissues were higher in the internal organs, followed by the gills and the remainder of the body. The bass were more sensitive to cadmium than the bluegill. Abnormal behavior patterns observed in both species suggested that the nervous system was the site of damage. (Merritt - FIRL)

NUTRIENTS AND AQUATIC VEGETATION EFFECTS,
New York State Dept. of Health, Albany. Div. of Labs. and Research.
G. W. Fuhs.
Journal of the Environmental Engineering Division, American Society of Civil Engineers Vol 100, No EE2, p 269-278, April, 1974. 1 tab, 14 ref.

Descriptors: *Eutrophication, *Ecosystems, *Nutrient removal, *Phosphorus, Aquatic life, Streams, Rivers, Reservoirs, Water pollution sources, Water pollution control, Land use, Surface runoff, Nitrogen, Productivity, Soils.
Identifiers: *Nutrient pollution.

The effect of nutrient pollution and nutrient removal on aquatic ecosystems is discussed. Because the increase in productivity of streams and rivers is difficult to control, measures to control eutrophication of inland lakes and reservoirs must center around control of total phosphorus loadings. To the extent that excessive phosphorus loadings are in part or totally due to discharges from point sources, these sources must be controlled. In many lakes, however, inputs from natural and other nonpoint sources are significant. Such inputs must be determined as a basis for evaluating total control needs with respect to projected best usage and, in consequence, the desirability and feasibility of control of nonpoint sources and land use. It is hoped that continued studies of land runoff will soon provide an overall view of phosphorus runoff from natural sources, so that runoff numbers will be available for most watersheds of New York State and other areas of the United States. The control of eutrophication in coastal waters requires the control of nitrogen discharges. (Merritt - FIRL)

Helminthologia (Bratisl). 10. p 83-91. 1969.
Identifiers: Amphibians, Control, *Fasciola hepatica, Fascioliasis, Fish, *Frescon, Leech, *Lymnaea-truncatula, *Molluscicides, Morpholine, Toxicity.

The molluscicide N-tritylmorpholine (Frescon shows promise for the control of Lymnaea truncatula, snail host of Fasciola hepatica. N-Trityl morpholine is very effective against L. truncatula when sprayed on pastures in dosages within the range 0.25-0.5 kg/ha. It has no effect on plants and no known biological activity against terrestria animals of any kind. Various species of aquatic snails, leeches, fish and amphibians may be affected. The molluscicide may be applied with a variety of equipment including knapsack sprayers tractor-mounted sprayers and aircraft. Provided that the soil is wet and vegetation does not impede penetration to soil level the volume of spray liquid has no influence on effectiveness. The relative merits of spring and autumn applications with N tritylmorpholine are discussed. Autumn treatment is generally aimed at preventing losses due to outbreaks of acute fascioliasis and depends on system of forecasting outbreaks of outbreaks of disease. Routine spring treatment of snail habitat may be preferred to limit the prevalence of chronic liasis. N-Tritylmorpholine should be applied when the soil is wet and likely to remain so. Penetration is best achieved when the grass is short. Such conditions predictably occur in the spring but may also occur in the autumn, especially following wet summers.--Copyright 1973 Biological Abstracts, Inc.

BACTERIOLOGICAL WATER QUALITY AND INCIDENCE OF WATERBORNE DISEASES IN A RURAL POPULATION,
S. N. Medical Coll., Agra (India).
B. K. Trivedi, H. S. Gandhi, and N. K. Shukla.
Indian J Med Sci, 25(11): 795-801, 1971.
Identifiers: *Bacteriological studies, Chlorination, Dysentery, Enteritis, Human disease, *India(Kanpur), Rural populations, *Water quality, *Water-Borne diseases, *Water wells.

The incidence of waterborne diseases in 48 wells in 3 villages in Kanpur (India) was reported. The relationship between the bacteriological quality of drinking water and the effect of chlorination wi

observed. Chlorination with 0.5 ppm of residual chlorine was best in reducing bacteriological contents of well water. Of 162 human cases of waterborne diseases, the majority were of gastroenteritis followed by dysentery. The incidence of waterborne diseases was compared for the control group and those served by the experimental wells. Chlorination reduced the incidence of waterborne diseases in the experimental wells when compared to the same period in previous yr.--Copyright 1973, Biological Abstracts, Inc.

HEALTH EFFECTS OF ENVIRONMENTAL POLLUTANTS,
G. L. Waldbott.
C. V. Mosby Company, Saint Louis, Missouri. 1973. 316 p.

Descriptors: *Air pollution effects, *Diseases, *Pollutants, *Public health, Air pollution, Human diseases.
Identifiers: *Environmental pollutants, *Health effects.

The health effects of air-born pollutants are examined, and they are classified according to their specific effect on the human body. Much of the data used in making these correlations has been obtained from animal experiments and occupational exposures to high concentrations. Part I considers the sources and action of the various pollutants, and the body's defenses against the pollutants. Part II considers the specific health effects of the various pollutants and classifies them into the following agents: (1) fibrosis-producing agents, (2) granuloma-producing agents, (3) fever-producing agents, (4) asphyxiating pollutants, (5) systemic poisons, (6) allergenic agents, (7) carcinogens, and (8) mutagenic pollutants. Part III, entitled Special Situations, considers the effects of economic poisons, hydrocarbons, radioactive substances, smoking, water pollution, and fires. Part III also contains a chapter dealing with the prophylaxis and treatment of diseases caused by air pollution. (Martino-NWWA)

NORTHWEST FISHERY CENTER RESEARCH ON EFFECTS OF ENVIRONMENTAL CONTAMINANTS ON MARINE ORGANISMS,
National Marine Fisheries Service, Seattle, Wash. Northwest Fisheries Center. Environmental Conservation Division.
M. E. Stansby, and D. L. Alverson.
Marine Fisheries Review, Vol 35, Nos 5-6, p 8-14, 1973. 7 photos.

Descriptors: *Research and development, *Contaminants, *Marine fish, *Water pollution effects, Analytical techniques, Marine plants, Industrial wastes, Oil, Heavy metals, Pesticides.

Associated with many previous investigations by other researchers has been the erroneous overt or inadvertent implication that when the amounts of contaminants in fish (such as DDT and mercury) exceed the level deemed safe for human consumption, the contaminants must be doing harmful things to the animals themselves. The aim of the program at the Northwest Fishery Center is to assess the physiological or biochemical damage resulting from different levels of contaminants which may be incorporated through various mechanisms into marine organisms. New studies initiated at the NWFC will employ contaminants presented to fish in their feed at levels comparable to those encountered by fish in their natural environment. The contaminants to be studied will include the pesticide endosulfan, PCB's, and petroleum oil components. The investigation into the effects of contaminants upon fish will involve a three-pronged attack: (1) biochemical investigations looking into pathways within the fish of contaminants, (2) physiological studies aimed at determining the effects of environmental alterations and contaminants on marine and anadromous species, (3) field research operations which conduct practical tests in the natural environment based upon laboratory findings. EXCRETION AND ABSORPTION OF METHYL MERCURY AFTER POLYTHIOL RESIN TREATMENT,
Rochester Univ. Medical Center, N.Y. Dept. of Radiation Biology and Biophysics.
T. W. Clarkson, H. Small, and T. Norseth.
Archives of Environmental Health, Vol 26, No 4, p 173-176, April 1973. 2 fig, 1 tab, 12 ref.

Descriptors: *Mercury, *Laboratory tests, *Rodents, Movement, Toxins, Inorganic compounds, Laboratory animals, Foods, Testing procedures, Public health, *Absorption.
Identifiers: *Methyl mercury.

Results are reported of feeding to mice a polystyrene resin containing fixed sulfhydryl groups. Test involved the effects of the resin on the rate of excretion of methyl mercury and also on the gastrointestinal absorption of methyl mercury compounds in food. A synthetic polythiol resin when added to food at a concentration of 1% doubled the rate of excretion of mercury from mice given a simple dose of methyl mercuric chloride. After 42 days of resin treatment the levels of mercury in blood, brain, kidney, and liver had been reduced by factors of 7.2, 6.0, 7.2, and 10.0, respectively, as compared with those in untreated animals. The resin also reduced by 50% the rate of absorption of methyl mercury compounds from food. (Jernigan-Vanderbilt)

BONE CHANGES IN EXPERIMENTAL CHRONIC CADMIUM POISONING, RADIOLOGICAL AND BIOLOGICAL APPROACHES,
Kyoto Univ., (Japan). Dept. of Hygiene.
Y. Itokawa, T. Abe, and S. Tanka.
Archives of Environmental Health, Vol 26, p 241-244, May 1973. 3 fig, 3 tab, 9 ref.

Descriptors: *Cadmium, *Laboratory tests, *Rodents, Industrial wastes, Laboratory animals, Human diseases, Public health, Toxicity, Diets, Growth rates.
Identifiers: Calcium deficiency, Bone damage.

The following experiments were undertaken to test the hypothesis that calcium deficiency coupled with cadmium poisoning is responsible for Itai Itai disease. To clarify the relationship between chronic cadmium poisoning and bone abnormalities, male Wistar rats were separated into eight groups given eight different synthetic diets. After four weeks of these dietary regimens the rats were killed and examined roentgenographically. Muscles and bones were removed and analyzed for cadmium, calcium, magnesium, and zinc. The most remarkable x-ray finding was the abnormal curvature of the spinal column. Cervicodorsal lordosis and dorsolumbar kyphosis as well as scoliosis increased markedly in rats fed a low-protein, calcium-deficient, and cadmium-added diet. Cadmium levels increased and magnesium and zinc levels decreased in bones of cadmium-dosed groups. Calcium levels in red muscle (soleus) and white muscle (gastrocnemius) were significantly elevated in rats on a low-protein, calcium-deficient, and cadmium-added diet. (Jernigan-Vanderbilt)

BRAIN ALUMINUM DISTRIBUTION IN ALZHEIMER'S DISEASE AND EXPERIMENTAL NEUROFIBRILLARY DEGENERATION,
Toronto Univ. (Ontario). Dept. of Physiology.
D. R. Crapper, S. S. Krishnan, and A. J. Dalton.
Science, Vol 180, p 511-513, May 1973. 1 tab, 8 ref.

Descriptors: *Aluminum, *Human pathology, *Animal pathology, Human diseases, *Toxicity, Public health, Laboratory animals, Laboratory tests, Analytical techniques, Spectroscopy, Industrial wastes.
Identifiers: *Alzheimer's disease, *Felines.

In the early stages of an aluminum chloride-induced encephalopathy in cats, an apparently selective impairment in short-term memory and associative learning preceded the appearance of focal neurological signs. The decline in higher nervous functions resembled in part those noted in the human conditions of presenile and senile demention of the Alzheimer type. A study of the aluminum concentration in the brain of cats with acquisition defects was undertaken in order to establish the tissue concentration at which morphological and behavioral changes occurred. In addition, the aluminum content of the brain was determined in humans with Alzheimer's disease. The variation in aluminum concentration in cortical regions is noteworth in relation to the characteristic pathological finding in Alzheimer's disease of the patchy distribution of neurofibrillary degeneration (NFD). The density of NFD in the experimental model is often very much higher than that encountered in Alzheimer's disease. Nevertheless, the surprisingly high tissue concentration of 9 to 11 micrograms/g in some regions of brain in Alzheimer's disease, compared to the average values of 14 micrograms/g in cat brain with experimental NFD, suggests that aluminum may be a neurotoxic factor in the human disease. LIMNOLOGICAL STUDIES OF LAKE JACOMO, JACKSON COUNTY, MISSOURI. II. THE DYNAMICS OF THE MACROBENTHOS AND ITS RELATIONSHIP TO WATER QUALITY AND PLANKTON DISTRIBUTION IN

LAKES JACOMO AND PRAIRIE LEE, WITH A NOTE ON THE SPORT FISHERY, 1971-1972,
Missouri Univ., Kansas City. Dept. of Biology.
M. S. Stern, and D. H. Stern.
Available from the National Technical Information Service as PB-233 691, $4.00 in paper copy, $1.45 in microfiche. Missouri Water Resources Research Center, Columbia, Completion Report, June 1974. 75 p, 22 fig, 7 tab, 29 ref. OWRR A-052-MO(1). 14-31-0001-3525.

Descriptors: *Benthos, Aquatic insects, Algae, *Plankton, *Water quality, Recreation, *Eutrophication, Sport fishery, *Missouri, Lakes, Nutrients, *Mollusks, *Cyanophyta, Sunfishes, Phosphates, *Diptera.
Identifiers: *Lake Jacomo(Mo), Nitrate nitrogen, Prairie Lee Lake(Mo), Aphanizomenon flos-aquae, Musculium truncatum.

The macrobenthos and its relationship to the plankton and water quality were studied for a year in two adjacent recreational reservoirs, Lakes Jacomo and Prairie Lee. These primary recreational waters for metropolitan Kansas City, with more than 2 million visits annually, have been culturally eutrophicated. Both lake shorelines are dissected, and the watershed and privately owned shoreline areas of Prairie Lee Lake provide nutrients that promote nuisance Cyanophyta blooms in both lakes. Nitrate nitrogen mean concentrations ranged from 0.05-0.50 ppm, while those for orthophosphate ranged from 0.04-0.24 ppm. There were 74 macrobenthic and 151 plankton taxa collected. Insects, primarily Diptera, dominated the macrobenthos in Lake Jacomo, while molluscs were dominant in Prairie Lee Lake. The maximum standing crops were 1952/sq. ft. in Lake Jacomo in October and 4256/sq. ft. in Prairie Lee Lake in December. Diptera comprised 59% of the total macrobenthos in Lake Jacomo, while molluscs, mostly Musculium truncatum, made up 76% of it in Prairie Lee Lake. Cyanophyta, particularly Aphanizomenon flos-aquae, dominated the plankton for the second successive year. The sport fishery in Lake Jacomo has been decreasingly dominated by bluegill. The mean catch per angler over a five-year period was 1.5 fishes, and the mean catch per hour was 0.58 fish. (See also W72-10431)

SIFE CONCENTRATION AND SPECIFIC ACTIVITIES IN NORTH PACIFIC MARINE ORGANISMS,
Battelle-Pacific Northwest Lab., Richland, Wash.
C. E. Jenkins, and J. C. Langford.
IEEE Transactions on Nuclear Science, Vol NS-21, No 1, p 517-521, February, 1974. 8 fig, 16 ref.

Descriptors: Iron, *Salmon, Marine fish, Sea water, *Pacific Ocean, *Alaska, Food chains, *Radionuclides, Investigations, Aquatic environment, Environmental effects.
Identifiers: *Iron-55.

Marine organisms have been shown to have up to 1600-fold higher specific activities of iron-55 than that in seawater; also iron-55 specific activities increase 10 to 30-fold in salmon between mid and northern latitudes. These observations are currently explained on the basis of a different chemical form for iron-55 in seawater and greater dilution of the iron-55 by stable iron at mid-latitudes than at the northern latitudes. The half-time for iron-55 concentrations in mature harvested salmon at all latitudes is approximately 10 months, which is comparable to the half-time for movement of stratospheric debris to the earth's surface. Archives of Environmental Health, Vol 27, No 1, p 45-47, July 1973. 1 fig, 4 tab, 7 ref.

Descriptors: *Cadmium, *Sewage sludge, *Environmental sanitation, *Crop production, *Wheat, Industrial wastes, Analytical techniques, Testing procedures, Effluents, Nutrients, Sludge disposal, *Neutron activation analysis, Spectroscopy, Pollutant identification.

Wheat has been grown in tests pots at four different sewage sludge concentrations and three different pH levels in order to study the cadmium uptake from sewage sludge. The sludge contained 10 parts per million (ppm) cadmium, which is below the average cadmium concentration in sludge from Swedish sewage sludge plants. The analysis of cadmium in wheat has been performed by two methods, atomic absorption and neutron activation analysis, and good agreement was found between results from the methods. The results show that the cadmium uptake increases strongly with increasing sewage sludge concentrations. It can be concluded beyond any doubt that cadmium from sewage sludge used as a plant nutrient source is resorbed by plants. The pH of the soils was found to be of great importance for the uptake of cadmium. Lower pH gave greater cadmium uptake. (Jernigan-Vanderbilt)

LEAD AND VITAMIN EFFECTS ON HEME SYNTHESIS,
Illinois University, Urbana. Dept. of Animal Science.
R. L. C. Kao, and R. M. Forbes.
Archives of Environmental Health, Vol 27, No 1, p 31-35, July 1973. 2 fig, 5 tab, 54 ref.

Descriptors: *Lead, *Vitamins, *Toxicity, *Rodents, Laboratory tests, Laboratory animals, Testing procedures, Heavy metals, Animal metabolism.
Identifiers: Vitamin B12, Ascorbic acid, *Heme synthesis.

When a purified diet was supplemented with 300 ppm lead as the acetate and was fed to weanling rats, significant decreases in feed intake, weight gain, and blood heme were observed. In vitro heme synthesis in blood from these lead-treated animals was increased by a single injection of niacin or vitamins C + B12; pyridoxine, thiamine, or riboflavin had no effect. Exposure to diet lead concentrations of 50, 150, and 300 ppm produced a significant and graded increase of urinary delta-aminolevulinic acid (ALA) within 18 hours, followed by a gradual decrease. A tenfold dietary excess of niacin provided no significant protection against toxic reactions from lead in terms of in vivo blood heme levels, in vitro heme synthesis, or urinary ALA. (Jernigan-Vanderbilt)

LEAD CONCENTRATION FOUND IN HUMAN BLOOD IN ASSOCIATION WITH LEAD COLIC,
Yugoslav Academy of Sciences and Arts, Zabreb. Inst. for Medical Research.
T. Beritic.
Archives of Environmental Health, Vol 23, No 4, p 289-291, October 1971. 1 tab, 1 ref.

Descriptors: Lead, *Human pathology, *Analytical techniques, Industrial wastes, Absorption, Toxicity.
Identifiers: *Lead colic, *Yugoslavia.

Results discussed of a study of 64 patients suffering from lead intoxication. The diagnosis of lead colic was based upon the existence of severe attacks of spasmodic abdominal pain preceded, accompanied, or followed, invariably, by obstinate constipation. In some of the most severe cases of lead poisoning the levels of concentration of lead in the blood were found to be remarkedly low. Blood was drawn from all subjects for lead analysis before any therapeutic measures were undertaken, and the specimens analyzed in parallel by a modification of the dithizone method. Specimens analyzed by this method are deemed to be abnormal when the concentration of lead is in excess of 70 micrograms/100 ml. For 13 of the 64 patients, levels ranged from somewhat less than 40 micrograms/100 ml to just 80 micrograms/100 ml. It is concluded that the finding of a low level of lead content in the blood, of itself, is not always a proper basis for the diagnostic exclusion of lead intoxication. (Jernigan-Vanderbilt)

REDUCTION IN MERCURY CONTENT OF FISH PROTEIN CONCENTRATE BY ENZYMATIC DIGESTION,
Massachusetts Inst. of Tech., Cambridge. Dept. of Nutrition and Food Science.
M. C. Archer, B. R. Stillings, S. R. Tannenbaum, and D. I. C. Wang.
Agricultural and Food Chemistry, Vol 21, No 6, p 1116, November/December 1973. 1 tab, 10 ref.

Descriptors: *Mercury, *Fish, *Proteins, *Enzymes, Laboratory tests, Analytical techniques, Spectroscopy, Food processing industry, Heavy metals.
Identifiers: *Enzymatic digestion, Proteolysis.

During the processing of fish into FPC (fish protein concentrate) by isopropyl alcohol extraction, the protein is concentrated by a factor of 4-6, with a corresponding fivefold enhancement of mercury concentration. This indicates that little or no mercury is extracted from fish during concentrate manufacture. The amount of mercury can be reduced in FPC by proteolytic digestion. A two- to sevenfold concentration of mercury in the insoluble FPC fraction and corresponding reduction in mercury level in the soluble FPC fraction was achieved after proteolysis. In 1 hr roughly 90% of the mercury remained in the insoluble fraction whereas only 10% was in the soluble product; after 6 hr, roughly 80% of the mercury was found in the insoluble fraction and 20% in the soluble product. The concentrations of mercury in the enzyme-resistant fraction may mean that either the mercury is bound to an extremely enzyme-resistant fraction or the presence of mercury in the protein lends the property of enzyme resistance. On the basis of these results, the biological availability of Hg is about 20%, assuming that the insoluble fraction passes the gut unabsorbed. (Jernigan-Vanderbilt)

BERYLLIUM-INDUCED ULTRASTRUCTURAL CHANGES IN INTACT AND REGENERATING LIVER,
Pittsburgh Univ., Pa. Dept. of Pathology.
P. J. Goldblatt, M. W. Lieberman, and H. Witschi.

Archives of Environmental Health, Vol 26, p 48-56, January 1973. 12 fig, 1 tab, 44 ref.

Descriptors: *Beryllium, *Laboratory tests, *Laboratory animals, *Human diseases, Toxicity, Public health, Rodents, Animal pathology, Cytological studies, Heavy metals.
Identifiers: Liver necrosis, Cancer, *DNA.

A light and electron microscopic examination of resting and regenerating liver was undertaken to further document the subcellular effects of the Be compounds and provide structural correlates for the growing body of biochemical observations. Intact or partially hepatectomized male rates were given intravenous aqueous BeSO4-4H2O. Light microscope studies of partially hepatectomized animals examined at 6, 12, 24, and 48 hours after injections of 15, 30, or 60 micromals BeSO4 per kilogram or given 30 micromols BeSO4 per kilogram 8, 12, and 22 hours after partial hepatectomy and killed at 28 hours, revealed liver necrosis in animals surviving 48 hours, and abolition of mitoses in animals treated 16 or 20 hours before death. Ultrastructural alterations in both intact and partially hepatectomized animals examined 24 hours following Be injection included vacuolization and dense deposits in lysosomes, loss of fibrils and appearance of dense plaques in some nucleoli, and distoration of bile canaliculi. The lysosomal changes and inhibition of mitosis correlate well with previous biochemical studies. The exact mechanism by which Be induces inhibition of DNA synthesis and hepatic necrosis remains to be elucidated by further studies. (Jernigan-Vanderbilt)

GASTROINTESTINAL ABSORPTION OF DIFFERENT COMPOUNDS OF 115M CADMIUM AND THE EFFECT OF DIFFERENT CONCENTRATIONS IN THE RAT,
National Environmental Research Center, Cincinnati, Ohio. Environmental Toxicology Research Div.
J. Moore, Jr., J. F. Stara, and W. C. Crocker.
Environmental Research, Vol 6, p 159-164, 1973. 2 fig, 2 tab, 9 ref.

Descriptors: *Cadmium, *Toxins, *Laboratory tests, *Rodents, Public health, Laboratory animals, Testing procedures, Distribution patterns, Absorption, Animal metabolism.
Identifiers: Dosage.

The effect, if any, of different chemical compounds of 115m cadmium upon gastrointestinal absorption, retention, and tissue distribution and the effect of different concentrations of cadmium upon absorption were studied in female rats. After single oral dose, the chloride, sulfate, and citrate forms of 115m Cd did not significantly influence the absorption, retention, or distribution of the 115m Cd in the tissues. The only organs containing significant amounts of 115m Cd were the liver, kidney, and gastrointestinal tract. Increases in concentration of cadmium resulted in more cadmium being absorbed from the gastrointestinal tract, although the amount absorbed was not proportional to the increase in concentration. The results showed that only 3-5% of a given oral dose of the cadmium compounds tested is absorbed with considerable variation among animals. Cadmium absorption was increased considerably by low intake of calcium and protein in animals; it appears that a similar effect would occur in man. (Jernigan-Vanderbilt)

CADMIUM, NICKEL, LEAD, AND ZINC IN EARTHWORMS FROM ROADSIDE SOIL,
Bureau of Sport Fisheries and Wildlife, Washington, D.C. Div. of Wildlife Refuges.
C. D. Gish, and R. E. Christensen.
Environmental Science and Technology, Vol 7, No 11, p 1060-1062, November 1973. 2 tab, 16 ref.

Descriptors: *Cadmium, *Lead, *Zinc, *Soil contamination, *Annelids, Nickel, Toxicity, Air pollution, Path of pollutants, Public health, Heavy metals, Measurement.
Identifiers: *Automobile emissions, *Soil organisms.

Cd, Ni, Pb, and Zn in soils and earthworms along two Maryland highways decreased with increasing distance (10, 20, 40, 80, and 160 ft) from the roadway. Metals were quantified by atomic absorption spectrophotometry. Metal residues were higher at the location along each highway where traffic volume was greater. Correlations between residues in earthworms and soil decreased with decreasing atomic weights (Pb > Cd > Zn > Ni). Metal residues in soils were positively correlated with quantities of soil organic matter. Earthworms accumulated up to 331.4 ppm of Pb and 670.0 of Zn, concentrations which may be lethal to earthworm-eating animals. (Jernigan-Vanderbilt)
W74-09780

ZINC AND CADMIUM IN NORMAL HUMAN EMBRYOS AND FETUSES, ANALYSES BY ATOMIC ABSORPTION SPECTROPHOTOMETRY,
Inst. of Rehabilitation Medicine. Univ. Medical Center, N.Y.
S. Chaube, H. Nishimura, and C. A. Swinyard.
Archives of Environmental Health, Vol 26, No 5, p 237-240, May 1973. 2 tab, 46 ref.

Descriptors: *Cadmium, *Zinc, *Laboratory tests, *Human pathology, *Distribution, Toxicity, Industrial wastes, Spectrophotometry, *Pollutant identification.
Identifiers: Atomic absorption spectroscopy.

Zinc and cadmium concentration in 51 intact normal human embryos and fetal organs derived from abortuses ranging in ages from 31 to 261 days of gestation were determined by atomic absorption spectroscopy. The concentrations of zinc and cadmium were studied with reference to age, sex, and stage of development. Specimens studied were 36 first trimester intact human embryos and liver, brain, and kidney of 14 second and 1 third trimester fetuses. Zinc was found in all first trimester specimens. It increased sevenfold between the 31st and 35th day of gestation. Cadmium was present in 57% of specimens in concentrations from 0.032 micro-g/gm to 0.07 micro-g/gm of wet tissue. In second trimester specimens, mean zinc concentration in the brain was 5.6 micrograms, in kidney 15.7 micrograms, and in the liver 167.7 micrograms. Cadmium was present in 80% of livers (mean, 0.113 micro-g/gm), 28% of kidneys (mean, 0.05 micro-g/gm), and 17% of brain specimens (mean, 0.140 micro-g/gm). Mothers of these abortuses did not live in areas of Japan where endemic cadmium poisoning exists; however, higher cadmium content of the average Japanese diet may be reflected by cadmium concentration in these specimens. (Jernigan-Vanderbilt)
W74-09785

NICKEL CARBONYL POISONING, REPORT OF A FATAL CASE,
Pasadena Bayshore Hospital, Tex.
C. C. Jones.
Archives of Environmental Health, Vol 26, No 5, p 245-248, May 1973. 1 tab, 13 ref.

Descriptors: *Nickel, *Toxicity, *Industrial wastes, *Air pollution effects, Inorganic compounds, Public health, Human pathology, *Lethal limit.

Nickel carbonyl (Ni(CO)4) used as a catalyst in the petroleum, plastic, and rubber industries, is by far the most toxic nickel compound encountered in industry, comparable to hydrogen cyanide gas. The maximum permissible concentration of vapor in air (for 8 hours) is 0.001 ppm. In many cases of accidental poisoning nickel carbonyl was not recognized as the offending agent until several days after exposure. Initial and delayed symptoms are described. Fatalities usually occur between the 4th and 11th days after exposure. Death is usually due to pulmonary and cerebral edema. The urine and the lungs are areas where nickel carbonyl is most easily detected. A fatal case of poisoning is described. In the past, various treatments of nickel carbonyl poisoning with edetic acid, dimercaprol (BAL in oil), penicillamine, and more than 20 alkyl dithiocarbamates have been tried. Of these, diethyldithiocarbamate has proven to be effective as well as the least toxic. It is free of the protracted undesirable side effects of either dimercaprol or penicillamine. (Jernigan-Vanderbilt)
W74-09786

GRANULES CONTAINING LEAD IN ISOLATED MITOCHONDRIA,
John Curtin School of Medical Research, Canberra (Australia). Dept. of Experimental Pathology.
J. R. Walton.
Nature, Vol 243, No 5402, p 100-101, May 11, 1973. 1 fig, 9 ref.

Descriptors: *Lead, *Laboratory tests, *Cytological studies, Calcium, Microbiology, Metabolism, Biochemistry, Heavy metals.
Identifiers: *Mitochondria.

Lead is accumulated in granules produced in isolated rat liver mitochondria following incubation in a lead-containing medium. The computed levels of free lead ion in the media ranged from 0.2 micromol to 100 micromol; by comparison, total plasma lead levels of up to 8 micromol have been found in victims of lead poisoning. Mitochondria were isolated with as little disruption as possible. Controls were incubated at 37 C for 30 minutes in calcium-free medium. The experimental samples were incubated in the same medium with the addition of 1 mM lead nitrate and 1.5 mM NTA. When metabolic inhibitors which operate at different points in energy pathways were added to the medium containing lead, granules were smaller and fewer. These results imply that mitochondrial uptake is a process dependent on energy. Further incubation with DNP yielded dispersal of Ca granules while the lead granules seemed to be unaffected, indicating that lead removal is a less readily reversible process. Therefore, if mitochondria accumulate lead in clinical lead poisoning as they do calcium under normal conditions, the subsequent removal of lead from the mitochondria would be physiologically difficult and excessive accumulation of lead cations would disrupt the ability of the cell to maintain itself metabolically and structurally. (Jernigan-Vanderbilt)

Descriptors: *Genetics, *Plant breeding, *Zinc, *Lead, Fertility, Pollen, Reproduction, Plant physiology, Aquatic plants.
Identifiers: *Outbreeding, *Inbreeding, *Armeria maritima.

Previous studies have shown that self-fertility occurs in zinc-lead mine populations of normally incompatible plant species. In Armeria self-fertility has been assumed to be a mechanism enabling a reliable production of seeds in colonizing situations where individuals are both few and sparse. Inbreeding was artificially induced by enclosing inflorescences in paper bags. While this method did supply data on potential self-fertility, it did not give any idea about the efficacy of self-fertility in the mine population. Selfing obtained by artificial means can disappear in natural conditions. Through studying outbreeding estimates for a population of Armeria collected from a mine site in Belgium and carrying out progeny tests on three samples of the population to estimate the outbreeding coefficient according to the method of Vasek, there was evidence that inbreeding was not occurring in the population. Oubreeding is concluded to be complete at the present time in the mine population although some potential self-fertility has been shown artificially. (Jernigan-Vanderbilt)

HAND TREMOR INDUCED BY INDUSTRIAL EXPOSURE TO INORGANIC MERCURY,
Rochester Univ., N.Y. Dept. of Psychology.
R. W. Wood, A. B. Weiss, and B. Weiss.
Archives of Environemental Health, Vol 26, No 5, p 249-252, May 1973. 5 fig, 17 ref.

Descriptors: *Mercury, *Public health, *Industrial wastes, Inorganic compounds, Human pathology, Laboratory tests.

Individuals with long term exposure to substantial concentrations of metallic mercury vapor may display a number of symptoms including tremor, hesitancy and slurring of speech, blurred vision, and a central nervous system syndrome termed erethism. This study deals exclusively with hand tremor. Hand tremor induced by industrial exposure to inorganic mercury vapor was studied during recovery in two women patients. The subjects were instructed to maintain a force with the forefinger between two limits (10 to 40 gm). Performance progressively improved after cessation of exposure, and patients were asymptomatic in about 3.5 months. The dispersion of the amplitude distribution decreased and percent time within the specified limits increased. Power spectral analysis revealed a marked reduction in power associated with a change in the shape of the spectra. These changes were associated with a reduction in plasma levels of mercury. Graphs are included to illustrate findings which support the notion of a direct relationship between body burden of mercury and tremor severity. (Jernigan-Vanderbilt)

RELATION OF TRACE METALS TO HUMAN HEALTH,
Dartmouth Coll., Hanover, N.H. Dept. of Physiology.
H. A. Schroeder, and D. K. Darrow.
Environmental Affairs, Vol 2, No 1, p 222-236, Spring 1972. 50 ref.

Descriptors: *Metals, *Public health, *Human pathology, *Rodents, *Toxins, Laboratory tests, Lead, Mercury, Cadmium, Chromium, Beryllium, Reviews, Trace elements.
Identifiers: *Trace metals.

The effects of various trace elements on human health are reviewed in the light of annual industrial consumptions, natural abundances and changes in experimental animals fed low doses for life. A laboratory constructed of wood, covered with plastic varnish, on a remote Vermont hilltop was designed to exclude contaminating metals from air and water. Large numbers of rats and mice were exposed to single elements in low doses for a lifetime. Recondite toxicity was evaluated in terms of growth, life span, longevity, changes in serum tumors, microscopic pathology, disease, reproduction and tissue content of each of the 30 elements fed. Little or no subtle toxicity was shown by several metals. Toxic metals (lead, cadmium, nickel, antimony, beryllium, and mercury) and slightly toxic metals are discussed as to sources and effects. Fourteen metals and two nonmetals are essential for life or health of mammals. (Jernigan-Vanderbilt)
W74-09790

OCCUPATIONAL EXPOSURE TO MERCURY VAPORS AND BIOLOGICAL ACTION,
Louvain Univ. (Belgium). Unite de Toxicologie Industrielle et Medicale.
R. R. Lauwerys, and J. P. Buchet.
Archives of Environmental Health, Vol 27, No 2, p 65-68, August 1973. 5 tab, 24 ref.

Descriptors: *Mercury, *Toxicity, *Public health, *Metabolism, Human pathology, Analytical techniques, Testing procedures, Effects, Industries.
Identifiers: *Threshold limit value, Occupational exposure.

The purpose was to investigate whether biological manifestations could be detected in apparently healthy workers who for a few years ave been moderately exposed to mercury vapors. There is no international agreement yet in regard to the airborne concentration of mercury to which workers can be exposed during their working life without deleterious effect on their health. In the U.S., the threshold limit value (TLV) was recently reduced from 0.100 mg/cu m to 0.050 mg/cu m, while in the U.S.S.R. the permissible concentration of mercury vapor in air is only 0.010 mg/cu m. The following biological changes in workers exposed to airborne metallic mercury were detected: increased blood and urine mercury concentrations, increased plasma galactosidase and plasma catalase activities, decreased red blood cell cholinesterase activity. There is no indication that these slight biological changes have any health significance, however. A significant correlation was found between airborne mercury level and urinary mercury concentration (r=0.47), between mercury concentration in blood and in urine (r=0.36), and between airborne mercury concentration and RBC cholinesterase inhibition (r=0.33). 5D. Waste Treatment Processes

CONCEPTUAL DESIGN EVALUATION OF A PHYSICAL-CHEMICAL DOMESTIC WASTE TREATMENT SYSTEM UTILIZING POWER PLANT WASTE HEAT,
Arizona Univ., Tucson. Dept. of Nuclear Engineering.
R. A. Fazzolare, and R. A. Sierka.
Available from the National Technical Information Service as PB-233 440, $3.00 in paper copy, $1.45 in microfiche. Completion Report, June 1974. 16 p, 6 fig, 5 ref. OWRR A-044-ARIZ(4). 14-31-0001-4003.

Descriptors: *Waste water treatment, *Sewage treatment, *Reclaimed water, *Nuclear power plant, Cooling water, Thermal pollution, Heated water, *Domestic water, *Design.
Identifiers: Heated sewage.

The use of power-plant heat in a physical-chemical domestic wastewater renovation system has been the subject of a three-year investigation in order to explore the feasibility of the concept. In this work conceptual process engineering designs are evaluated and further laboratory experiments are reported. Laboratory tests and preliminary engineering examinations reveal that the commercial exploitation of the concept of combining a wastewater treatment facility to a power plant, using the waste heat to enhance physical-chemical treatment and generating renovated water for condenser cooling, is a viable concept. Pilot plant studies are considered necessary for further engineering evaluations, and a pilot plant design is proposed.

APPLICATION OF SEWAGE SLUDGE TO AGRICULTURAL LAND IN MINNESOTA (FINAL ENVIRONMENTAL STATEMENT),
Agricultural Research Service, Washington, D.C.
T. W. Edminster.
Available from the National Technical Information Service, as EIS-MN-73-1813-F, $4.00 in paper copy. (1973). 38 p, 4 fig.

Descriptors: *Sewage sludge, *Water reuse, *Water pollution, *Water pollution control, *Terracing, *Sludge disposal, Non-structural alternatives, Soil conservation, Sludge treatment, Land use, Agriculture, *Minnesota, Project planning, Research and development, Environmental sanitation, Environmental effects, Crop production, Land management, Adoption of practices, Farm management.
Identifiers: *Environmental Impact Statements, Rosemont(Minn.).

A project is proposed to develop a practical and complete system for the handling and use of sewage sludge on agricultural land. The objectives of this proposal were two-fold. The first was to demonstrate safe, efficient and practical methods for the application of sewage sludge to land in harmony with agricultural usage while controlling pollution of surface and ground waters through a program of total water management. The second was to collect information on specific practices for land application of sewage sludge so that safe management guidelines can be developed for various soil, crop, and climatic situations in northern climates. The physical set-up is a 40-acre watershed, which will be level terraced with grassed back slope terraces with surface inlet tile drains. Three alternatives were considered: incineration of the sludge, landfill for its disposal, and various treatment processes. Favorable environmental impacts include development of a conservation system that will reduce sediment loss from the field, and wildlife cover will be provided. Further, such development of sludge uses will yield a favorable economic method of disposal with less adverse pollution effects, and tap a valuable resource now wasted. The adverse effects are minimal and remote, centering around the possibilities of overflow and spillage. (Sutton-Florida)

GENERAL PLAN FOR RECOMMENDED STORM DRAINAGE FACILITIES, MARION COUNTY, OHIO.
Brown (Floyd G.) and Associates, Ltd., Marion, Ohio.
Available from the National Technical Information Service as PB-221 521, $6.75 in paper copy, $1.45 in microfiche. Final report prepared for the Marion County Regional Planning Commission. May 1973. 62 p, 15 plates, 3 tab, 5 append. Ohio P-299-9.

Descriptors: *Storm drains, *Drainage systems, *Planning, Separated sewers, Storm runoff, Urban drainage, Administration, Project planning, Rational method, Flooding, *Ohio.
Identifiers: *Marion County(Ohio), Scioto River Basin(Ohio), Marion(Ohio), Oleotangy River Basin(Ohio), Sandusky River Basin(Ohio).

Existing storm drainage facilities, anticipated storm drainage needs, and the adequacy of existing systems to meet the projected needs for the year 2000 are examined. The inventory includes information on line locations, sizes, grades and conditions. Maps delineate both existing systems and proposed storm drains. Most of the villages and communities in Marion County have combined systems for carrying the flow of both wastewater and storm drainage. The majority of these are too small to provide adequate drainage during storms. Future land use and service areas in the county must be coordinated to permit an efficient storm drainage system. Projected population growth for the Marion Urban Area for 2000 is 78,000 (45,000 in 1970), incorporated villages 7,115 (5,450 in 1970) and unincorporated areas 89,565 (51,905 in 1970). Density of the Marion Urban Area is expected to remain fairly constant. Slight increases in density may occur in villages and unincorporated areas. Specific recommendations are made for each village. Phased construction is recommended, beginning with those villages with the greatest population and growth potential, with priorities assigned in the recommended storm drainage plan to provide guidance in constructing and financing the necessary improvements. No conclusions are made on the desirability of any of the alternative methods of administration, whether it be on a local, county or watershed basis. Appendixes include a discussion of the Rational Method of estimating storm runoff, design factors for storm drains and an environmental assessment. (Hoffman-North Carolina)

WATER BALANCE IN SEWAGE STABILIZATION LAGOONS,
North Dakota Univ., Grand Forks. Dept. of Civil Engineering.
O. O. Fossum.
Available from the National Technical Information Service as PB-233 482, $3.25 in paper copy, $1.45 in microfiche. Completion Report WI-221-14-72, August 1971. 38 p, 16 fig, 4 tab, 13 ref. OWRR A-009-NDAK(1). 14-31-0001-3234.

Descriptors: *Waste water treatment, Sewage treatment, *Seepage, *Sewage lagoons, Oxidation lagoons, Mass transfer, Evaporation, Groundwater movement, Water quality standards, Water balance, Solid wastes, Chlorides, Phosphates, Sulfates, Fluorides, Water levels.
Identifiers: Groundwater tables.

Site selections and construction details have often ignored seepage beyond the requirements that the lagoon bottom should be a relatively impervious material, such as clay, and no seepage into wells or groundwater supplies should be permitted. Enforcement of Water Quality Standards makes it necessary to retain high water levels in sewage lagoons for longer periods of time than has been done in the past. There have been complaints from adjacent land owners that lagoon seepage was damaging crop land, and damage claims have been filed through legal channels. A value is proposed for the coefficient, N, of .000271 in the mass-transfer equation. Use of this coefficient, the wind speed, and the humidity gradient permits calculation of evaporation. Also proposed is a seepage rate of .0032 feet per day which permits determination of seepage loss. Limitations on their usage are discussed. Evidence is presented showing definite effects on groundwater tables for distance of approximately 400 feet. Conditions which create serious damage to productivity or adjacent land for distances of 300 feet or more are discussed. Effects on groundwater quality as indicated by total solids, chlorides, sulfates, phosphates and fluorides are presented and related to natural and artificial topographic features.
W74-09361

AN EXPERIMENTAL STUDY OF A WASTE-WATER TREATMENT SYSTEM SUITABLE FOR SHIPBOARD USE,
Hydronautics, Inc., Laurel, Md.
C. E. Brown, M. Frommer, J. Ricklis, and A. Gollan.
Available from NTIS, Springfield, Va. 22151, as AD-764 448, Price $3.75 printed copy; $1.45 microfiche. Final Contract Report 734321.4.1 to U.S. Coast Guard, July 1972. 76 p, 29 fig, 9 tab, 6 ref. 734321. DOT-CG-12, 186-A.

Descriptors: *Waste water treatment, *Waste disposal, *Incineration, Sludge disposal, *Membrane processes, Reverse osmosis, Ships, Filtration.

A waste treatment system for ships uses membrane lined tubes for filtration and concentration and a compact pebble bed incinerator for sludge disposal. The incinerator was constructed and tested with satisfactory results burning a digested sludge of 6% solids concentration. Effluent quality and flux were measured for each membrane at several pressures and internal flow speeds. An overall concentration ratio for suspended solids of 130 was reached starting out with a typical raw sewage containing approximately 1000 ppm of total solids. Quality of the effluent was high, containing an average BOD of less than 75 ppm for the best membranes tested. Coliform count was reduced four orders of magnitude with average residuals of less than 1000 per 100 milliliter. (Knapp-USGS)
W74-09373

DISPOSAL OF AIRCRAFT WASHRACK WASTE WATER,
New Mexico Univ., Albuquerque. Eric H. Wang Civil Engineering Research Facility.
B. D. Reinert.
Available from NTIS, Springfield, Va. 22151, as AD-763 095, Price $3.75 printed copy; $1.45 microfiche. Air Force Weapons Laboratory Technical Report AFWL-TR-73-33, June 1973. 36 p, 13 fig, 8 tab, 14 ref.

Descriptors: *Waste water treatment, *Oily water, *Cleaning, Aircraft, Sewage treatment, Facilities, Detergents, *Activated sludge, Coagulation, Centrifugation, Separation techniques, Dilution.
Identifiers: Wash water(Aircraft).

To evaluate methods of treating aircraft washrack waste water, tests included dilution in an activated sludge treatment plant, filtration through a synthetic media filter, and centrifugation using both continuous-flow and batch centrifuges. Activated sludge treatment was suitable at a 6% dilution with domestic sewage. The chemical oxygen demand and emulsified oil concentrations at this dilution were 1000 and 200 mg/liter, respectively. Coagulation of washrack waste water with alum, followed by filtration, was not economical because of the excessive chemical additions required. Centrifugation of washrack waste water was not feasible because oil removal was negligible even at relative centrifugal forces as high as 20,000. (Knapp-USGS)
W74-09376

TREATMENT OF ELECTROPLATING WASTES BY ION EXCHANGE,
New Mexico Univ., Albuquerque. Eric H. Wang Civil Engineering Research Facility.
R. B. Lehmann.
Available from NTIS, Springfield, Va. 22151, as AD-767 229, Price $3.00 printed copy; $1.45 microfiche. Air Force Weapons Laboratory Technical Report AFWL-TR-73-124, August 1973. 33 p, 6 fig, 8 tab, 8 ref. Contract F29601-72-C-0024.

Descriptors: *Ion exchange, *Anion exchange, *Waste water treatment, *Heavy metals, Recycling, Waste reuse, Nickel, Copper, Cadmium, Zinc, *Industrial wastes.
Identifiers: *Cyanide, *Electroplating wastes.

Strong anion resins (Dowex MSA-1, Amberlite IRA-938, Duolite A-102D) and mixed bed systems (Dowex MSA-1 and MSC-1, Amberlite IRA-938 and IR-120 plus, Duolite A-102D and C-20) were tested in an attempt to find a satisfactory ion exchange system for the removal of cyanide and heavy metals (Ni, Cu, Cd, Zn) from dilute electroplating wastes. The strong anion resins remove both the cyanide and the metal as an anionic complex species. While the removal produces acceptable effluent for disposal into public sewage systems, the capacity of the resin decreases with successive regenerations. In some resin systems this decrease in capacity was as high as 56%. In addition, the regeneration liquids contain anionic complex metal cyanides which are unsuitable for recycling and require further treatment. (Knapp-USGS)
W74-09377

THE USE OF OCEAN OUTFALLS FOR MARINE WASTE DISPOSAL IN SOUTHEAST FLORIDA'S COASTAL WATERS,
Miami Univ., Fla. Sea Grant Institutional Program.
T. N. Lee, and J. B. McGuire.
Available from NTIS, Springfield, Va. 22151 as COM-73-10925 Price $3.00 printed copy; $1.45 microfiche. Coastal Zone Management Bulletin Series No 2, January 1973. 19 p, 5 fig, 4 ref. NOAA SG 2-35147.

Descriptors: *Waste water disposal, *Florida, *Outlets, *Outfall sewers, *Water pollution control, Water pollution sources, Sewage treatment, *Waste water treatment.

The ocean outfall method of sewage disposal as presently practiced in South Florida is unsafe and a detriment to the ecology and aesthetics of the area. Options for the improvement of the system are proposed. These are: extend all of the existing outfall lines to a depth of 300 to 400 feet; install diffusers to improve the mixing and initial dilution of the effluent; and provide secondary treatment with a high level of chlorination. Attempts should continue to find methods to remove viruses. (Knapp-USGS)
W74-09403

TREATMENT OF WASTEWATERS FROM MILITARY FIELD LAUNDRY, SHOWERS, AND KITCHEN UNITS,
Army Mobility Equipment Research and Development Center, Fort Belvoir, Va.
D. S. Lent, and R. G. Ross.
Available from NTIS, Springfield, Va. 22151 as AD-765 483 Price $3.50 printed copy; $1.45 microfiche. Report 2061, May 1973. 53 p, 15 tab, 2 append. IG 66 2708 DJ 39-10.

Descriptors: *Waste water treatment, *Military reservations, *Activated carbon, Electrolytes, *Polyelectrolytes, Water reuse.

A wastewater treatment process utilizing powdered activated carbon, a cationic polyelectrolyte and a modified standard Army water purification unit was evaluated for wastewaters from field mili-

tary showers, laundries, kitchen units, and a laundromat. A modified standard Army water purification unit (ERDLator) can be utilized effectively for treating wastewater generated in field operations. A high quality water is produced when treating shower and blended wastewaters. Blending the kitchen and laundry waters with shower water reduces or eliminates the problems encountered when treating the waters separately. Carbon sludge can be reused as a supplement to fresh carbon for treating the wastewater. The carbon sludge produced is easily dewatered, and the volume of sludge generated minimizes the sludge disposal problem. (Knapp-USGS)

LAND APPLICATION OF WASTEWATER,
Environmental Protection Agency, Washington D.C. Div. of Municipal Waste Water Programs.
B. L. Seabrook.
In: Proceedings of Workshop on Land Disposal of Wastewaters, November 20, 1973, Raleigh, N.C.: North Carolina University Water Resources Research Institute Report No 91, p 1-35, 1973. 1 fig.

Descriptors: *Waste water disposal, *Irrigation, Sprinkler irrigation, Water spreading, Waste water treatment, Sewage treatment, *Water reuse.
Identifiers: *Land disposal(Wastes).

A field survey was made of approximately 100 facilities in all climatic zones where community or industrial wastewaters are being applied to the land. Another survey was carried out to ascertain the nature and extent of State health and water pollution control regulations governing the use and control and land application systems. Land application of effluent is employed to provide supplemental irrigation water, to give economical alternative solutions for treating wastes and discharging them without causing degradation of rivers, lakes and coastal waters, and to overcome the lack of suitable receiving waters and eliminate excessive costs of long outfall lines to reach suitable points of disposal into large surface bodies of water. Although facilities of all types were surveyed, this report is primarily concerned with irrigation-type facilities for supplying supplemental water to crop areas, forest areas and unharvested soil cover acreages. Spray irrigation is the most frequently used (57 facilities) method of application, although most municipalities use more than one method. Ridge-and-furrow irrigation is used at 23 facilities and flooding irrigation by 34 systems. Industry generally uses spray irrigation. (See also W74-09422) (Knapp-USGS)
W74-09423

MANAGEMENT OF LANDS USED FOR WASTE DISPOSAL,
North Carolina State Univ., Raleigh. Dept. of Soil Science.
J. A. Phillips.
In: Proceedings of Workshop on Land Disposal of Wastewater, November 20, 1973, Raleigh, N.C.: North Carolina University Water Resources Research Institute Report No 91, p 37-41, 1973.

Descriptors: *Waste disposal, *Land management, *Waste water disposal, Landfills, Water spreading, Waste water treatment, Waste treatment.
Identifiers: *Land disposal(Wastes).

In order to manage land for waste disposal, a knowledge of the soil and its physical and chemical characteristics that occur in the waste field must be obtained. Soil physical properties that are of importance are soil depth, infiltration rates, texture, structure, types of clay, permeability, and porosity. Regardless of the use that is made of the land, care must be taken to prevent any waste or waste water from reaching the surface water or groundwater in order not to violate water quality standards. If the land is to be used for waste disposal solely or is dedicated for the disposal of waste only, the main criterion is the protection of the environmental quality. However, if crop production is to be coupled with the waste disposal, the amount that is to be applied to any particular crop would be determined by the current fertility levels of the soil and the fertility needs of the crop itself. WASTEWATER AND SOIL INTERACTION,
North Carolina State Univ., Raleigh. Dept. of Soil Science.
B. L. Carlile.
In: Proceedings of Workshop on Land Disposal of Wastewaters, November 20, 1973, Raleigh, N.C.: North Carolina University Water Resources Research Institute Report No 91, p 43-47, 1973.

Descriptors: *Waste disposal, *Land management, *Waste water disposal, Landfills, Water spreading, Waste water treatment, Waste treatment.
Identifiers: *Land disposal(Wastes).

The application of any wastes on land may be considered a recycling process for the essential nutrients and biodegradable organics but only a disposal repository for all other nonessential and nondegradable components. Loading factors to be considered in the design and successful operation of a land treatment system are hydraulic loading, nutrient loading, organic loading, salt loading, and toxic elements. Good soil and water conservation practices are needed to prevent direct runoff of wastewater from the land to insure the percolation of the water through 4 or 5 feet of unsaturated soil which should remove pathogenic organisms. (See also W74-09422) (Knapp-USGS)

IRRIGATION COST FOR LAND DISPOSAL,
North Carolina State Univ., Raleigh. Dept. Biological and Agricultural Engineering.
R. E. Sneed.

Descriptors: *Waste water disposal, *Economic *Sprinkler irrigation, Installation costs, Operati costs, Tertiary treatment, Cost-benefit analysis.
Identifiers: *Land disposal(Wastes).

Any type of irrigation system for land disposal waste should be a complete system. The desig must know the soil characteristics, the compo tion and strength of the wastes, and the amount wastes to be applied. The irrigation system sho be designed to meet all these criteria; it should b complete system capable of handling the wastes a safe and economical manner. For land dispos automated systems are most satisfactory and easiest system to automate is probably a p manent sprinkler system. Initial cost is ab $1,400 per acre. Operational cost is about $0.10 1000 gallons based on a 1,000,000 gallon-per-d plant. (See also W74-09422) (Knapp-USGS)

TREATMENT SYSTEMS FOR ANIMAL, AGRICULTURAL AND MUNICIPAL WASTES,
North Carolina State Univ., Raleigh. Dept. of Biological and Agricultural Engineering.
F. J. Humenik.
In: Proceedings of Workshop on Land Disposal of Wastewaters, November 20, 1973, Raleigh, N.C.: North Carolina University Water Resources Research Institute Report 91, p 91-103, 1973. 1 fig, 5 tab.

Descriptors: *Waste water treatment, *Waste water disposal, *Farm wastes, *Municipal wastes, *Irrigation, Nutrients, Sewage treatment, Anaerobic digestion, Lagoons.
Identifiers: *Land disposal(Wastes).

Many of the simple systems developed for the pretreatment and terminal disposal of agricultural waste on land can be applied to municipal waste and in particular are very feasible for the treatment of rural domestic waste. Unaerated ponds can provide significant pretreatment at a very low cost. The treatment efficiency of ponds can be increased by utilizing series systems and providing aeration in the first unit. Pond systems can also be managed to facilitate nitrification-dentrification when aeration is employed in the first unit, and the second unit is maintained anaerobic by direct raw waste inputs. Pond systems must be considered as pretreatment devices prior to land irrigation of excess liquid. Land irrigation is limited either by the hydraulic or process load. The gigher degree of treatment provided or the lower the concentration of nitrogen, the less value the excess water has for fertilization and the more controlling hydraulic loading becomes. Current recommended loading rates are to apply no more nitrogen than fertilizer recommendations for a particular vegetative cover. Therefore, the most economic approach is to balance both the hydraulic and process load so that the application limit for both liquid and nitrogen closely interrelate for each waste stream. STABILITY AND CONTROL OF ANAEROBIC DIGESTION,
Metropolitan Sanitary District of Greater Chicago, Ill.
L. P. Graef, and J. F. Andrews.
Journal Water Pollution Control Federation, Vol 46, No 4, p 666-683, April 1974. 14 fig, 24 ref.

Descriptors: *Sludge digestion, *Anaerobic digestion, Control, *Waste treatment, *Computer studies, *Model studies, Organic loading, Toxins, Design standards, Operation and maintenance, Sludge treatment, Methane, Sludge, Alkalinity, Carbon dioxide, Digestion, Control systems.
Identifiers: *Overloads, Hydrocarbons, Control strategies, Stability, Process control.

The dynamic response of the anaerobic digester to organic, toxic, and hydraulic overloading was simulated with a hybrid computer to evaluate process stability indicators, design and operation factors influencing process stability, and control strategies. The rate of methane production was one of the best indicators for detecting impending failure caused by toxic compounds. Improved process stability with respect to organic overloading can be achieved by increasing the residence time, alkalinity, influent sludge concentration, and digested sludge recycle. Three control strategies (scrubbing of carbon dioxide from the gas phase with subsequent gas recycle, addition of a base, and digested sludge recycle) were investigated. Consideration of process stability and implementation of control strategies could improve digester operation, permit increased loadings on existing digesters, and decrease the required volumes of new digesters. KINETICS OF ACTIVATED SLUDGE OXYGENATION,
Texas Univ., Austin. Dept. of Civil Engineering.
M. J. Humenick, and J. E. Ball.
Journal Water Pollution Control Federation, Vol 46, No 4, p 735-747, April 1974. 10 fig, 2 tab, 31 ref.

Descriptors: *Activated sludge, *Aeration, *Oxygenation, *Kinetics, *Sludge digestion, Settling velocity, Sludge, Dissolved oxygen, *Waste water treatment, Oxygen, Laboratory tests, Odor, Waste treatment, Benefits, Oxygen demand, Biological treatment.

A laboratory-scale activated sludge reactor was used to determine the effect on sludge settleability, kinetics, and sludge production of using pure oxygen versus air in the aeration stage. No significant differences were found in the sludge yield coefficient, decay coefficient, or substrate removal kinetics, whether using air or oxygen. Neither were there any significant differences in the initial settling velocity of activated sludge in the zone settling region. The initial settling velocity was found to be a function of the mean cell retention time and the intensity of previous mixing. Although the kinetic and growth characteristics of activated sludge developed under oxygenation seem to be the same as under aeration, several inherent advantages may be realized by the use of high-purity oxygen. Benefits may include the ability to supply high oxygen demand at the influent end of a reactor, odor control advantages of a closed system, significant dissolved oxygen concentrations in the plant effluent, efficient oxygen transfer at low mixing velocities, reduced reactor size, higher possible food-to-microorganism ratios, less net sludge production, and reduced size of sludge-processing equipment. THERMAL SLUDGE CONDITIONING IN KALAMAZOO, MICHIGAN,
Kalamazoo Dept. of Public Works, Mich.
D. H. Swets, L. Pratt, and C. C. Metcalf.
Journal Water Pollution Control Federation, Vol 46, No 3, p 575-581, March 1974. 5 fig, 5 tab.

Descriptors: *Sludge treatment, Heat treatment, Treatment facilities, *Dewatering, *Incineration, *Municipal wastes, Operating costs, Operations, Operation and maintenance, *Michigan.
Identifiers: *Kalamazoo(Mich), *Thermal conditioning, Sludge conditioning, Vacuum filtration, Thickeners.

The city of Kalamazoo, Michigan, operates a thermal sludge conditioning system to treat sludge from its waste water treatment plant. Sludge from the existing thickeners is treated in three conditioning units, each having a capacity of 32.5 tons (29.5 metric tons) of dry solids/day. Each unit is designed to operate at 25% above the normal 400 psi (28 kg/sq cm) pressure and consists of a sludge grinder; centrifugal feed pump; positive-displacement, diaphragm-exchange, high-pressure sludge pump; heat exchangers; reactor; steam generator; gas-liquid separator; and pressure control valves. The sterile treated sludge is thickened in two 70 ft. (21.3 m) diameter thickeners with rotating rake mechanism and dewatered on three vacuum filters without the use of chemical flocculants. The dried sludge is incinerated. Process vapors from the sludge thickening tanks are discharged into the incinerators as combustion air. The operating characteristics of the thermal conditioning plant and associated operational problems are discussed. The operating cost/ton of sludge processed (excluding operating and maintenance labor) is given. (Witt-IPC)

DEWATERING DIGESTED PRIMARY SLUDGE,
Los Angeles County Sanitation District, Calif.
J. D. Parkhurst, R. P. Miele, S. T. Hayashi, and F. F. Rodrigue.
Journal Water Pollution Control Federation, Vol 46, No 3, p 468-484, March 1974. 12 fig, 6 tab.

Descriptors: *Sludge treatment, *Dewatering, *Centrifugation, *Operating costs, *Pilot plants, Costs, Economics, Solid wastes, Polymers, Anaerobic digestion, Sludge, Solid wastes, Separation techniques, Treatment facilities, Additives, *California, Sludge digestion.
Identifiers: *Los Angeles County(California).

A sludge dewatering research project was conducted at the Joint Water Pollution Control Plant of the County Sanitation Districts of Los Angeles County (California) to find a system capable of recovering at least 95% solids from anaerobically digested primary sludge. Fourteen months of pilot plant studies revealed that five conditioning-dewatering schemes were capable of satisfying the requirement. Based on performance and economic factors, a two-stage centrifugation system using horizontal scroll centrifuges followed by basket centrifuges was selected. Cationic polymer was used to condition the basket centrifuge feed. The unit cost for dewatering 300 dry tons/day (272,100 kg/day) was estimated to be $29/ton ($0.032/kg). (Witt-IPC)

REUSE AND RECYCLE OF WATER IN INDUSTRY,
Bostock Hill and Rigby, Birmingham (England).
C. J. Appleyard, and M. G. Shaw.
Chemistry and Industry, No 6, p 240-246, March 16, 1974. 2 tab, 10 ref.

Descriptors: *Water reuse, *Recirculated water, *Industrial water, *Waste water reclamation, *Waste water treatment, *Recycling, *Impaired water use, *Reclaimed water, *Water conservation, Chemical industry, Food processing industry, Electronics, Steel, Metallurgy, Mining, Water pollution control, Chemcontrol, Economics, Cost-benefit analysis, Regulation, Legal aspects.

The status and prospects of water reuse in various industries are reviewed, including case histories from the food, electronic, and steel industries. Treatment techniques prior to water recycling are surveyed. Motivation for increased recycling will come from stricter water quality standards, diminishing availability of resources, and greater cost of clean water. The first consideration by industry will remain direct savings accruing from minimized freshwater intake and process losses. Direct reuse of sewage effluent as industrial or second-class water requires further study, particularly in heavily industrialized areas with short transport distances. Present technology seems already adequate, and future trends may lie in chemical-physical treatments combining several high-rate processes to provide better than expected economies. (Brown-IPC)

INPLANT PH CONTROL PERMITS OPTIMUM AERATION EFFICIENCY,
Weyerhaeuser Co., Everett, Wash.
F. B. Howard.
Pulp and Paper, Vol 47, No 13, p 108-111, Dec., 1973. 3 fig, 1 tab.

Descriptors: *Waste water treatment, *Hydrogen ion concentration, *Aeration, *Pulp wastes, *Bleaching wastes, Mixing, Control systems, Control, Pulp and paper industry, *Washington, Alkalinity, Acidity, Lime, Calcium carbonate, Biochemical oxygen demand, Biological treatment.
Identifiers: Kraft mills, Chemical recovery, pH control, Black liquors, Spent pulping liquors, *Everett(Wash).

Difficulties in meeting BOD reduction requirements led to installation of a secondary aeration process at Weyerhaeuser Co.'s kraft mill in Everett, Washington. The pH of combined mill effluents from the primary treatment varied from 2 to 12, much too widely for effective secondary treatment for which pH 6-8 is the best range. The proper sequencing of combining separate effluents was found to be the key to total effluent pH control. Particularly, by combining the acid bleach plant waste with the alkaline stream from the chemical recovery plant which contains calcium carbonate and hydroxide, the total effluent's pH was brought within the desired range most of the time. Occasionally, an additional amount of lime had to be added. (Hansen-IPC)

TREATMENT AND DISPOSAL OF CHEMICAL PHOSPHATE SLUDGE IN ONTARIO,
Ontario Ministry of the Environment, Toronto.
G. L. Van Fleet, J. R. Barr, and A. J. Harris.
Journal Water Pollution Control Federation, Vol 46, No 3, p 582-587, March 1974. 14 ref.

Descriptors: *Phosphorus compounds, *Canada, *Waste water treatment, *Municipal wastes, Chemical wastes, International Joint Commission, Laboratory tests, On-site tests, Treatment facilities, Programs, Project planning, Pollution abatement, Lakes, Great Lakes.
Identifiers: *Ontario(Phosphorus discharge control).

Ontario is involved in a 5-year program to control, by 1975, phosphorus discharges from more than 200 existing municipal waste water treatment plants serving a population of 4.7 million. Phosphorus removal facilities must be installed and operational in 75% of these plants by the end of 1973. The program is a response to International Joint Commission recommendations on the Lower Great Lakes and the demonstrated need for nutrient controls in prime recreational waters throughout Ontario. Existing waste treatment ranges from lagoons to activated sludge and tertiary treatment processes, with plant capacities up to 180 million gallons/day. The integration of chemical treatment into these processes has required a broad program of research that, to date, has involved laboratory and full-scale investigations at more than 60 plants. CLEANING PAPER INDUSTRY EFFLUENTS BY MEANS OF ACTIVATED CARBON (UEBER DIE REINIGUNG PAPIERINDUSTRIELLER RESTABWAESSER MITTELS AKTIVKOHLE),
Technische Universitaet, Darmstadt (West Germany). Wasser- und Abwasserforschungsstelle.
W. Brecht, and H-L. Dalpke.
Wochenblatt fuer Papierfabrikation, Vol 101, No 14, p 501-513, July 31, 1973. 11 fig, 8 tab, 24 ref. English summary.

Descriptors: *Waste water treatment, *Pulp wastes, *Activated carbon, *Biological treatment, *Comparative costs, *Comparative benefits, Effluents, Biochemical oxygen demand, Color, Chemical oxygen demand, Costs, Operating costs, Organic loading, Foreign research, Europe, Particle size.

Granular activated carbon, which can be regenerated, was found suitable for the practical adsorption of BOD loadings from pulp and paper mill effluents. The theory and practice of this process are discussed. Experiments indicate that the carbon particles should not be too fine, that the effluent load should not exceed 100 mg of 5-day BOD/liter, and that frequent backwashing of the adsorbent should be performed. Under these conditions, the process can replace biological purification. Complete color removal and increased COD reduction are its main advantages, albeit at somewhat higher costs than for biological treatment. The possibility of combining bio-purification with activated C treatment is recommended for study. (Speckhard-IPC)

AVAILABLE AIR MEASUREMENTS APPLIED TO FLOTATION THICKENER EVALUATIONS,
CH2M/Hill, Inc., Corvallis, Oreg.
K. V. Leininger, and D. J. Wall.
Deeds and Data (Water Pollution Control Federation), p D1, D4-D8, May, 1974. 6 fig, 1 tab, 9 ref.

Descriptors: *Treatment facilities, Equipment, *Flotation, *Sludge treatment, *Dewatering, *Air entrainment, *Air demand, Pressure, Saturation, Dissolved oxygen, Sampling, Water sampling, Mathematical studies, Operation and maintenance, Flow, Suspended solids, Sludge digestion.
Identifiers: *Thickeners(Dewatering filters), Calculations(Computations), Clarifiers.

Studies of flotation thickeners seldom give proper estimates of the air volume actually available for flotation of sludge. Conventional calculations of air balance in a pressurized saturation system do not verify that all the air is actually being dissolved, nor do they provide direct measures of the air available for flotation. A new sampling method is presented which does determine this air volume. It measures the air released from solution upon depressurization of a highly saturated flow as it leaves a pressurized dissolved-air system. Example calculations are presented for the percent saturation efficiency of a pressurized system and for the air:liquid ratio of the pressurized flow to a flotation process. The calculated available air supply rate can be divided by a known or desired solids loading rate to determine the available air:solids ratio for any particular application, which is one of the most important factors in flotation thickening. OXIDATION AND AERATED LAGOON OPERATION,
Safford Municipal Utilities, Ariz.
E. R. Etter.
Deeds and Data (Water Pollution Control Federation), p D2-D3, May, 1974.

Descriptors: *Lagoons, *Aerated lagoons, *Operation and maintenance, *Waste water treatment, *Monitoring, *Water quality control, Sodium compounds, Nitrates, Algae, Color, Odor, Hydrogen ion concentration, Dissolved oxygen, Weed control, Temperature, Weather patterns, Optimization, Pondweeds.

The prime responsibility of a pond operator is to monitor and aid natural processes of waste treatment by providing an optimum environment. He should watch for signs of pond imbalance (water color, floating surface matter, odor evolution, and conditions of banks) and of septicity. He should keep records of dissolved oxygen, pH, relative stability, temperature, and weather conditions; remove weeds from the water; and have sodium nitrate available to prevent algal dieoff. STUDIES ON INTERNAL REUSE OF SULFITE EVAPORATOR CONDENSATES (UNTERSUCHUNGEN ZUR INNERBETRIEBLICHEN WIEDERVERWENDING VON SULFITABLAUGENEINDAMPFKONDENSATEN),
Institut fuer Zellstoff und Papier, Heidenau (East Germany).
B. Bach, G. Fiehn, and H. Schmidt.
Zellstoff and Papier, Vol 22, No 12, p 355-363, Dec 1973. 3 fig, 13 tab, 18 ref.

Descriptors: *Water reuse, *Impaired water use, *Sulfite liquors, *Pulp wastes, *Recirculated water, Condensation, Evaporation, *Water conservation, Industrial water, Pulp and paper industry, Pollution abatement, Water pollution control, Recycling, Biochemical oxygen demand, Chemical oxygen demand, Ion exchange, Anion exchange, Effluents, Water pollution sources.
Identifiers: *Evaporator condensates, Spent sulfite liquors, Sulfite pulp mills, Bleach plants, Pulp washing, Wash water.

A study of the composition and properties of spent sulfite liquor evaporation condensates indicated severe increases in BOD and COD of sulfite pulp mill effluents loaded with such condensates. In many Scandinavian sulfite mills, these condensates are, therefore, recycled either to the cooking liquor preparation or to the pulp washing stage, despite some ensuing operating problems. Two possibilities for internal reuse are proposed: (1) Untreated condensates might be reused in the bleach plant. (2) Partial purification by anion exchange would reduce the BOD by 50-60% and the COD by 70-75%, so that the treated condensates could be used in lieu of fresh water for pulping and pulp washing without adverse effects on pulp quality. PULP MILL WASTE WATERS: DISCHARGE AND PURIFICATION (ZELLSTOFFABWAESSER: ANFALL AND REINIGUNG),
Technische Hochschule, Vienna. (Austria). Institut fuer Wasserversorgung Abwasserreinigung und Gewasserschuts.
W. V. D. Emde, H. Fleckseder, L. Huber, and K. Viehl.
Wiener Mitteilungen Wasser, Abwasser, Gewaesser, Vol 13, June, 1973, 420 p. 69 fig, 8 tab, 1 map, 130 ref, append.

Descriptors: Waste water(Pollution), *Discharge(Water), *Water purification, Pulp and paper industry, Pollution abatement, Europe, *Pulp wastes, Water pollution control, *Air pollution, *Waste water treatment, *Water reuse, *Water conservation, Sulfite liquors, Wood wastes, Effluents, Water pollution sources.
Identifiers: *Austria, Kraft mills, Sulfite pulp mills.

A study was commissioned by the Austrian Department of Agriculture and Forestry to survey the extent of water pollution by pulp and paper mills and to recommend practical countermeasures. In chapters and an appendix (excerpted from Fleckseder's doctoral dissertation), the volume outlines the following topics: The technological and economic development and status of the Austrian (and some foreign) pulp and paper industries with emphasis on environmental impacts. The chemistry of wood and the technology of pulp manufacture. In-plant measures for water recirculation and conservation, spent liquor disposal, and by-product recovery. External effluent-treatment processes and facilities, including solids removal, flocculation, chemical coagulation, the Elektro-K process, screening, filtration, sedimentatio

flotation, BOD removal, aerobic-anaerobic aerated and nonaerated ponds and lagoons, activated sludge processes, trickling filters, color removal, adsorption, reverse osmosis, sludge handling and disposal, fines recovery from white waters and barking wastes, and the like. Air pollution and its control. Costs of antipollution installations for sulfite and kraft pulp and paper mills. Finally, recommendations are presented in general and specific terms for new and old sulfite mills and for existing kraft mills in the interest of pollution abatement. A selective bibliography of pertinent literature citations is appended. (Brown-IPC)
W74-09455

ULTRAFILTRATION SETS SAIL FOR NEW PROCESS SERVICES.
Chemical Engineering, Vol 81, No 4, p 88-89, Feb 18, 1974. 2 fig.

Descriptors: *Membrane processes, *Waste water treatment, *Filtration, *Reverse osmosis, Treatment facilities, *Equipment, Effluents, Pulp wastes, Chemical wastes, Chemical industry, Pulp and paper industry, Textiles, Paints, Metals, Detergents, Industrial wastes.
Identifiers: *Ultrafiltration, Ucarsep ultrafiltration system.

The 'Ucarsep' ultrafiltration system developed by Union Carbide Corp. can treat highly corrosive, solvating, and abrasive solutions at all practical liquid temperatures (up to 200 F) and pH values (2-14). The equipment uses porous carbon tubes as supports which are coated on their internal surfaces with separation membranes made of any one of several proprietary (not disclosed) inorganic compounds that are matched to the respective end-use requirements. A typical unit rated at a capacity of 2000 to 5000 gal/day comprises 151 tubes 48 inch long with 0.25 inch inside diameter, all housed in a shell of 6 inch diameter. At 100 psi pressure, its permeation rate exceeds 100 gal/sq ft/day. Typical applications of Ucarsep units include removal of oil and dirt from hot alkaline detergent solutions used for metal cleaning prior to painting, recovery and concentration of paint pigments from electroplating rinse waters, removal of textile size from aqueous effluents, and clear water recovery from black liquors and other pulp and paper mill effluents. (Witt-IPC)

STUDIES ON RENOVATION OF PULP MILL WASTE WATER: PILOT-PLANT TESTS FOR GRANULAR ACTIVATED CARBON ADSORPTION OF KRAFT PULP MILL WASTEWATER (IN JAPANESE),
Government Industrial Research Inst., Shikoku (Japan).
For primary bibliographic entry see Field 5B.
W74-09457

Descriptors: *Waste water treatment, *Pulp wastes, *Lignins, *Adsorption, *Activated carbon, *Chemical oxygen demand, Bleaching wastes, Lime, *Pilot plants, Industrial wastes, Foreign research, Waste treatment, Pulp and paper industry, Operating costs, Efficiencies, Consumptive use, Flow rate.
Identifiers: Chemical consumption, Alkaline extraction, *Japan, Kraft pulp, Kraft mills, Bleach plants.

Pilot-plant adsorption columns of activated carbon granules were used to remove lignin from a lime-pretreated brown stock (unbleached kraft pulp) wash water (containing 12-26 ppm of lignin and 25-30 ppm of COD) and from an activated sludge-treated and subsequently lime-treated kraft bleach plant (alkaline extraction) effleunt (containing 33-40 ppm of lignin). Adsorption isotherms and chemical consumptions were measured. At a surface flow rate of 1.7 m/hr and a contact time of 140 min, 1 kg of dry carbon sufficed to treat 3530 liters (based on lignin removals) or 3090 liters (based on COD removals) of lime-pretreated effluent, compared to 310 liters (lignin basis) or 3670 liters (COD basis) of a non-pretreated dilute wash water which contained as much lignin as did the limed effluent. These results indicate that lime pretreatment improves the absorption of lignin on activated carbon, but has little effect on COD removal. For lignin removal from alkaline extraction (bleaching) effluent, 1 kg of dry carbon was consumed in treating a relatively small volume (130 liters only). This lower efficiency is attributed to the higher lignin concentration of the bleach plant effluent. (Brown-IPC)

INROADS TO ACTIVATED CARBON TREATMENT,
L. C. Gibney.
Environmental Science and Technology, Vol 8, No 1, p 14-15, Jan, 1974. 2 fig, 2 tab.

Descriptors: *Waste water treatment, Industrial wastes, *Pulp wastes, *Organic loading, *Phenols, *Color, *Activated carbon, *Sewage treatment, Effluents, Adsorption, Toxicity, Molecular structure, Organic compounds, Alcohols, Acids, Polarity, Costs, Operating costs.
Identifiers: Molecular weight.

The activated carbon treatment of waste waters for removal of organic compounds offers several advantages over other effluent treatment processes, notably low land requirements, low sensitivity to fluctuations in pollution loadings, high removal rates, immunity against toxic wastes, flexibility in design and operation of treatment facilities, and reactivation and reuse capacities. Cost estimates are given for an expanded-bed, two-stage absorption installation for treating 10 million daily gallons of clarified raw sewage. Extensive laboratory data on the removal of color, phenol, and total organic carbon (TOC) from textile, food, chemical, plastics, rubber, metal, pharmaceutical, petroleum, and paper mill effluents are summarized. In 72% of all samples treated with activated carbon, 85% or better TOC removals were achieved. In more than 90% of the samples, color removals of 98% and phenol removals of 99% were attained. Problems remain regarding the adsorption of low-molecular-weight contaminants (having less than three carbon atoms per molecule) and of highly polar compounds (acids and alcohols). (Buchanan-IPC)

SOIL CLOGGING DURING INFILTRATION OF SECONDARY EFFLUENT,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
R. C. Rice.
Journal Water Pollution Control Federation, Vol 46, No 4, p 708-716, April, 1974. 9 fig, 1 tab, 12 ref.

Descriptors: *Soil disposal fields, *Soil contamination, *Infiltration, *Clogging, *Waste water treatment, *Groundwater recharge, Suspended solids, Infiltration rates, Hydraulic gradient, Algae, Soils, Soil dynamics, Soil physical properties, Soil moisture, Soil texture, Flooding, Water sources, Irrigation effects, Groundwater, Water types, Water resources, Water pressure, *Water reuse.

Maintaining high infiltration rates is a primary requirement when groundwater recharge facilities are used for reclamation of waste water effluent. Studies conducted in laboratory soil columns showed that clogging by suspended solids deposited on the soil surface was the predominant cause of infiltration reduction. Suspended solids concentrations should be kept below the 10 mg/liter for maximum infiltration. Soil clogging caused by biological activity was minimal. Algal growth on the soil surface restored the infiltration rate during inundation. High hydraulic gradients should be maintained when intermittent inundation schedules are used. (Witt-IPC)

BIOLOGICAL TREATABILITY OF TRINITROTOLUENE MANUFACTURING WASTEWATER,
Air Force Academy, Colo.
M. W. Nay, Jr., C. W. Randall, and P. H. King.
Journal Water Pollution Control Federation, Vol 46, No 3, p 485-497, March, 1974. 10 fig, 6 tab, 13 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Chemical wastes, Chemical industry, Biodegradation, Biochemical oxygen demand, Explosives, Biota, Metabolism, *Virginia, Toxicity, Microorganisms, Aquatic life, Nitrogen compounds.
Identifiers: *Trinitrololuene, *Radford(Va.) Army Ammunition Plant, Continuous process, Batch process.

A recent innovation in trinitrotoluene manufacturing has been the development of the countercurrent continuous flow process. Early studies that showed the waste to be toxic and refractory and the possibility of biological treatment to be marginal were done with waste samples from the older batch process. The new continuous process recycles many of the raw components to insure full use of their chemical potentials, and the waste water from this process is potentially more amenable to biological treatment. Biodegradability of trinitrotoluene waste water was demonstrated using dynamic BOD tests. The biota metabolism decreased as the trinitrotoluene concentration increased, illustrating that the waste has a threshold of toxicity to microbial systems. The rate of trinitrotoluene metabolism was slow compared with that of domestic waste water. A field-scale pilot plant for treating trinitrotoluene manufacturing wastes at the Radford Army Ammunition Plant in Virginia is proposed. (Witt-IPC)

FLOW SMOOTHING IN SANITARY SEWERS,
Environmental Protection Agency, Springfield, Ill.
C. N. Click, and F. O. Mixon.
Journal Water Pollution Control Federation, Vol 46, No 3, p 522-531, March, 1974. 16 fig, 2 tab, 11 ref. EPA 11010 FDI.

Descriptors: *Flow control, *Sewerage, *Waste storage, *Pipelines, *Economic feasibility, *Municipal wastes, Population, Interest rates, Cost comparisons, Flow characteristics, Design flow, Sewage treatment, Waste treatment.
Identifiers: Flow smoothing, *Flow smoothing basins, Relief piping.

Municipal waste water systems are usually designed with sufficient capacity to carry peak flows. However, as population grows and more load is placed on the normal municipal sewerage system, the point is inevitably reached at which the peak waste water flows exceed the design capacity of the sewerage system and additional capacity is needed. One possible way to provide this additional capacity is to install flow smoothing basins at key locations within the system. These basins would store waste water during periods of high delivery and release it later into the downstream piping at more nearly constant rates. A study was made to assess the feasibility of flow smoothing and to compare it with relief piping as a method of increasing the capacity of existing sewerage systems. The results show that circumstances that favor flow smoothing are high interest rates, high peak-to-average flow ratios, low pipe slopes, small pipe diameters, and low design depths of flow. Flow smoothing is strongly favored where earthen construction can be utilized. (Witt-IPC)

JOINT TREATMENT OF MUNICIPAL AND PULP MILL EFFLUENTS,
Green Bay Metropolitan Sewerage District, Wis.
K. G. Voelkel, D. W. Martin, and R. W. Deering.
Journal Water Pollution Control Federation, Vol 46, No 4, p 634-656, April, 1974. 14 fig, 11 tab, 11 ref.

Descriptors: *Municipal wastes, *Pulp wastes, *Activated sludge, *Waste water treatment, Pulp and paper industry, *Wisconsin, Bacteria, Chlorination, Nutrients, Sulfur bacteria, Pilot plants, Solids contact processes, Effluents, Industrial wastes, Sewage districts.
Identifiers: *Joint treatment, *Green Bay(Wis), Contact stabilization, Kraus process.

A project was undertaken to determine the feasibility of jointly treating Green Bay (Wisconsin) Metropolitan Sewerage District waste water with weak effluents from several paper manufacturers (American Can Co., Charmin Paper Products Co., Fort Howard Paper Co., and Green Bay Packaging Inc.), all located in Green Bay. Conventional, step aeration, contact stabilization, and Kraus activated sludge processes were studied simultaneously in four 1 gal/min (3.8 liters/min) pilot plants. Contact stabilization was selected as the most promising process and was studied further. After initial startup, the pilot plants became infested with the filamentous bacterium Thiothrix, a sulfur-storing organism. Chlorination of return activated sludge controlled its growth. Nutrient addition also was necessary. (Witt-IPC)

POSSIBILITIES FOR REDUCING THE EFFLUENT LOAD OF SULFITE PULP MILLS (MOEGLICHKEITEN ZUR BEHEBUNG DER ABWASSERBELASTUNG DURCH SULFITZELLSTOFFANLAGEN),
R. Fuechsel.
Das Oesterreichische Papier, Vol 10, No 9, p 13-15, 17-19, Sept, 1973. 6 fig.

Descriptors: *Treatment facilities, *Pollution abatement, *Pulp wastes, *Incineration, *Sulfite liquors, Water pollution control, Magnesium compounds, Magnesium hydroxide, Byproducts, Pulp and paper industry, *Waste water treatment.
Identifiers: *Sulfite pulp mills, *Chemical recovery, *Heat recovery, Copeland recovery process, Lenzing recovery process, Babcock recovery process, Spent sulfite liquors, Spent pulping liquors, Magnesium bisulfite.

Three systems for the recovery of chemicals and energy (heat) from magnesium-base spent sulfite pulping liquors are outlined and compared, all of which are effective in reducing the pollution load of discharged effluents. These systems make use of the Babcock, Lenzing, or Copeland recovery processes. The Babcock process involves co-current combustion, the Lenzing (Austrian) process counter-current combustion, and the Copeland process (developed by Container Corp. of America) fluidized-bed combustion of the spent liquors. The respective equipments used are described in some detail, including combustion chambers, absorption towers, venturi gas scrubbers, and the like. (Speckhard-IPC)

PAPER INDUSTRY AND ENVIRONMENTAL QUALITY,
International Paper Co., Ticonderoga, N. Y. Solid Waste Management.
C. S. Edgar.
Modern Lithography, Vol 40, No 8, p 12-15, 46, Aug, 1972. 2 illus.

Descriptors: *Pulp and paper industry, *Waste water treatment, *Fibers(Plant), *Recycling, *Environmental control, Resources, *Water conservation, Solid wastes, Water reuse.
Identifiers: Closed systems, Linear systems, Wood, Waste paper.

Energy, raw materials, and waste disposal are separate but critically important and interconnected parts of the paper industry's total environmental problem. Nature solves its energy, resources, and waste problems by way of closed systems. Emulating this example, the industry's artificial linear system with waste as an end-product must be changed into a circular or closed system, in which waste must serve as a resource. Although the paper industry's major raw materials (wood and water) are renewable resources, problems are encountered in utilization of waste products remaining after consumer use. Recycling or reuse of secondary fibers (waste papers) is one way of resource utilization, but is neither the only way nor always the best one. (Witt-IPC)

THE BEHAVIORS OF HEAVY METALS IN THE REGENERATION PROCESS OF SEWAGE TREATMENT ACTIVATED CARBON, (GESUI SHORI KASSEITAN NO KANETSU SAISEIJI NI OKERU JUKINZOKU NO KYODO),
Yokohama National Univ. (Japan). School of Engineering.
K. Urano, and K. Nakamura.
Gesuido Kyokai-shi, (J. Japan Sewage Works Association), Vol 10, No 115, p 19-22, December, 1973. 6 ref.

Descriptors: Sewage treatment, *Activated carbon, *Tertiary treatment, Metals, Treatment facilities, *Heavy metals, Municipal wastes, Waste water treatment.
Identifiers: *Secondary pollution, Reactivation.

The possibility of causing air pollution as a secondary pollution during the regeneration of particulate activated carbon by a heating process utilized in various sewage treatment plants was examined by measuring the heavy metal content released from the carbon. Six kinds of activated carbons used at various treatment plants were dried, packed in quartz tubes, and heated at various temperatures between 200 deg and 960 deg C for 10 to 80 minutes. After heating, the carbon was cooled in nitrogen, and 100 ml of 25 percent nitric acid was added. After boiling for two hours the carbon was filtered, diluted by distilled water, and analyzed for copper, chromium, manganese, lead, zinc, and mercury by atomic absorption. The results showed that activated carbon utilized in sewage treatment contained (per 1 kg of dry material), 800-1700 mg Cu, 150-1800 mg Cr, 15-80 mg Mn, 5-20 mg Pb, 500-1700 Zn, and 0-5 mg Hg. Since activated carbon before being used for sewage treatment contained almost no heavy metals, it was assumed that metals adsorbed on carbon due to the treatment process were considerable. Hg compounds at 200 deg C or more, and Zn and Pb compounds at 800 deg C are gasified when regenerating carbon. Since part of these metals will be released in the flue gas, it is necessary to install flue gas treatment system for reactivating used activated carbon. (Seigle-FIRL)

THE LAND TREATMENT PROCESS FOR WASTEWATER RENOVATION,
Illinois, Univ., Urbana. Dept. of Agronomy.
T. D. Hinesly.
Public Works, Vol 105, No 2, p 62-66, February, 1974.

Descriptors: Land management, Land use, *Soil management, *Irrigation, *Mist irrigation, Infiltration rates, *Infiltration, *Percolation, *Water treatment, Municipal wastes, *Waste water treatment.

The land treatment process for wastewater renovation is discussed with emphasis on spray irrigation. There are three distinct types of land treatment systems: overland flow, rapid infiltration/percolation, and crop irrigation. An overland flow land treatment system is used for soils with very low infiltration and/or percolation capacities. Rapid infiltration/percolation systems are used where deep permeable soil materials are available. The crop irrigation system may embody various methods of applying secondary-treated effluents by spray applications or flooding on land through furrows or borders. Spray irrigation has the greatest applicability to different soil types and cultural practices. This treatment may be used on varying terrain, requires less land preparation, and is less labor intensive when compared to other methods of irrigation. Maximum benefits are realized from the plant and animal nutrients recycled in growing plants, which is a most important reason for choosing irrigation over other systems. Maintaining a water-unsaturated aerobic zone in the soil surface ensures more complete filtering and adsorbing of wastewater pollutants. The site should be selected so that the frequencies and rates of water applications will be limited by the soil's capacity to filter, absorb, and precipitate pollutants, rather than by soil hydraulic characteristics. (Merritt-FIRL)

SELECTION OF THE IRON AND MANGANESE REMOVAL PROCEDURES TO BE USED IN SMALL WATER TREATMENT PLANTS (ALEGEREA SCHEMELOR DE DEFERIZARE SI DEMANGANIZARE A APEI LA STATIILE DE TRATARE MICI),
S. Nitescu.
Hidrotechnica, Vol 18, No 11, p 573-578, November, 1973. 13 ref.

Descriptors: Effluents, Municipal wastes, *Treatment methods, *Pilot plants, Aeration, Oxidation, Metals, *Iron, *Manganese, *Waste water treatment.

A simplified method for selecting the iron and manganese removal procedures to be used in small water treatment plants is presented. Usually the

removal procedures are selected by means of a pilot station. The cost of a pilot plant at a small treatment plant is high, due to the fact that the cost of the pilot station is almost equal to the cost of the production installation itself. Various factors have been verified which allows its elimination. The removal procedures are selected on the basis of physicochemical indices which are described and discussed. The procedures under consideration are aeration of water, oxidation of ferrous and manganese compounds, treatment with substances which increase the water's alkalinity, treatment of water with coagulant substances, decantation and filtration. Methods for differentiation of waters containing iron and manganese, treatment of water with mineral content, treatment of water with alkaline substances, or oxidizing substances, as well as methods for treatment of water with humic iron and manganese compounds, are presented. After selection of removal method, it is necessary to experiment on models in order to determine the optimum filtration parameters and chemical doses. (Urbanski-FIRL)

SPEED UP WATER PLANTS,
. R. Camp, and W. J. Kreske.
Water and Wastes Engineering, Vol 11, No 1, p 27-9, January, 1974. 1 fig.

Descriptors: Water treatment, Flocculation, Filtration, *Pre-treatment(Water), Costs, Monetary benefits, Pilot plants, *Massachusetts, Municipal wastes, *Waste water treatment.
Identifiers: *New Bedford(Mass).

A process to condition floc for filtration is described that eliminates sedimentation, reduces the needed size of flocculation units, and cuts chemical costs, while giving faster throughput. The basis for the Thomas R. Camp process is the relationship of floc volume concentration to mean velocity gradient. The method as claimed in the patent, U.S. 3,660,284, applied to operating conditions whereby water of wastewater is treated with from 6-50 ppm of floc-forming chemical in a mixing chamber operating at a mean velocity gradient corresponding to values of floc volume concentration between 50-300 ppm. The G values necessary to achieve the floc volume concentrations desired vary from about 150 to 1000 per second, and flocculation is essentially complete after five minutes of mixing at these speeds. A ten-month field test in New Bedford, Massachusetts, indicated that the Camp process was commercially feasible when applied to the highly colored water currently being used at New Bedford. The process saved New Bedford $1.75 million in capital for a new 30 mgd facility by eliminating the need for sedimentation basins. Savings in annual operating costs of a minimum of $15,000 could be achieved from reduced chemical requirements. (Merritt-FIRL)

PIONEERING PLANT PROVIDES COST-SAVING ALTERNATIVE TO SEPARATING SEWERS.
The American City, Vol 88, No 10, p 90-92, October, 1973. 2 tab.

Descriptors: Waste treatment, *Water treatment, Runoff, *Storm runoff, Lakes, *Cities, Wisconsin, *Combined sewers, *Treatment facilities.
Identifiers: *Kenosha(Wisc).

A modified contact stabilization process to produce a high quality effluent under stormflow conditions was utilized in Kenosha, Wisconsin. The runoff is degritted, mixed with activated sludge solids, clarified, and stabilized in four additions to the existing waste treatment plan: grit tank, contact tank, final clarifier, and stabilization unit. The entire process is automated and selected from the plant's main control board. Wet weather conditions are signalled by a level indicator in the dry weather grit tank's Parshall flume when the flow rises above 21 mgd. Biological adsorption was used because the first flush of the storm contains a high ratio of praticulate organic matter to soluble organics. In the first year of operation, the wet weather plant was activated 23 times with more than 92 million gallons of combined sewage treated. As a result, 91.5 percent of the suspended solids, 82.5 percent of the BOD, and 79.8 percent of the total organic carbon in that waste stream was kept out of Lake Michigan. (Merritt-FIRL)

CHECKING THE SIZE OF SEWERAGE INFILTRATION AND LEAKS OCCURRING UNDER OPERATING CONDITIONS, (VERIFICAREA MARIMII INFILTRATIILOR SI EXFILTRATILOR DIN CANALIZARI IN TIMPUL EXPLOATARII),
E. Blitz, and G. Tatu.
Hidrotehnica, Vol 18, No 6, - 283-288, 1973. 6 ref.

Descriptors: *Sewers, Engineering structures, Municipal wastes, Mathematics, *Infiltration, *Mathematical studies.

Some simple tools for checking the degree of infiltration of sewage systems as well as calculation methods are presented. Sewage infiltration and leaks under operating conditions can affect the functioning of the sewage system and the neighboring constructions. Since not all sewers can be provided with improved modern checking devices, simple verification and calculation methods had to be devised. Calculation methods are given for both ovoidal and circular sewage sections, using both mathematical formulae and tables. (Urbanski- FIRL)

A CASE STUDY OF CHLORINE CONTACT TANK INADEQUACIES,
Illinois State Water Survey, Urbana. Water Quality Section.
V. Kothandaraman, and R. L. Evans.
Public Works, Vol 105, No 1, p 59-62, January, 1974. 3 fig, 2 tab, 11 ref.

Descriptors: Waste treatment, *Treatment facilities, *Illinois, *Dissolved oxygen, Coliforms, *Chlorine, Municipal wastes, *Waste water treatment, Chlorination.
Identifiers: *Chlorine Contact Tank.

The physical, chemical, and bacteriological performance characteristics of the chlorine contact tank of the Pekin, Illinois, waste treatment plant were evaluated under air agitated and quiescent conditions. The hydraulic flow characteristics were determined by adding Rhodamine-B dye at the outlet end of the circular launder of the secondary settling tank. Samples were taken at the outlet end. Simultaneously samples were obtained from the inlet and outlet ends of the chlorine contact tank for pH and temperature measurements, residual chlorine determinations, and bacteriological analyses. The injected dye took five to ten minutes to be completely mixed, depending upon the rate of flow through the tank. Chemical and bacterial performance characteristics of the chlorine contact tank with and without air agitation were determined. The dissolved oxygen at the outlet was high (3.3 to 6.0 milligrams/liter) even though the dissolved oxygen content of the settling tank effluent in the collecting launder was zero or 0.1 milligrams/liter. The residual chlorine of the effluent samples was relatively high, varying from 1.6 to 3.6 milligrams/liter. The fecal coliform count, which is the controlling parameter, was higher than the desired limit in six of eight samples. It was concluded that the residence time distribution of the flow-through in a contact tank is important in obtaining satisfactory bacterial quality. (Merritt - FIRL)

RESTORATION OF WASTEWATER FACILITIES DAMAGED BY TROPICAL STORM AGNES,
Environmental Protection Agency, Washington, D.C. Emergency Operations and Planning Div.
E. K. Ernstrom, G. H. Zachos, and D. E. Braunscheidel.
Water and Sewage Works, Vol 121, No 2, p 42-43, 51-52, February, 1974. 2 tab.

Descriptors: *Flood damage, *Storm runoff, *New York, Waste water treatment, *Treatment facilities, Costs, Sewage, Historic floods, Regional flood, Disasters, Estimates.
Identifiers: *Tropical storm Agnes, Steuben County, N.Y., Chemung County, N.Y., Allegheny County, N.Y.

The recovery and restoration of waste water facilities damaged by tropical storm Agnes in June, 1972 are described. The storm caused severe flooding in New York's Southern Tier counties. Waste water collection and treatment systems sustained several million dollars worth of damage. Individual municipal cases are discussed along with the reactions and roles of local, state, and federal officials. The Environmental Protection Agency assisted in the flood relief and concentrated its efforts in the following areas: emergency repairs to water and sewage utilities; removal of oil and hazardous materials in the disaster area; rendering a preliminary dollar estimate of damages to water and sewage utilities in all 62 counties; and performing initial inspections, detailed cost estimates, eligibility determinations, interim inspections, and final inspections on damaged public utilities in the 26 counties declared eligible. Top priority was given to restoring the public water supply systems. The current total of eligible damages to environmental facilities in the declared counties is $7,218,170, with over 60% of this damage in Chemung, Steuben, and Allegany counties. (Merritt - FIRL)
W74-09496

ECONOMIC IMPACT OF FWPCA WATER EFFLUENT STANDARDS AND GOALS.
Paper Trade Journal, Vol 158, No 13, p 34-38, April 1, 1974. 5 tab.

Descriptors: *Economic impact, *Federal Water Pollution Control Act, *Pulp and paper industry, Water quality, Effluents, Operating costs, Capital costs, Prices, Unemployment, Mills, Energy.
Identifiers: *Amendments, Balance of payments.

The national economic impact of the Federal Water Pollution Control Act Amendments on the paper industry in meeting the water effluent standards and goals is discussed. A survey was conducted to estimate the additional capital and operating costs that the existing paper industry would have to incur to achieve the two assumed water effluent control levels. The water effluent control costs over the range of mill sizes in each product category were compared with current product prices, anticipated profit margins for high cost mills, and the costs of competing foreign mills. It is estimated that $1,200 million will have to be spent for additional capital expenditures. It is estimated the average incremental operating cost for best practical control would increase from $4.50/ton average to $6.00/ton in 1977. There will be several inflationary effects in water effluent control expenditures especially during periods of tight supply/demand. Pulp and paper price increases to the consumer are expected to amount to 7.5-11% at the best practical control level and 19-

62% at the zero discharge level, depending on the product. Other effects include mill closure and unemployment, increased energy use, and impact on balance of payments. (Merritt - FIRL)

SEWAGE AND STORMS GET THE FULL TREATMENT,
R. J. Ganley.
Water and Wastes Engineering, Vol 11, No 1, p 30-31, 37, January, 1974.

Descriptors: *Waste water treatment, Sewage, *Sewage treatment, *Storm water, *New York, Activated sludge, Municipal wastes, *Treatment facilities.
Identifiers: *Catskill(N.Y.)

The construction of a $2.2 million sewage treatment plant capable of handling both storm and sanitary discharges in Catskill, New York, is described. A trickling plant was proposed with modifications to include the use of pre-aeration tanks equipped for the return of activated sludge, and a recirculation pumping rate controlled inversely to the raw sewage inflow rate. The plant can achieve 90-95 percent BOD removal through the use of high rate activated sludge pretreatment, and flow regulation to the primary tanks and trickling filters. The instrumentation and variable speed pumping equipment combining raw with recirculated sewage help provide the desirable constant flow rate to the primary settling tanks and trickling filters. The plant capacity of 1.5 mgd allows for the present Catskill population and its projected growth requirements. The plant is designed to allow a flow, including recirculation, of 3.8 mgd to pass through the primary clarifier and trickling filters before any of the flow is restricted to the filters and bypassed to the final clarifier. To avoid upsetting aerated pretreatment, the pretreated portion of the flow is restricted to approximately 50 percent of the dry weather flow which allows maintenance of the filterability of the raw sludge on the vacuum filters. The plant's raw sewage pumping capacity is 9.0 mgd. (Merritt - FIRL)

AGRICULTURAL WASTE MANAGEMENT,
Oregon State Univ., Corvallis. Dept. of Agricultural Engineering.
J. R. Miner.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 100, No EE2, Paper 10470 p 363-368, April, 1974.

Descriptors: *Civil engineering, *Farm wastes, *Farm management, *Waste storage, *Waste disposal, Chemical wastes, Waste treatment, Water pollution sources, Pollution abatement, *Waste water treatment.

The role of civil engineering in the management of agricultural wastes is discussed. The problems with agricultural wastes are different from those commonly encountered in the management of municipal wastes. Serious problems have resulted when municipal waste technology has been transferred to the management of agricultural wastes without due consideration for the differences of generation characteristics and chemical characteristics of the waste materials. The management of animal manures requires the utilization of a system that somehow resolves the problems of separation of the manure from the animal, transport, storage or treatment or both and disposal. Under current technology, application to cropland is the most widely practiced disposal method. Treatment is for the purpose of making the manure more amenable to cropland application or for the purpose of changing its physical and chemical characteristics to avoid application difficulties or nuisances attributable to the application. SOME HISTORICAL STATISTICS RELATED TO FUTURE STANDARDS,
Wisconsin Univ., Madison.
P. M. Berthouex.
Journal of the Environmental Engineering Division, American Society of Civil Engineers Vol 100, No EE2, Paper 10468 p 423-437, April, 1974. 13 fig, 2 tab, 7 ref.

Descriptors: *Water quality standards, *Treatment facilities, *Construction, *Engineer estimates, *Forecasting, Design standards, Population, Statistical methods, Control, *Standards.

Areas of uncertainity that have relevance in the current water quality standards are discussed including treatment plant construction dilemma and the lack of precision in the language of the standards. Population and demand for forecasting have always added an unavoidable element of risk, but it is very possible that changing standards are the factor most likely to force redesign before the end of the intended design period. If control programs based on rational statistical methods are ever to be developed, it is necessary for effluent target levels and permissible variation to be clearly defined. In doing so, allowance should be made for natural variations and for analytical errors. Possible skewness in the distribution of results should also be noted and given consideration. When both a mean and upper performance level are set, the mean may be redundant if care is not taken to make the two levels consistent. This problem of consistency could be avoided most easily by simply using a 95% upper bound as the standard. (Merritt - FIRL)

CONTROL OF BIOLOGICAL SOLIDS CONCENTRATION IN EXTENDED AERATION,
Cornell Univ., Ithaca, N.Y.
P-Y. Yang, and A. F. Gaudy Jr.
Journal of Water Pollution Control Federation, Vol 46, No 3, p 543-553, March, 1974. 10 fig, 2 tab, 7 ref. OWRR A-017-OKLA(2) + A-035-OKLA(2).

Descriptors: *Pilot plants, *Activated sludge, *Aeration, Recycling, Carbohydrates, Solids, Biomass, Hydrolysis, Waste water treatment.
Identifiers: Sludge proteins, Biological solids, Hydrolytic assist.

A 200-day test period showed that extended aeration activated sludge process with total sludge recycle can be operated successfully using hydrolytic assist to control the mixed liquor biological solids concentration. Thus, the process was made independent of natural periods of accumulation and de-accumulation of biological solids and showed a good ability to accept shock loading. Sludge carbohydrate and protein were within ranges indicating a metabolically active biomass, and the unit respiration activity of the sludge (endogenous 02 uptake values) was slightly higher than that obtained using total cell recycle without hydrolytic assist. Pilot plant operation using the process is still in progress to provide design and operating guidelines. (Prague-FIRL)

IRON REMOVAL IN MUNICIPAL TREATMENT PLANTS,
S. R. Goswami.
Water and Sewage Works, Vol 120, No 10, p 52-55, 82-84, October, 1973. 7 fig, 2 tab, 7 ref.

Descriptors: Treatment, *Groundwater, *Iron, *Waste water treatment, Municipal water, *Monitoring, *Oxidation-reduction potential.

The presence of iron in groundwater and through the various stages of treatment in selected municipal water treatment plants was related to data obtained in field studies at the same locations. Experimental parameters measured were pH, oxidation-reduction potential (Eh), temperature, alkalinity, dissolved oxygen, ferrous, filterable ferrous, and total iron. Field data at particular raw water wells and operational data of raw, aerated, filtered, and softened waters of municipal treatment plants treating iron-bearing groundwaters were compiled. The ranges of Eh for raw and aerated waters of treatment plants treating iron-bearing groundwaters are between 180 to 370 mv and 380 to 500 mv, respectively. The Eh is considerably increased by chlorination at any stage of treatment. The range of ferrous iron concentration varied from 1.30 to 9.09 mg. The Eh appears to be a useful analytical test in controlling the various stages of treatment of iron bearing groundwaters. There is a general correlation between the increase in Eh with decrease in filterable ferrous iron content. The variation of Eh from raw to finished water is an excellent parameter indicating the efficiency of treatment processes. The Eh measurements could be incorporated in the water treatment plants as an automatic monitoring device as used in waste treatment plants. (Merrill-FIRL)

STUDIES ON THE SUITABILITY OF MICROS TRAINERS FOR THE REMOVAL OF SUSPENDED MATTER FROM BIOLOGICAL CLEARING FACILITY EFFLUENT (UNTERSUCHUNGEN UEBER DIE EIGNUNG DES MIKROSIEBES ZUR ENTNAHME SUSPENDIERTER STOFFE AUS DEN ABLAEUFEN BIOLOGISCHER KLAERANLAGEN),
B. Hanisch.
Schweizerische Bauzeitung, Vol 91, No 39, p 94(949, September, 1973. 6 fig, 2 ref.

Descriptors: *Filters, *Separation technique, Bacteria, Suspended solids, Treatment, *Waste water treatment.
Identifiers: *Microstrainers.

Microstrainers for the removal of suspended matter from biological wastewater treatment plant effluents, and experiments with such microstrainers, are described. Microstrainers constitute horizontal rotary drums with very fine steel wire mesh of 23 or 35 microns on their surfaces through which the purified effluent passes from the inside to the outside. The retained particles form a filter layer on the inside of the drum, and thus help retain very small suspended particles. Zoogleal bacteria are controlled by UV irradiation. The strainer resistance, i.e., the water level difference between the inside and the outside of the drum ranges from 10 to 15 cm. Experiments with a microstrainer on the removal of suspended matter from biological wastewater treatment plant effluents revealed a retention efficiency of 33 percent from an effluent mixed return sludge, and a BOD5 reduction of 26-73 percent. Purified effluents from a percolation filter, passed through a microstrainer, experienced a reduction in the suspended matter content from 26-164 mg/liter to 5-36 mg/liter, and a BOD5 reduction from about 110 mg/liter to less than 25 mg/liter. The strainer efficiency and the optimum operating parameters such as the rotational and peripheral speeds, strainer resistance, and flushing water expenditure, are basically determined by the properties of the suspended matter and of the strainer fabric. BETTER STORM DRAINAGE FACILITIES--AT LOWER COST,
H. G. Poetner.
Civil Engineering-American Society of Civil Engineers, Vol 43, No 10, p 67-70, October, 1973. 2 fig.

Descriptors: *Water storage, Storm water, *Storm runoff, Drainage systems, *Reservoir storage, Missouri, Missouri River, Illinois, Colorado, *Recreation, *Treatment facilities, Waste water treatment.
Identifiers: Indian Lake Estates, Denver, Melvina Ditch Reservoir.

Successful and economical applications of detention facilities for stormwater are described for use in open spaces, parking lots and rooftops. The design of the stormwater drainage system at Indian Lakes Estates in Illinois is illustrated. Two lakes detain stormwater runoff and make the area more attractive. One of the lakes is manmade and its existence has increased property value for adjoining acreage. In Earth City, Missouri, the Missouri River bottomland was developed with intersecting finger lakes providing stormwater detention. The lakes are an esthetic and recreational asset to the community. A specially designed ponding ring surrounds a roof drain conductor head on some buildings in Denver. The device slows runoff and is used for rainfall detention on the roof. In the layout of Melvina Ditch reservoir, a paved area prevents erosion at the inlet, and is used for recreational purposes. (Merritt-FIRL)

ALUMINUM PIT DOORS PROVIDE EASY ACCESS TO A RETENTION BASIN.
Water and Sewage Works, Vol 20, No 10, p 62-63, October, 1973.

Descriptors: *Storm drains, *Michigan, *Storm waters, Storage, Water storage, *Retention, Waste water treatment.
Identifiers: *Aluminum doors, *Narren(Mich).

The use of aluminum pit doors to provide easy access to the 50 million gallon underground stormwater retention basin in Warren, Michigan is discussed. The 42 heavy plate doors float on compression spring operators and automatically lock open, providing safety and easy handling. The five foot pit doors are completely watertight and provide a flush surface for walkover traffic. The channel frames trap surface water which is directed to a drywell. Doors are built for a minimum live load of 300 psf. The lock opens at 90 degrees, but can be released with one hand. The two large, special size roof scuttles were installed to permit installation and removal of large equipment. (Merritt-FIRL)
W74-09515

HOW TRIPLE SIPHON SOLVED SEWAGE TRANSFER ACROSS WELLAND RIVER,
L. Webster.
Engineering and Contract Record, Vol 88, No 10, p 54-55, October, 1973.

Descriptors: Rivers, *Canada, *Sanitary engineering, Treatment, Disposal, Plastics, *Plastic paper, Waste water treatment, *Siphons, *Sewers.
Identifiers: *Welland River(Ont), Niagara Falls(Ont).

The use of a novel triple siphon system across the Welland River on Ontario's Niagara Peninsula is described. Sanitary wastes originating on one side of the river are conveyed to the City of Niagara Falls pollution control plant across the river for treatment and disposal. Excavations were required for large manholes on each bank of the river, one to serve as an inlet structure, the other an outlet structure, for the siphons. A dewatering system was designed to secure the excavations against the hydrostatic pressure from the underlying silt layer. The use of polyethylene pipe for the siphons to effect the actual river crossing contributes to a substantial savings over a design calling for the underwater installation of more conventional materials. (Merritt-FIRL)

MAGNETIC CLARIFIER.
Engineering News-Record, Vol 191, No 20, p 23, November 15, 1973.

Descriptors: *Massachusetts, Rivers, Treatment, *Recycling, Sludge, Mining, Iron, *Waste water treatment, Water reuse, Separation technique.
Identifiers: Magnetic clarifier, Apparatus, Magnetic separation, Boston(Mass), *Charles River(Mass), Bottom waters, *Iron filings.

The application of an instream magnetic separation process for cleaning the bottom waters of Boston's Charles River is described. The process has previously been used only in the mining and clay industries. It involves distributing very finely ground iron filings throughout water that has been pumped up through a suction device from the river bottom. Chemicals are added to coagulate the pollutants and iron filings, and to improved the electrolytic property of the water. The water is run through a high intensity electromagnetic field which attracts the solids. The separated material is again put through a magnetic field to recovery iron filings for reuse. The treated water is returned to the river while the sludge is temporarily stored in a barge. (Merritt-FIRL)

THE PHOSPHATE PRECIPITATION IN COMMUNAL WASTE WATERS (DIE PHOSPHATFAELLUNG IN KOMMUNALEM ABWASSER),
Knapsack A. G., Cologne (West Germany).
D. Gleisberg, J. Kandler, and G. Peantek.
Chemie-Ing.-Techn., Vol 45, No 20, p 1225-1226, 1973. 2 fig, 1 tab.

Descriptors: *Phosphates, Treatment, *Biochemical oxygen demand, *Chemical oxygen demand, Water pollution treatment, Treatment facilities, *Anabaena, Algae, *Waste water treatment, *Chemical precipitation, Inhibition.

The possibility of the chemical precipitation of phosphates and of the reduction of the BOD and COD values in municipal wastewater was studied at a wastewater treatment plant serving some 10,000 inhabitants. Precipitation, coprecipitation, and direct precipitation were studied. The precipitant used were aluminum sulfate containing 15 percent alumina, and ferric sulfate with about 43 percent ferric oxide. The precipitation was conducted in a mixing tank. The phosphate:Al and phosphate:iron ratios were set at 1:1.27 and 1:2.4, respectively. The pH value averaged 7.5. Precipitation of 80 percent of the orthophosphate ions in about ten seconds was determined. The efficiency of preprecipitation, coprecipitation, and direct precipitation in terms of phosphorus removal was 97-99 percent, 93-94 percent, and 97-98 percent, while mechanical-biological purification without precipitation has an efficiency of 10 percent only. The reduction in the BOD5 values was 93-99 percent for preprecipitation, 83-88 percent for coprecipitation, and 60-77 percent for direct precipitation, compared to a control value of 94 percent for the case of biological treatment. The corresponding figures for the reduction of the COD were 84-91 percent, 6074 percent, 55-59 percent, and 67 percent. Water samples taken after chemical precipitation of the phosphates, and incubated with Anabaena flos-aquae, considerably inhibited algal growth. (Takacs-FIRL)

MEMBRANE REGENERATION FOR WASTEWATER RECLAMATION USING REVERSE OSMOSIS,
Hebrew Univ., Jerusalem (Israel). Human Environmental Sciences Program.
G. Belfort, F. E. Littman, and H. K. Bishop.
Water Research, Vol 7, No 11, p 1547-1559, 1973. 11 fig, 2 tab, 10 ref.

Descriptors: *Waste water treatment, *Reverse osmosis, *Water reuse, Engineering estimates, Design, Cost analysis, Operating costs, *Membranes.
Identifiers: Reverse osmosis membranes.

An increasingly viable source of water is waste water reclamation. Essential to the treatment process is demineralization. Recently, this task has been accomplished through reverse osmosis but this method is subject to potential plugging and simultaneous product flux-decline of the membranes. While two methods--periodic clearing and extensive pretreatment have been used to correct this problem, the third method described is presently economically feasible and allows for in situ replacement of cellulose acetate membranes. In the regenerable design unit the brine flows on the outside of the tank while the product, permeating the membrane covering, is collected in a reservoir. The degraded membrane is dissolved through pumping acetone into the unit. Coating solutions are then pumped into the unit to form the membrane and subsequent gelling is achieved by pumping ice water through the unit. To test the effectiveness of the methodology, the membrane replacement cycle was repeated six times with average water fluxes of 13 gal/sq ft/day and salt rejections of between 78-85%. Projected membrane costs are reduced from $4.06/sq ft for a 6-in dia module to 8 cent/sq ft for a 72-in dia module making the latter economically attractive. Tests on primary and secondary sewage are presented and design and cost computer parametrization are discussed. (Schroeder-Wisconsin)

SOME CONSERVATION PROBLEMS IN THE METAL-FINISHING INDUSTRY,
Bostock, Hill and Rigby, Birmingham (England).
R. K. Chalmers.
Chemistry and Industry, p 554-557, June 1973. 3 tab, 7 ref.

Descriptors: *Industrial wastes, *Recycling, *Metals, Flow, Effluents, *Waste water treatment, Chemical wastes, Water quality standards.
Identifiers: *Metal finishing wastes.

Losses of high quality process materials in the metal-finishing industry can be lessened by simple measures in the processes to reduce water consumption, effluent discharge volumes, and amounts of contaminants discharged to the drains as well as by water re-use measures. Methods for reducing water consumption are offered and a few examples are cited showing the effectiveness of these methods. Drag-in and drag-out from plating tanks can be minimized by air blasts, drainage techniques, wetting agents, and spray or intermittent rinses as a means of minimizing amounts of contaminants discharged to drains. Some companies involved in the use of large amounts of water are now aiming at 100% water recycle. Conditions necessary for re-use of effluents and approaches to treatment of effluents are listed and recommendations applicable to specific problems are discussed. Effluent standard determination is

mentioned and a list is included of reasonable limits in mg/l of contaminants in receiving waters suited for drinking supplies. (Jernigan-Vanderbilt)

MEMBRANE SCIENCE AND TECHNOLOGY.
Proceedings of Symposium held at the Columbus Laboratories of Battelle Memorial Institute, October 20-21, 1969, Columbus, Ohio: Plenum Press, New York, N.Y., 1970 (second printing 1973). 230 p, $27.00.

Descriptors: *Membranes, *Membrane processes, *Waste water treatment, *Water treatment, Filtration, Reverse osmosis, Water purification, Water reuse, Water pollution control.

A conference on membranes was held at the Columbus Laboratories of Battelle Memorial Institute in Columbus, Ohio, on October 20 and 21, 1969. Membranes are used to fractionate, purify, or concentrate primarily aqueous solutions containing small dissolved ionic and neutral solutes and much higher molecular weight compounds, including proteins, enzymes and viruses. These types of systems present problems which are quite different to those encountered in simple water recovery from sea or brackish water. Cake buildup on the membrane surface, clogging of pores, adsorption in and on the membrane, rheological limitations on the mass transfer of solute and solvent due to viscosity, shear, and non-Newtonian fluid effects, are examples. Many of the papers in this volume deal with or allude to these problems and provide useful insights into their causes and preventions. (See W74-09634 thru W74-09637)

LOW-PRESSURE ULTRAFILTRATION SYSTEMS FOR WASTEWATER CONTAMINANT REMOVAL,
Massachusetts Univ., Amherst., and Iowa Univ., Iowa City.
W. L. Short, R. T. Skrinde, and D. G. Newton, Jr.
In: Membrane Science and Technology; Proceedings of Symposium held at the Columbus Laboratories of Battelle Memorial Institute, October 20-21, 1969, Columbus, Ohio; Plenum Press, New York, N.Y., p 188-195, 1970 (second printing 1973). 3 fig, 2 tab, 16 ref.

Descriptors: *Waste water treatment, *Membrane processes, Filtration, Membranes, Reverse osmosis, Sewage treatment, Pulp wastes.

The membrane process of reverse osmosis, developed initially for use in desalination, is a promising method for treatment of wastewaters. The effect of surfactants was evaluated during low-pressure ultrafiltration of dilute raffinose solutions. The raffinose rejection is essentially independent of surfactant concentration and is, in fact, nearly constant at 80-85 percent. The surfactant, in addition to not altering the raffinose rejection, had no discernible effect on the permeate flux. (See also W74-09633) (Knapp-USGS)
W74-09634

INDUSTRIAL WASTE TREATMENT OPPORTUNITIES FOR REVERSE OSMOSIS,
Eastman Chemical Products, Inc., Kingsport, Tenn. Polymer Technology Div.; and Eastman Chemical Products, Inc., Kingsport, Tenn. Photographic Technology Div.
J. G. Mahoney, M. E. Rowley, and L. E. West.
In: Membrane Science and Technology; Proceedings of Symposium held at the Columbus Laboratories of Battelle Memorial Institute, October 20-21, 1969, Columbus, Ohio: Plenum Press, New York, N.Y, p 196-205, 1970 (second printing 1973). 6 fig, 4 tab, 1 ref.

Descriptors: *Reverse osmosis, *Membrane processes, *Industrial wastes, *Waste water treatment, *Water reuse, Reclaimed water, Byproducts, Chemical wastes, Water pollution control.

Processing industrial wastes by reverse osmosis or ultrafiltration can bring about process economies by recovery of the valuable materials dissolved in the waste stream, by recovery of high quality water for reuse, and by concentration of pollutants for disposal. (See also W74-09633) (Knapp-USGS)

REVERSE OSMOSIS: APPLICATION TO POTATO-STARCH FACTORY WASTE EFFLUENTS,
Agricultural Research Service, Philadelphia, Pa. Eastern Utilities Research and Development Div.
W. L. Porter, J. Siciliano, S. Krulick, and E. G. Heisler.
In: Membrane Science and Technology; Proceedings of Symposium held at the Columbus Laboratories of Battelle Memorial Institute, October 20-21, 1969, Columbus, Ohio: Plenum Press, New York, N.Y., p 220-230, 1970 (second printing 1973). 3 fig, 5 tab, 6 ref.

Descriptors: *Waste water treatment, *Membrane processes, *Reverse osmosis, *Potatoes, *Food processing industry, Proteins, Water reuse, Byproducts.

Secondary wastes from potato-starch processing can be treated by reverse osmosis. This material contains protein, free amino acids, organic acids, sugars, inorganic ions, and other compounds. The output of this waste from a 30-ton-per-day starch plant is about 300 gpm or about 432,000 gallons per day. The solids content is about 0.5 to 1.0 percent, and it has a COD requirement of approximately 9000-14000 mg per liter. This is equivalent to a city of approximately 85,000 people, with respect to waste-disposal potential. The proteins and amino acids have been shown to contain more than adequate amounts of lysine and methionine for human and animal nutrition and, as such, have considerable value as additives to grain products. In a pilot test, the recovered water was pure enough for reuse. The best choice of the three types of membranes tested was the one of medium porosity. This conclusion was based upon the relationships between flux, retention of desirable waste-water constituents, and reduction of COD. (See also W74-09633) (Knapp-USGS)

OPTIMAL CONTROL OF FLOW IN COMBINED SEWER SYSTEMS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
P. W. W. Bell.
Available from the National Technical Information Service as PB-233 668, $6.50 in paper copy, $1.45 in microfiche. Partial Completion Report, Metropolitan Water Intelligence Systems, Technical Report No 12, May, 1974. 232 p, 40 fig, 21 tab, 30 ref, 6 append. OWRR C-4172(No 9028)(1).

Descriptors: *Control systems, *Sewers, *Storm runoff, *Overflow, *Optimization, Water pollution control, Operations research, Storage, Detention, Reservoir operation, Mathematical models, Algorithms, Computer applications, Systems engineering, Automatic control, Nonlinear systems.
Identifiers: *Combined sewer systems, *Mathematical programming, Optimal control theory, Nonlinear programming.

The development of a suitable control logic for the real time control of flow in combined sewer systems is examined. The approach followed is based on continuous time optimal control theory. The combined sewer system is modelled as a series of interconnected reservoirs having both weir and orifice controls. The objective function chosen is that of minimizing weighted flow diversions from the system. The problem of numerical solution of the necessary conditions is examined and it is concluded that in general their solution is too cumbersome for practical use. An alternative control solution is proposed, based on operating rules derived from the common factors shown to exist in the previously examined solution forms. Results of application of this technique to systems of four reservoirs and ten reservoirs are presented. A further example is presented showing the effects of information errors on the true optimality of a computed control strategy. Finally, the necessary modifications to the necessary conditions for an optimal control in which there are time delays in the flow routing are presented. It appears that the approach outlined is a feasible solution to the problem of real time control of flow in combined sewers.

WASTEWATER RECLAMATION: SOCIO-ECONOMICS, TECHNOLOGY, AND PUBLIC ACCEPTANCE.
Ralph Stone and Company, Inc., Los Angeles, California.
Available from the National Technical Information Service as PB-233 675, $6.00 in paper copy, $1.45 in microfiche. Completion Report, May 1974. 302 p, 21 fig, 98 tab, 90 ref, 7 append. OWRR C-4030(No 9007)(1).

Descriptors: Reclamation, *Attitudes, *Economic feasibility, *Waste water treatment, Public health, *California, *Water reuse.
Identifiers: *Burbank(Calif).

The social, economic, technical and attitudinal aspects of wastewater reclamation were examined for various consumptive uses. Attitudes surveys of 100 randomly-selected residents in each of ten Southern California communities revealed consumer acceptance for non-body contact uses, neutral to accepting attitudes towards body contact uses, and neutral to rejecting attitudes for direct human consumption uses. The strongest public objection to wastewater reuse was psychological repugnance; other correlations of public attitudes were examined. Surveys of water resources public officials and experts and industrial management revealed attitudes towards reuse generally similar to the public's; officials tended to grossly overestimate public rejection of wastewater reclamation. Public health, water quality and other technical aspects of reclaiming wastewater were evaluated. Recommended treatment processes for various reuses were given. A cost-benefit model was presented for determining the overall socio-economic feasibility of reclaiming wastewater for a variety of alternative uses, taking into account differing local constraints likely to be encountered. The model was applied to the City of Burbank, California as a case study.

PYROLYSIS AS A METHOD OF DISPOSAL OF CATTLE FEEDLOT WASTES,
Midwest Research Inst., Kansas City, Mo.
W. Garner, C. E. Bricker, T. L. Ferguson, C. J. W. Wiegand, and A. D. McElroy.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 101-123 (1972). 7 fig, 5 tab, 10 ref.

Descriptors: *Farm wastes, *Waste disposal, *Feed lots, *Cattle, *Cost analysis, Cellulose, Lignin, Differential thermal analysis.
Identifiers: *Pyrolysis, Hemicellulose, Thermogravimetric analysis, Organic fractions.

A program was conducted to determine the economic feasibility of pyrolyzing feedlot wastes. Background theory on pyrolysis of cellulose, hemicellulose and lignin, and wood is given. The pyrolysis process is described and test results are given. Composition of noncondensables, elemental analyses, material and energy balance, and economic evaluation of a pyrolyzer for manure from a 40,000 head beef cattle feedlot are given. The conclusion was that pyrolysis of feedlot wastes was uneconomical in relation to simple incineration because cost of equipment to separate potential marketable material was not offset by the market value of the materials. DAIRY MANURE WASTE HANDLING SYSTEMS,
A. Grimm.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 125-144 (1972). 1 fig, 3 tab, 7 ref.

Descriptors: *Dairy industry, *Waste disposal, *Waste treatment, Aeration, Activated sludge, Incineration, Cattle, *California, *Farm wastes.
Identifiers: Dairy manure, *Waste handling systems, Centralized dairies, Decentralized dairies, Dirt corrals, Paved corrals, Direct disposal, Dewater solids, Compost, Liquid flush, Oxidation ditch, Dairymen's Fertilizer Cooperative, Pyrolysis, Southern California, Cerritos, California.

Because of complete urbanization of such areas as Cerritos, California, a program was initiated in southern California to study and demonstrate improved methods of handling raw manures at individual dairies and feedlots in highly populated areas. Individual systems costs are presented. Evaluations were made for ten decentralized individual dairy waste handling systems: Four for a dirt corral dairy and six for a paved corral dairy. Eight centralized, regional dairy waste handling systems were analyzed. A comparison is presented of environmental effects of waste handling systems and system operating cost. Conclusions were: (1) disposal of manure from each decentralized dairy should be accomplished in the most economical manner with the least detrimental environmental effect, and (2) in view of a diminishing number of dairies, construction and operation of a centralized waste disposal plant did not appear justified in the Cerritos area. (See also W74-09663) (Marquard-East Central)
W74-09674

AERATION RATES FOR RAPID COMPOSTING OF DAIRY MANURE,
G. B. Willson, and J. W. Hummel.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 145-158 (1972). 12 fig, 2 tab, 9 ref.

Descriptors: *Dairy industry, *Farm wastes, Chemical oxygen demand, Nitrates, Ammonia, *Waste treatment, *Aeration.
Identifiers: *Composting, Aeration rates, Bench composter, Bin composter, Mechanized channel, Oxygen consumption rate.

Studies were undertaken to develop design criteria for composting operations. Bench composters, bin composters, and a mechanized channel were the three methods used for development of aeration rates. A generalized curve was developed showing the effects of aeration on temperature and rate of oxygen consumption at any one time during the process. Aeration rates should vary in the process in the following sequence: (1) during warmup stage, aeration should be applied at increasing rates; (2) when thermophilic temperature is reached the aeration rate should be increased to the top of the temperature limit; and (3) as the level of activity decreases the rate of aeration should be reduced to prevent cooling. (See also W74-09663) (Marquard-East Central)
W74-09675

WINDROW COMPOSTING OF SWINE WASTES,
Cornell Univ., Ithaca, N.Y.
J. H. Martin, Jr., M. Decker, Jr., and K. C. Das.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 159-172 (1972). 10 fig, 5 tab, 7 ref.

Descriptors: *Hogs, *Waste treatment, Hydrogen ion concentration, *Farm wastes.
Identifiers: *Composting, *Swine wastes, Windrow, Thermophilic environment, Adulteration.

A study was performed to determine the feasibility of composting swine wastes. Criteria for evaluation were control of odors, time required for stabilization, volume reduction, and characteristics of the end product. Evaluation of the composting process was accomplished in two phases: (1) windrow formation creating aerobic conditions conducive to thermophilic activity and (2) maintenance of conditions for rapid stabilization. The findings were: (1) a direct correlation was observed between odor control and development of thermophilic environment; (2) increasing the turning frequency had a significant effect on the composting process; (3) adulteration of the material was successful in reducing the time before odors were controlled and minimizing time for completion when straw was used; (4) volume reduction and final material were satisfactory, and (5) composting can be a satisfactory method for treating swine manure and provides an alternative to liquid systems. (See also W74-09663) (Marquard-East Central)
W74-09676

REDUCTION IN MOISTURE AND DAILY REMOVAL OF WASTES FROM CAGED LAYING HENS,
West Virginia Univ., Morgantown.
A. D. Longhouse.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 173-185 (1972). 9 fig, 6 tab.

Descriptors: *Poultry, *Farm wastes, *Waste disposal, Ammonia, *Waste treatment, Odor, Forced drying.
Identifiers: Caged laying hens, Moisture reduction, Vertically tiered cages, Dryer conveyor, Dropping boards, Scraper.

Research objectives were to remove manure daily from laying hens in vertically tiered cages and to begin moisture removal promptly, thus preventing odor development (especially of ammonia) and restricting vectors. The research facility was equipped with a dryer-conveyor, dropping boards, a scraper mechanism, and an automatic control for solenoid steam valve. Construction design is illustrated. Results of a five-day test are tabulated. The research, at this time, indicates that it is possible to eliminate odors and flies in a poultry house when the manure is removed at least once daily, thus making it possible to increase the bird population 25 to 100 percent - thereby paying for added mechanization. (See also W74-09663) (Marquard-East Central)
W74-09677

UNDERCAGE DRYING OF LAYING HEN MANURE,
Cornell Univ., Ithaca, N.Y.
A. T. Sobel.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 187-200 (1972). 12 fig, 2 tab, 3 ref.

Descriptors: *Forced drying, *Farm wastes, *Poultry, Attractants, *Waste disposal, Odor, Particle size, Particle shape, Temperature, *Waste treatment.
Identifiers: Undercage drying, Laying hen manure, Fins, Screens, Slot outlets, Air velocity, High-rise laying house, Bird concentration.

Two systems for undercage drying of chicken manure were investigated. The first system employed mechanical devices and no forced air. Test results indicated metal fins placed at angles beneath cages offer more efficient drying than mesh screen. Percentage results of various angles are listed. The second system utilized forced air drying in bird rooms with slot outlets and a high rise laying house. This was the only system studied on a full size field operation. An average drying curve for undercage drying with forced air and slot outlets and a summary of moisture contents obtained for various undercage drying systems are presented. Observations indicate (1) the high-rise house presented the largest range of moisture contents, (2) shallow bed system (forced air) presented the smallest range of moisture, and (3) all systems removed moisture to moisture contents below 60 percent. (See also W74-09663) (Marquard-East Central)
W74-09678

STORAGE OF MANURE SOLIDS BY FORMING SOIL-MANURE PELLETS,
Iowa State Univ., Ames.
R. D. Larson, T. E. Hazen, and J. R. Miner.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 201-210 (1972). 5 fig, 5 tab, 5 ref.

Descriptors: Hydraulic transportation, *Farm wastes, *Waste storage, Moisture content, Physical properties, Hydrogen ion concentration, Nitrogen, Carbon dioxide, Ammonia, *Waste treatment, Dewatering.
Identifiers: *Soil-manure pellets, Hydrated lime, Webster silty clay loam, Volitalization.

Moisture content, pH effects and nitrogen/CO2 evolution in the pelleting process of animal manure are described. Soil and lime are added to manure solids to help produce pellets. Soil is used as a dewatering and binding agent to control moisture content and lime is used to increase pH. Nitrogen/CO2 evolution is tested by 5 and 10% lime treatments. Conclusions are: (1) Addition of lime increases ammonia loss from a soil, lime and manure mixture; the rate of evolution increases significantly above pH 11. Moisture content does not greatly effect rate of evolution. (2) Biological activity, represented by carbon volatilization increases with the addition of 2.5% d.b. hydrated lime. Further lime additions decrease activity. At the 10% lime level, growth is arrested. Little or no growth occurs above pH 9. In most treatments, moisture-content increases were accompanied by marginal increases in carbon-dioxide evolution. (3) Manure solids exhibit a buffering capacity. The solids have an ability to retard pH increases with increasing lime contents. A pH range from 9 to 11 would be desirable in order to mutually minimize ammonia and carbon evolution. AUTOMATED HYDRAULIC WASTE-HANDLING SYSTEM FOR A 700-HEAD SWINE FACILITY USING RECIRCULATED WATER,
Iowa State Univ., Ames.
J. K. Koelliker, J. R. Miner, T. E. Hazen, H. L. Person, and R. J. Smith.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 249-261 (1972). 8 fig, 1 tab, 6 ref.

Descriptors: *Hogs, *Recirculated water, *Farm wastes, *Waste storage, *Waste disposal, Irrigation, Estimated costs, *Iowa, *Waste water treatment, Water reuse.
Identifiers: Automated hydraulic waste-handling system, Flush tanks, Sewer lines, Anaerobic lagoon, Return water system, Slatted floors.

A swine waste handling system is described that for four years has operated with little attention, no handling of manure, low odors, and no effluent discharge into streams. The system uses an enclosed building in which swine waste is deposited into gutters. Flush tanks automatically flush the water into sewer lines and then to an anaerobic lagoon. From here some waste goes into the irrigation system for land disposal and lagoon effluent is returned to the flush tanks. Investment in the entire manure management system is estimated at $10-$15 per hog capacity. Detailed description and costs of the system are given. (See also W74-09663) (Marquard-East Central)
W74-09682

OPERATIONAL PROBLEMS OF PORK PRODUCTION RELATED TO ENVIRONMENTAL QUALITY,
A. E. Gehlbach.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 263-265 (1972).

Descriptors: *Hogs, *Farm wastes, *Waste disposal, Confinement pens, Oxidation lagoons, Lagoons, *Waste water treatment.
Identifiers: *Environmental quality, Operational problems, *Soil injection, Pasture system, Collection pits.

A comparison is made of two pork production systems - the pasture system and the confinement system. An operational problem of the pasture system is that heavy rains wash runoff into streams. The confinement system can prevent this and can dispose of waste in these ways: (1) collection pits, (2) oxidation ditches, (3) lagoons. Problems of these are costs and inability to use them year round. Gehlbach Swine Farms uses soil injection to prevent runoff and odor; however, research is needed to solve these waste disposal problems: (1) find limits of animal waste applications to land, (2) prevent odor from swine buildings and (3) find proper operating procedures for lagoons. (See also W74-09663) (Marquard-East Central)
W74-09683

TREATMENT OF SWINE WASTES,
L. R. Schuster.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 267-270 (1972).

Descriptors: *Hogs, *Farm wastes, *Waste treatment, Confinement pens, Poultry, Biochemical oxygen demand, Costs, *Aeration.
Identifiers: Tank-aerator.

The swine aerator system was chosen as a means of waste treatment for the following reasons: (1) Closed loop with zero runoff, (2) Adaptability to existing facility, (3) Ready accessibility for maintenance, (4) Ease of operations. Tank design and aeration rates are given for a 100 sow operation. Water area of the system is 18x38x10 ft. Waste containing a five day biochemical oxygen demand of 33,000 mg/l and an oxygen uptake rate of 43 mg/l/hr. requires transfer of 21.5 lbs of oxygen per hour at 20 degrees centigrade. Pumps must be capable of pumping at least 635,000 gal/hr., or the equivalent of turning over the tanks content once every 4.7 minutes. Costs and savings through use of such a system are discussed. (See also W74-09663) (Marquard-East Central)
W74-09684

AN EVALUATION OF THREE HYDRAULIC MANURE TRANSPORT TREATMENT SYSTEMS, INCLUDING A ROTATING BIOLOGICAL CONTACTOR, LAGOONS AND SURFACE AERATORS,
Iowa State Univ., Ames.
H. L. Person, and J. R. Miner.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 271-288 (1972). 5 fig, 9 tab, 1 ref.

Descriptors: *Hogs, *Farm wastes, *Waste treatment, *Waste water treatment, Lagoons, Confinement pens, Nitrogen, Ammonia, Rotating biological contactor, Chemical oxygen demand, Biochemical oxygen demand, Effluent, Iowa.
Identifiers: *Hydraulic manure transport systems, Anaerobic lagoon, Aeration basin, Recycled water, Flushing gutters, Surface aerators, Bilsland Memorial Research Station.

Three different waste treatment systems that use flushing gutters and recycled treated waste waters for cleaning are reported. System 1 uses flushing gutters and an aeration basin; system 2 uses flushing gutters, an anaerobic lagoon and an aeration basin; and system 3 uses flushing gutters, an anaerobic lagoon and a rotating biological contactor. Each system is diagramed and specific details and dimensions are given. Effectiveness of the three systems in terms of effluent control is summarized. It was found that (1) discharging effluent down flushing gutters was an effective means of removing manure from swine buildings, (2) treated effleunt did not inhibit normal swine growth, (3) recycled wastes did not cause excessive odor problems, (4) the effluent from the RBC system and lagoon, aeration-basin system presented a few

pumping problems, and (5) the aeration-basin effluent contained more solids and had clogged return lines more frequently. (See also W74-09663) (Marquard-East Central)
W74-09685

DRYING POULTRY MANURE AND REFEEDING THE END PRODUCT,
J. F. Bergdoll.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 289-293 (1972).

Descriptors: *Poultry, *Farm wastes, *Recycling, Nitrogen, Costs, Nutrients, Odor, Fertilizers, *Indiana, *Drying, *Waste treatment.
Identifiers: Refeeding, Dried poultry manure.

Berry Best Egg Company's program for drying poultry manure into a feed is reported. The manure is dried to a 10-15% moisture content. No odor is reported when 10% level is reached; however, from the 12-15% moisture level, there is a slight smell. Cost for a dryer runs from $22,000 to $70,000 and total operational costs run from $15 to $35 per ton. Nutrient Value/Nitrogen is highest when manure is dried daily. Optimum level for waste in a feed ration is 10 to 15%; however, it is recommended that birds should start eating a ration at eight weeks of age and work up to a 30% level. Egg production results are given. (See also W74-09663) (Marquard-East Central)
W74-09686

THE EFFECTS OF CONTINUOUS RECYCLING AND STORAGE ON NUTRIENT QUALITY OF DEHYDRATED POULTRY WASTE (DPW),
Michigan State Univ., East Lansing.
C. J. Flegal, C. C. Sheppard, and D. A. Dorn.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 295-300 (1972). 5 tab, 5 ref.

Descriptors: *Poultry, *Farm wastes, *Waste storage, *Nutrients, Calcium, Phosphorus, Nitrogen, *Recycling, *Waste treatment.
Identifiers: Continuous recycling, Dehydrated poultry wastes, Crude protein.

One experiment was conducted to determine the influence of poultry waste storage time on the nutrient quality of dried poultry wastes. Another experiment tested what continuous recycling does to dried poultry waste nutrient quality. In the first experiment, droppings were collected and stored prior to drying from periods ranging from 1 to 90 days. In general, when the material was held for longer than 28 days, crude protein content went down. In experiment 2, pullets were fed rations for 412 days. The diets containing DPW were continuously recycled. At the completion of 31 cycles, the proximate analyses of the DPW from the birds fed the continually recycled DPW were quite similar to prior results. However, both calcium and phosphorus were slightly higher than DPW from hens fed a standard cage laying ration. Hen housed egg production of the birds fed the 12.5 percent DPW diet was slightly higher than the hen housed egg production of the other birds. Birds fed the diet containing 25 percent DPW consumed the most feed. Mortality of the birds fed the three diets ranged from 6.9 percent to 7.9 percent. (See also W74-09663) (Marquard-East Central)
W74-09687

EVALUATION OF DEHYDRATED POULTRY MANURE AS A POTENTIAL POULTRY FEED INGREDIENT,
Cornell Univ., Ithaca, N.Y.
M. C. Nesheim.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 301-309 (1972). 7 tab, 6 ref.

Descriptors: *Poultry, *Farm wastes, *Feeds, *Recycling, Evaluation, Economics, Amino acids, Phosphorus, *Waste treatment.
Identifiers: Refeeding, Dehydrated poultry manure, Metabolizable energy, Egg production, Feed consumption.

Experiments were made to evaluate poultry waste as a poultry feed ingredient. The metabolizable energy content of the poultry waste was considered the best single overall measure of its potential value as a feed ingredient. Test hens were fed computer formulated rations of which diets 1, 2, and 4 were of low energy content while diet 3 was a typical commercial energy diet. Diets 1 and 4 had 22.5% poultry waste as an ingredient of their rations. Results revealed that egg production was high for all four diets; however, hens on diets 1, 2, and 4 ate more than those on diet 3. There was also a marked increase in excreta dry matter for these hens. This indicated that only a portion of the manure was actually lost in recycling. The computer analysis indicated that poultry waste would be used as a preferred source of phosphorus in the ration until it reached a cost of $26.00 a ton with the feed ingredients used. Its high phosphorus content along with the associated amino acids and energy made it a preferred source of phosphorus in the ration compared to meat meal and decalcium phosphate. OPERATIONAL PROBLEMS OF POULTRY PRODUCTION RELATED TO ENVIRONMENTAL QUALITY,
H. J. Kreher.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 311-316 (1972).

Descriptors: *Waste disposal, *Poultry, *Air pollution, *Odor, *Legal aspects, Technology, Ozone, *New York, *Waste water treatment.
Identifiers: Operational problems, Environmental quality, Liquid manure spreader, Soil injection.

Waste disposal is the main operational problem of Kreher Poultry Farms, a 60,000 hen poultry farm in New York. When land disposal of liquid manure became objectionable to a nearby population, ozone treatment was used to reduce odors. Due to maintenance breakdowns, the odors persisted and the farm owners were taken to court. The owners were faced with a $200 settlement for their violations. These owners feel that this was an unfair judgement and that there is a desperate need for an objective third party - an agriculture industry panel made up of people acquainted with agricultural problems and agricultural research. Such a council could give sound recommendations to farmers in trouble. (See also W74-09663) (Marquard-East Central)
W74-09689

AUTOMATED HANDLING AND TREATMENT OF SWINE WASTES,
Ohio State Univ., Columbus.
E. P. Taiganides, and R. K. White.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 331-339 (1972). 12 fig.

Descriptors: *Hogs, *Farm wastes, *Waste water treatment, *Oxidation lagoons, Odor, Automation.
Identifiers: *Automated handling, Flushing gutters, Recycled waste water, Siphon tanks.

A plant was constructed on Botkins Feed and Grain Company Research Farm, Botkins, Ohio, in order to study the feasibility of automatically removing swine wastes, treating them, and recycling treated effluent back to the building to flush out further wastes. The plant operated as follows. A tank located at the end of the gutter was filled with water which was siphoned onto the gutter. The flushing water carried the dung defecated on the gutter to a sump from where the waste water was pumped onto a stainless steel screen. At the screen, the solids were separated from the liquids. Liquids were discharged into the oxidation ditch, clarified, and the supernatant from the final clarifier was pumped back into the siphon tanks in the animal building. Meanwhile the solids separated by the screen were aerobically digested, stored, and pumped on crop land. After twenty weeks of operation the automated removal of waste was working extremely well and odor control was good, but the oxidation ditch was malfunctioning and foaming. At the time of this report, it was hoped that the system would be monitored two more years and that procedures would be developed to make the plant operate optimally at all times. W74-09690

EVALUATION OF SWINE WASTE TREATMENT ALTERNATIVES,
North Carolina State Univ., Raleigh.
F. J. Humenik, R. W. Skaggs, C. R. Willey, and D. Huisingh.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 341-352, (1972). 1 fig, 11 tab, 6 ref.

Descriptors: *Hogs, *Farm wastes, *Waste water treatment, *Evaluation, *Waste disposal, Nitrogen, Chemical oxygen demand, Phosphorus, Heavy metals.
Identifiers: *Land disposal, Unaerated lagoons, Application rates, Cecil sandy loam, Norfolk sandy loam.

The treatment of swine waste by a single unaerated lagoon, the treatment of swine waste by an unaerated series lagoon system, and data for land disposal of effluent from a single unaerated lagoon are described. The experiment revealed that an unaerated series lagoon can handle twice the number of animals that a single aerated lagoon can take care of and there is no increase in odor. Specific conclusions were: (1) Major constraints in using lagoon systems in the Southeast are the disposal of excess liquid and the potential of odor and excess leakage. (2) A conservative estimate of allowable nitrogen loading when using land disposal of wastes in the Southeast appears to be 15 lb/acre/week for Cecil sandy loam and 10 lb/acre/week for Norfolk sandy loam. (3) Heavy metal feed additives can pose an environmental and health hazard, i.e. the copper content of the soil-plant disposal system may approach levels that poison the soil and/or are toxic for sheep and other animals. However, lagoons can be utilized as a copper trap prior to land disposal. (See also W74-09663) (Marquard-East Central)
W74-09691

DEVELOPMENT OF A SYSTEM AND A METHOD FOR THE TREATMENT OF RUNOFF FROM CATTLE HOLDING AREAS,
Kappe Associates, Inc., Rockville, Md.
D. S. Kappe.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 353-363, (1972). 2 fig, 2 tab.

Descriptors: *Waste water treatment, *Farm wastes, *Agricultural runoff, Waste treatment, *Waste disposal, Cattle, Dairies, *Confinement pens, Aerobic treatment, Anaerobic conditions, Sludge, Hydrogen ion concentration, Chemical properties, Economics, Maryland.
Identifiers: *Waste management research, *Aeration tank.

Kappe Associates Inc. and J. L. Mills Brooklawn Dairy Farm have completed construction of a

dairy farm wastes treatment system. A description is given of the project site, the experimental treatment system, and the studies that are to be made. The treatment system consists of a concrete flow metering box; an aerated grit chamber; a dual section aeration tank with a hopper bottom; a chlorine contact tank, a pump and piping system that enable treated and chlorinated wastewater to be used for washing down the treatment facility and flushing the holding area; a small building, which houses two blowers for supplying air to the aeration tank, the chlorinator for the facility, the treatment system electrical control panel; an air flow meter for measuring the air flow to the aeration tanks; a wastewater flow recorder; other mechanical equipment; and the project site laboratory. The system was designed essentially to utilize the extended aeration modification of the activated sludge waste treatment process and to operate on a 'fill-and-draw' basis. The treatment methods to be studied were based on biological processes or combination of biological processes. (See also W74-09663) (Marquard-East Central)
W74-09692

EVALUATION OF BEEF WASTE MANAGEMENT ALTERNATIVES,
Oklahoma State Univ., Stillwater.
A. R. Butchbaker, J. E. Garton, G. W. A. Mahoney, and M. D. Paine.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 365-384, (1972). 7 fig, 6 tab, 21 ref.

Descriptors: *Cattle, *Farm wastes, *Waste water treatment, *Waste disposal, *Waste storage, Climates, Slurries, Costs, Agricultural runoff, Solid wastes, Farm lagoons, Legal aspects.
Identifiers: *Waste management alternatives, *Confinement buildings, Open feedlots, Site selection.

Waste management design alternatives are outlined for both open and housed feedlot feeding facilities. Among the major conclusions are: (1) No treatment system for liquid feedlot wastes produces an effluent suitable for discharge to a stream. (2) Areas where moisture deficit is greater than 10 inches have high potential for using evaporation for ultimate disposal of liquid wastes. (3) Paving open feedlots reduces pen surface area and runoff control structure sizes to about one-third of the area and sizes required for unpaved feedlots. (4) Confinement buildings offer a high potential for pollution control. Capital costs are higher than for open feedlots, but land areas are reduced, rainfall runoff structures are unnecessary and wastes may be removed either as a semi-solid or as a slurry. (5) A slurry hauling system utilizing soil injection for handling liquid wastes from storage pits provides an optimum system for abatement of odors and water pollution, but is more expensive and slower than surface spreading. (6) A manure irrigation system for pumping a slurry or wastewater for field application costs about one-half as much as mechanically hauling and spreading a slurry within one-half mile of the feeding facilities. (7) Ultimate disposal of feedlot waste on agricultural land should be encouraged. (See also W74-09663) (Marquard-East Central)
W74-09693

CHARACTERISTICS OF WASTES FROM SOUTHWEST BEEF CATTLE FEEDLOTS,
Texas Tech Univ., Lubbock.
D. M. Wells, G. F. Meenaghan, R. C. Albin, E. A. Coleman, and W. Grub.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 385-404, (1972). 5 fig, 17 tab.

Descriptors: *Feed lots, *Farm wastes, *Southwest U.S., *Waste water treatment, *Waste disposal, Feeds, Slopes, Semiarid climates, Texas.
Identifiers: *Concrete-surfaced feedlots, *Dirt-surfaced feedlots, Waste characteristics, Composting.

Studies conducted on concrete-surfaced feedlots and on dirt-surfaced feedlots with varying degrees of slope yielded the following conclusions: (1) Pollutant concentrations of runoff are in a range of one to more than two orders of magnitude higher than concentrations found in untreated municipal sewage. (2) Treatment of runoff from Southwestern cattle feedlots is infeasible. (3) Concentrations of pollutants in runoff resulting from precipitation on concrete-surfaced lots are two to four times greater than corresponding concentrations from dirt-surfaced lots. (4) The quantity of solid waste accumulating on the feedlot floor is a direct function of the fraction of roughage in the finishing ration. (5) The fraction of incident precipitation running off concrete lots is twice the fraction running off dirt-surfaced lots. (6) Stocking rates above 40 square feet per animal on concrete lots do not enhance animal performance. (7) Limited feeding trials utilizing a roof to eliminate runoff had no effect on cattle performance. (8) Increasing slope of concrete feedlots from 7 1/2 to 15 percent makes lots virtually self-cleaning. (9) Aerobic composting of solid wastes is technologically feasible regardless of the type of operation. (10) Extreme caution must be exercised in application of feedlot runoff to agricultural crops. INITIAL OBSERVATIONS OF SEVERAL MEDIUM SIZED BARRIERED LANDSCAPE WATER RENOVATION SYSTEMS FOR ANIMAL WASTES,
Michigan State Univ., East Lansing.
A. E. Erickson, J. M. Tiedje, B. G. Ellis, and C. M. Hansen.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 405-410, (1972). 1 fig, 2 tab, 2 ref.

Descriptors: *Waste water treatment, *Waste disposal, *Farm wastes, *Water pollution, *Soil contamination, *Nitrogen, *Phosphorus, Denitrification, Carbon, Livestock, Hogs, Nitrates, Effluent, Aquifer.
Identifiers: Barriered Landscape Water Renovation System(BLWRS).

Adsorption and filtering action of soils can be used to renovate waste water, but the expense of land and its management as well as land availability in many places has forced the intensive spreading of wastes on limited acreages with the possible pollution of water resources. Because there is a need for a method of renovation which is more efficient, doesn't require such large land areas, and is not as expensive as conventional sewage treatment and disposal, BLWRS (Barriered Landscape Water Renovation System) has been developed. It consists of a limestone or slag covered mound of soil underlain by an impervious water barrier. BLWRS's method is relatively inexpensive to construct, requires a minimum of maintenance, requires a smaller area than is needed for irrigation spreading systems, and removes large amounts of the nitrogen, carbon and most of the phosphate from the local environment. Tests are too incomplete for BLWRS's to be used commercially, but so far its nitrogen and phosphate removal capability has been as high as 99% for animal wastes. W74-09695

REMOVAL OF PHOSPHORUS FROM LIQUID ANIMAL MANURE WASTES,
Cornell Univ., Ithaca, N.Y.
R. C. Loehr.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 411-427, (1972). 4 fig, 2 tab, 4 ref.

Descriptors: *Farm wastes, *Liquid wastes, *Phosphorus, *Waste water treatment, *Waste disposal, Alum, Hydrogen ion concentration, Poultry, Ducks(Domestic), Cattle, *New York.
Identifiers: Chemical removal, Alum, Ferric chloride.

Results are presented of detailed laboratory studies to remove phosphorus from duck, poultry, and dairy manure wastewaters and the feasibility of such removal is discussed. The studies investigated the effect of phosphorus concentrations, pH control, different coagulants and wastewater source. The three chemicals used in the phosphorus removal experiments were: alum - AL2(SO4)3; lime - CaO; and ferric chloride - FeCL36H2O. Actual comparison of the three chemicals was difficult since they were used in wastewaters of different characteristics and chemical demand. Chemical choice was determined by required dosage, chemical cost, and the costs of ultimate solids disposal. The alum requirements were less than those of lime for most poultry manure wastewaters; lime requirements were less for duck wastewater. Controlled land disposal should be considered a high priority method for phosphorus control from animal wastewaters because it is more amenable to normal animal production operations, avoids the need for chemical control and treatment plant operation, and eliminates additional problems of chemical costs and sludge production handling and disposal. HEAVY MANURE APPLICATIONS: BENEFIT OR WASTE,
Massachusetts Univ., Amherst. Dept. of Plant and Soil Sciences.
M. E. Weeks, M. E. Hill, S. Karczmarczyk, and A. Blackmer.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 441-447, (1972). 6 tab, 4 ref.

Descriptors: *Farm wastes, *Waste disposal, *Rates of application, Nitrogen, Phosphorus, Salts, Connecticut, Massachusetts, *Corn(Field), *Waste treatment, Nitrates.
Identifiers: Agawam sandy loam, Hadley sandy loam, Chlorides.

A study was started to determine the effects of high rates of manure on the growth and yield of corn crops and on chemical and physical change in light textured soils. Three experimental sites with sandy loam soils were used. After two years of experimenting, the following was revealed: (1) Large manure applications on well-drained sandy loam soils should not adversely affect crop growth or yield. (2) Manure applications have a favorable effect on general tilth and workability of soil. (3) Nitrates, chlorides and other salts move through the soil profile at all levels of application, though during the growing season a crop of corn would utilize much of the nutrients as they become available, probably as high as 42 tons per acre. (4) Leaching would occur mainly before the crop is established and after it is removed. (5) Annual applications of manure for purposes of disposal on crop land should be made only after due consideration is given to location and total amount of area covered. The crops themselves were not analyzed for nitrate content. (See also W74-09663) (Marquard-East Central)

EFFECTS OF SOLID BEEF FEEDLOT WASTES ON SOIL CONDITIONS AND PLANT GROWTH,
Kansas State Univ., Manhattan.
L. S. Murphy, G. W. Wallingford, W. L. Powers, and H. L. Manges.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 449-464, (1972). 15 fig, 2 tab, 12 ref.

Descriptors: *Feed lots, *Farm wastes, *Waste disposal, *Nitrogen, *Nitrates, *Phosphorus, Rates of application, Nutrient removal, Plant growth, Soil chemical properties, Ions, Sodium, Potassium, Cattle, *Kansas, Waste treatment.
Identifiers: Electrical conductivity, Saturation extract conductivity, Greensburg silty clay loam, Silage yields.

Results of a two-year study indicate that large applications of solid beef feedlot manure can depress yields of corn silage. Silage yields were found to have a quadratic relationship to manure applications. Maximum yields were realized between 225 and 300 MT/ha. Depressed yields were due to accumulation of salts from manures. Electrical conductivity of the soil saturation extract increased linearly with manure applications. Sodium, potassium, phosphorus, NO3 -N and nitrogen were found in large quantities in the soil; however, NO3 N and nitrogen was not in large quantities of the corn silage, while phosphorus was. Results suggest that the detrimental effects of excessive manure application may be reversed by continued cropping and adequate water penetration of the soil. GRASS RESPONSE TO APPLICATIONS OF BEEF-CATTLE FEEDLOT RUNOFF,
M. B. Satterwhite, and C. B. Gilbertson.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 465-480, (1972). 7 fig, 7 tab, 27 ref.

Descriptors: *Feed lots, *Agricultural runoff, Chemical analysis, *Rates of application, Grasses, Soil chemical properties, Nutrients, Soil profiles, Cattle, *Nebraska, *Waste water treatment.
Identifiers: Orchard grass, Little bluestem, Switchgrass, Reed canarygrass, Big bluestem, Intermediate wheatgrass, Brome grass, Side-oats grama, Indiangrass.

Field and greenhouse investigations were initiated to determine the response to various kinds of grasses to applications of beef feedlot runoff. Chemical aspects of the runoff, grasses tested, grass production, protein content, and soil analyses are tabulated. It was found that yearly variation in runoff could lead to differences in grass response. Response could range from increased yields to death. Under controlled greenhouse conditions, grasses in order of decreasing response were: Orchard grass, Little bluestem, Switchgrass, Reed canarygrass, Big bluestem, Intermediate Wheatgrass, Brome grass, Side-Oats grama, and Indiangrass. A STUDY OF CORN RESPONSE AND SOIL NITROGEN TRANSFORMATIONS UPON APPLICATION OF DIFFERENT RATES AND SOURCES OF CHICKEN MANURE,
Cornell Univ., Ithaca, N.Y.
K. MacMillan, T. W. Scott, and T. W. Bateman.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 481-494, (1972). 7 fig, 10 tab, 5 ref.

Descriptors: *Farm wastes, *Rates of application, *Nitrogen, Potassium poultry, Electrical conductance, Acidic soils, Salts, Hydrogen ion concentration, *New York, *Waste water treatment, *Corn(Field).
Identifiers: Chicken manure, Soil nitrogen transformation, Oxidation ditch manure, Diffused air manure.

A 37-day greenhouse experiment was initiated to (1) determine corn response when extremely different rates of treated manure sources were applied to two typical New York soils differing in pH and (2) determine soil nitrogen transformations under the above conditions. Raw manure was applied at rates 0, 75, 155, 310, and 620 micro gN/gm soil. All other sources (stored oxidation ditch manure, oxidation ditch manure, and diffused air manure) were applied at rates 0, 125, 250, 500, and 1000 micro gN/gm soil. It was concluded that: (1) high rates of manure applications did not result in excessive amounts of salts nor destroy the microbial population, (2) Luxury Nitrogen and potassium consumption resulted from the application of high rates of the manure sources studied, (3) In low pH soils the corn grew well; in high pH soils the effect of manure application was detrimental. This suggested that acid soils have the greatest potential for manure disposal and maximum crop efficiency. (See also W74-09663) (Marquard-East Central)

A STUDY OF FOAMING PROBLEMS IN AN OXIDATION DITCH TREATING SWINE WASTE,
Toronto Univ. (Ontario).
P. H. Jones, and N. K. Patni.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 503-515, (1972). 14 fig, 2 tab, 3 ref.

Descriptors: *Farm wastes, *Swine, *Oxidation lagoons, *Foaming, *Waste water treatment, Temperature, Hydrogen ion concentration, Suspended solids.
Identifiers: *Oxidation ditch, *Electronic foam sensor, Beloit-Passavant Rotor, Foam suppressants, Electrodes, Silicon controlled rectifier.

A study was made of the occurrence of foam and the factors affecting foam generation in a full-scale oxidation ditch used for treatment of daily wastes of approximately 400 swine. Foam formation was monitored daily for 211 days and temperature, dissolved oxygen, pH, suspended solids, etc. were measured. A rotor operated within the ditch to promote aeration. Breaking the foam with water spray proved unsatisfactory. By the 6th week, foaming was acute. The use of winter fuel oil and commercial foam depressants proved unsatisfactory. A five foot high wooden head-box was constructed downstream of the rotor to catch the foam, but proved to be not strong enough. After the winter freeze the ditch was restarted May-August, 1971. An electronic foam sensor was devised. When foam built up too much, the sensor caused the rotor to shutdown. A red warning light alerted farm personnel. 1-3 hours was allowed to let the foam subside. Then the rotor was manually restarted. The foam sensor operating in conjunction with the head-box completely eliminated foam spillovers. Little maintenance was required and the necessity of closely watching the foam was removed. (See also W74-09663) (Merryman-East Central)

TREATMENT AND DISPOSAL OF SWINE WASTE,
T. J. Mulligan, and J. C. Hesler.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 517-536, (1972). 8 fig, 4 tab.

Descriptors: *Waste water treatment, *Waste disposal, *Farm wastes, *Hogs, Confinement pens, Feeds, Biochemical oxygen demand, Chemical oxygen demand, Foaming, Aerated lagoons, Anaerobic conditions, Odor.
Identifiers: Swine, Refeeding.

Several treatment systems for swine wastes are reviewed. Specific studies are cited and formulas derived. Anaerobic lagoons and aerated lagoons reduce the organic contents of wastewater. Discharge of the treated settled effluent to surface waters after this type of treatment, however, is often unsatisfactory due to the nutrient content and color of the wastewater. Also, the remaining BOD, suspended solids, coliform, and salt content may be objectionable in certain receiving waters. Liquid wastewaters may be disposed of by spray irrigation or evaporation ponds. Each of these methods requires significant land area and may be accompanied by an odor problem. Wastes may be spread on the land or plowed and furrowed, but again there is a potential odor problem and large land area is required. Also, in cold climates the wastes would have to be stored until they could be deposited on the land. Wastes may be refed, but more research is needed. Many variables must be evaluated in determining ultimate treatment and disposal of animal waste. Imaginative approaches to the overall waste problem are needed. (See also W74-09663) (Merryman-East Central)
W74-09704

AEROBIC TREATMENT OF SWINE WASTE BY AERATOR-AGITATORS ('FUCHS'),
Kiel Univ. (West Germany).
U. Riemann.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 537-544, (1972). 2 fig, 1 tab.

Descriptors: *Farm wastes, *Hogs, *Aerobic treatment, *Waste water treatment, *Waste disposal, Odor, Salmonella, Liquid wastes, Foaming.
Identifiers: Swine, *Aerator-agitators, Liquid manure reactors.

An experimental plant was constructed consisting of 3 liquid manure reactors (each having a recirculating aerator), a pump sump pit, and an earth reservoir for evaporation and distribution of foam in order to investigate deodorization, biological disinfection, treatment, and disposal of pig manure through use of an aerobic treatment system. The pump sump pit received the liquid manure from the third reactor and the partially clarified liquid was distributed or directed to a storage tank. A nearly complete deodorization of fresh manure could be achieved after a daily refill of 3 m3 fresh manure. Bacteriological investigations using salmonellae indicated that the bacteria were dead six hours after entering reactor I at temperatures around 50C. Sedimentation tests indicated that organic and inorganic flucculants have a positive effect on the separation process. Fertilization trials revealed (1) Aerated liquid manure is less corrosive than untreated manure to plants. (2) A total of 50 m3/ha aerated liquid manure yields a 10% higher crop of summer barley than does the untreated. (3) Treated or untreated applications to rape-seed had a negative effect. (4) Fertilization of 150 m3/ha of aerated liquid manure on sugar beets gave a slightly better result than the untreated fertilization. (5) Corn digests high liquid manure quantities. Further investigations are in progress. (See also W74-09663) (Merryman-East Central)
W74-09705

NITROGEN LOSSES THROUGH DENITRIFICATION AND OTHER CHANGES IN CONTINUOUSLY AERATED POULTRY MANURE,
Guelph Univ. (Ontario).
G. G. Dunn, and J. B. Robinson.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 545-554, (1972). 10 fig, 1 tab, 7 ref.

Descriptors: *Nitrogen, *Farm wastes, *Poultry, *Waste storage, *Waste water treatment, Liquid wastes, *Oxidation lagoons, Denitrification, Temperature, Biochemical oxygen demand, Chemical oxygen demand, Organic loading, *Canada.
Identifiers: Loading rate, Total solids, Volatile solids.

The objectives were to: (a) determine the effectiveness of pilot scale oxidation ditches in stabilizing the organic loading placed on them, and (b) determine the conditions of oxidation-reduction potential in the liquid waste under which nitrogen was eliminated. Two trials were conducted. The first lasted 138 days during winter (average ditch temperature 11 deg C) conditions. The second lasted 160 days under summer (average ditch temperature 18 deg C) conditions. Two ditches were used which had dividing partitions separating the rotor in the ditches from the birds. The rotor speed on Ditch II was fixed at 95 rpm. The rotor speed in Ditch I (which was variable) was set for the same ditch velocity. Forty-two cages housing 90-100 white leghorns were suspended over each ditch and the droppings fell directly into the ditch. The winter loading rate was 120 mg/liter/day of biochemical-oxygen demand and 375 mg/liter/day of chemical oxygen demand. The summer rate was 150 mg/liter/day of BOD and 500 mg/liter/day of COD. Experimental results indicated that the oxidation ditches were adequate for storing and treating liquid chicken manure in an odor-free condition for periods up to 160 days under the experimental loading conditions. At this loading rate losses of 70-80% of the added nitrogen could be expected with little effect of temperature in the range 11 deg C-18 deg C. (See also W74-09663) (Merryman-East Central)
W74-09706

SOLIDS BALANCE ON A BEEF CATTLE OXIDATION DITCH,
R. O. Hegg, and R. E. Larson.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 555-562, (1972). 3 fig, 4 tab, 7 ref.

Descriptors: *Farm wastes, *Cattle, *Oxidation lagoons, Chemical oxygen demand, Biochemical oxygen demand, Hydrogen ion concentration, Liquid wastes, *Minnesota, *Waste water treatment, *Solid wastes.
Identifiers: Solids balance, Beef, Total solids, Total volatile solids.

The objective was to determine the solids balance on a summer operations of an oxidation ditch for 36 beef animals which were fed a high concentrate ration. This oxidation ditch also included the removal of some of the settled solids during the experiment. The solids balance was made by comparing the total solids, total volatile solids, and fixed solids of the waste matter going into the ditch with material taken out of the ditch. Input consisted of the fecal matter (4.6 pounds dry matter per day) and the urine (15.6 pounds per day) for each animal. The output consisted of the settled solids (partially digested corn) most of which were periodically removed during the experimental period for recycling. Total solids were reduced 39% and total volatile solids were relatively unchanged. (See also W74-09663) (Merryman-East Central)
W74-09707

LAGOONS FOR MILKING CENTER WASTES,
R. Crowe, and R. L. Phillips.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 563-567, (1972).

Descriptors: *Lagoons, *Dairy industry, *Farm wastes, *Waste storage, *Design criteria, *Waste water treatment, Cattle, Biochemical oxygen demand, *New York.

Rural Environmental Assistance Program cost-sharing by the federal government has spurred many requests for assistance from the Soil Conservation Service in construction of lagoons for milking center wastes. A farmer who requests assistance is usually visited by the Cooperative Extension agent, SCS, and a representative of the health department. Location and practicality of the lagoon are influenced by (a) nearest residence, (b) prevailing wind direction, (c) general soils in the area, (d) type of outlet-gravity or pumping, (e) discharge point, (f) stream location, characteristics, and classification, (g) herd size - present and future, (h) present waste disposal system and (i) estimated cost of the lagoon. Lagoon layouts are designed with a surfac0 area of 125 square feet per cow, are usually partially below and partially above the ground, and have a length to width ratio of 3:1. Rectangular shape is most economical. Maximum depth should be 5 feet and minimum 2 feet. The botton should be level. Once the details are worked out, a cost estimate is made and the drawings and estimate are reviewed with the landowner for his concurrence and approval. The drawings and specifications, with a summary design report and application, are then submitted to the county health department for approval. (See also W74-09663) (Merryman-East Central)

PILOT PLANT COMPARISON OF LIQUID AND DRY WASTE MANAGEMENT SYSTEMS FOR POULTRY MANURE,
Cornell Univ., Ithaca, N.Y.
D. C. Ludington, A. T. Sobel, R. C. Loehr, and A. G. Hashimoto.
In: Waste Management Research, Proceedings of the 1972 Cornell Agricultural Waste Management Conference, Ithaca, New York, p 569-580, (1972). 2 fig, 4 tab, 6 ref.

Descriptors: *Farm wastes, *Liquid wastes, *Poultry, *Odor, *Oxidation lagoons, *Waste water treatment, Air pollution, Aeration, Solid wastes, Pilot plants.
Identifiers: *Waste management systems, Undercage drying-forced air, Undercage drying-fins, Diffused aeration.

Two primary waste management techniques are known to control the production of odors. The first is removal of moisture from manure soon after defecation. The second is to properly aerate a liquefied manure and maintain the waste in an aerobic condition. Four different systems based on these two techniques were studied: (a) oxidation ditch, (b) undercage drying-forced air, (c) undercage drying-fins, and (d) diffused aeration. These experiments proved that properly aerating a liquefied manure and removing sufficient moisture from fresh manure will control odors in a poultry house. If a high degree of odor control is necessary, then the properly aerated liquid manure system would be the one to select. If the conditions are less severe, undercage drying may accomplish sufficient odor control at a reduced operating cost. The losses of nitrogen for the various systems may or may not be an advantage depending upon the local situation and the point of ultimate disposal. The removal of volatile solids does permit operation at a lower total solids concentration with less dilution water. Specific trials and results are outlined and tabulated. CHEMICAL ADDITION TO TRICKLING FILTER PLANTS,
Beard (Arthur) Engineering, Inc., Chevy Chase, Md.
G. L. Nickerson, C. M. Robson, R. D. Morrison, and R. C. Clinger.
Journal Water Pollution Control Federation, Vol 46, No 1, p 133-147, January 1974. 9 fig, 7 tab, 3 ref.

Descriptors: *Filtration, *Virginia, Water treatment, *Biochemical oxygen demand, *Suspended solids, Hydraulic engineering, Chemical engineering, *Waste water treatment, *Trickling filters.
Identifiers: *Fairfax County(Va).

A chemical addition system for increasing the overall BOD and SS removals at two Fairfax County, Virginia, trickling filter wastewater treatment plants is described. Ferric chloride was added at the influent end of the grit chamber and cationic polymer was added in the Parshall flume, just before the flow enters the primary clarifiers. These additions achieved approximately 85 percent SS and 60 percent BOD removals. Hydraulic capacity was increased by raising the wall levels of critical manholes and structures where overflows had previously occurred, but this correction frequently caused an overflow at another. A total chemical cost to treat the liquid flow averaged approximately $85 per million gallons at one plant and $71 per million gallons at the other plant. Increased sludge handling problems may be expected when chemical addition to the liquid stream is practiced for increased removal of oxygen demanding materials. Existing sludge handling facilities should be carefully reviewed for adequacy. Any necessary improvement should be made before liquid stream chemical addition. Further, addition of chemicals to the sludge handling system may be required to enhance thickening and dewatering operations. (Merritt-FIRL)

SMALL TOWN SPENDS A BIG $8 MILLION,
Whitman and Howard, Inc., Boston, Mass.
R. E. Hickeman.
Water and Wastes Engineering, Vol 10, No 12, p 42-44, December, 1973.

Descriptors: *Water treatment, *Rhode Island, *Activated sludge, *Aeration, Septic tanks, Waste treatment, *Waste water treatment, *Tertiary treatment.
Identifiers: West Warwick(R.I.), Pawtuxet River(R.I.).

The design and operation of the secondary waste treatment plant in West Warwick, Rhode Island are described. Renovation and enlargements were made on existing plants to provide a 5.0 mgd facility to help clean up the Pawtuxet River. The $2.5 million treatment plant can provide conventional complete mix activated sludge and step aeration methods of secondary treatment depending on the quality, quantity, and characteristics of the raw wastewater. Septic from individual homeowner cesspools and septic tanks is delivered by tank trucks in a daily volume ranging from 6,000 to 25,000 gallons. The septage is passed to a receiving tank, chlorinated for odor control, degritted, and stored. Four square aeration tanks each with one 7.5 hp fiberglass mechanical surface aerator registers BOD levels ranging from 1000 milligrams/liter to 350 milligrams/liter. The system readily adjusts to varying demands while maintaining a mixed liquor concentration between 2,900 and 4,700 milligrams/liter and dissolved oxygen levels between 2.0 and 3.0 milligrams/liter. The digester was converted into a post-chlorine contact tank which pumps the excess activated sludge into two sludge flotation thickeners. The thickened sludge is then dewatered. (Merritt-FIRL)
W74-09711

ALTERNATIVE STRATEGIES FOR MANAGING WASTEWATER,
Indiana Univ., Bloomington. School of Public and Environmental Affairs.
R. S. Howe.
Journal of Soil and Water Conservation, Vol 28, No 6, p 252-255, November/December, 1973. 2 tab, 10 ref.

Descriptors: *Water management(Applied), Water treatment, *Activated sludge, *Land management, Land use, *Waste water treatment, Waste disposal.
Identifiers: *Physical-chemical treatment, *Land disposal.

Strategies for managing wastewater are discussed; they include the activated sludge process, physical-chemical treatment, and land disposal. The activated sludge process consists of pretreatment, primary clarification, and single stage biological treatment. The process requires some means for disposing of sludge, as through dewatering at the plant and then transporting the dried solids to a land disposal site, or it may entail transport of liquid sludge by barge, truck, or pipe to a land disposal site. The physical-chemical process requires a means for disposal of the substantial quantities of solids that are generated. Chemicals frequently used are lime, alum, and iron salts. Land disposal systems can be categorized as infiltration systems (recharge basins, septic tanks, absorption fields, spray disposal, and ridge and furrow basins) or irrigation systems (spray irrigation, flood irrigations, and the living filter). Advantages of the activated sludge system include small land area, lower initial capital investment, removal of certain toxic materials, ability to handle overload situations, and greater immunity to the vagaries of weather. Disadvantages include higher operating costs, more difficult operation, and use of chemicals that may introduce trace quantities of impurities that result in water quality standard violations. (Merritt-FIRL)
W74-09712

A MEMBRANE BIOLOGICAL FILTER DEVICE FOR REDUCING WATERBORNE BIODEGRADABLE POLLUTANTS,
Boyce Thompson Inst. for Plant Research, Inc., Yonkers, N. Y.
G. W. McClure.
Water Research, Vol 7, No 11, p 1683-1690, 1973. 2 fig, 2 tab, 12 ref.

Descriptors: Filtration, Membranes, *Biological membranes, *Membrane processes, *Filters, *Herbicides, *Biodegradation, *Waste water treatment.
Identifiers: Isopropylphenylcarbamate.

A membrane biological filter device for reducing waterborne biodegradable pollutants was modeled by a laboratory system. A phenylcarbamate-degrading population of microorganisms reduces the concentration of the herbicide isopropylphenylcarbamate (IPC) in a continuously flowing stream. The microorganisms are kept separate from the feed stream by an ultrafilter membrane which retains the microorganisms, but allows passage of all smaller materials. As the feed stream passes through the device, IPC is transferred to the bath of microorganisms and metabolized. The percentage reduction of IPC in the feed stream depends primarily on the efficiency of transfer across the membrane, the velocity of the feed stream, the quantity of microbes retained in the bath, and the factors affecting their activity. An equation is derived relating these variables under the assumption of complete transfer of IPC to the bath and a constant rate of IPC degradation per unit of microbes. Problems and improvements are discussed. (Merritt-FIRL)
W74-09713

OZONE: AN ALTERNATIVE TO CHLORINE,
J. T. Sliter.
Journal Water Pollution Control Federation, Vol 46, No 1, p 4-6, January, 1974.

Descriptors: Municipal water, *Ozone, *Coliforms, Sewage bacteria, *Disinfection, Viruses, Biochemical oxygen demand, Chemical oxygen demand, Phenols, *Waste water treatment, Costs.
Identifiers: Cyanides.

The advantages of ozone as an alternative to chlorine disinfection of wastewaters are discussed. Beginning in 1977, all municipal treatment plants must disinfect their effluent to achieve a fecal coliform level of 200/100 milliliters. Pilot investigations show that ozone is a quicker and more efficient disinfectant than chlorine by a factor of 3,000. A five milligram/liter dose of ozone applied for less than two minutes yielded a significant reduction in total plate count and fecal coliform levels in wastewater effluent. Ozone can reduce the number of viruses, but the techniques are tentative, and actual reductions uncertain. Ozone does not leave a residual of compounds toxic to aquatic life. Ozone can reduce the concentration of suspended solids to less than two milligrams/liter. Tertiary treatment plants have used ozone to reduce the biochemical oxygen demand, the chemical oxygen demand, cyanides, and phenols. About two parts ozone destroy one part phenol. Production cost is the largest single item in ozone treatment. It would cost a one mgd plant using ozone for tertiary treatment $0.26/1000 gal; but a 50 mgd plant, only $0.10/1000 gal. (Merritt-FIRL)
W74-09714

CARBON TREATMENT OF A MUNICIPAL WASTEWATER,
Envirotech Corp., Salt Lake City, Utah. Eimco Process Machinery Div.
D. E. Burns, and G. L. Shell.
Journal Water Pollution Control Federation, Vol 46, No 1, p 148-164, January, 1974. 8 fig, 13 tab, 21 ref.

Descriptors: *Utah, *Pilot plants, Carbon, *Waste water treatment, Municipal wastes, *Sewage treatment.
Identifiers: *Salt Lake City(Utah), Powdered carbon, *Carbon treatment.

The use of powdered carbon for the removal of soluble organics from municipal raw wastewater was evaluated in a Salt Lake City, Utah, pilot plant study. The carbon treatment system included two carbon contactors, a granular media filter, a gravity thickener, and a vacuum filter. Solid contact units were very effective for contacting and removing powdered carbon for chemically treated and gravity clarified municipal wastewater. The two-stage, counter-current contacting was more efficient, (requiring less carbon) than single-stage contacting. The total solids recycle and variable area clarification zone features of the units used were key factors in providing a significant level of biological activity without odor problems and in accomplishing effective removal of carbon solids. Effective gravity clarification of carbon suspensions was achieved at overflow rates of up to 0.8 gpm/sq ft without the use of flocculation aids. Granular media filtration effectively removed carbon particles from carbon contactor effluent. Alum treatment followed by a two-stage countercurrent carbon contacting with 75 milligram/liter dosage would cost $0.83/1000 gal, including chlorination. The predicted plant effluent quality would be considerably better than a secondary biological treatment effluent for all parameters, but particularly for phosphorus and suspended solids. (Merritt-FIRL)

DATA ACQUISITION AND COMBINED SEWER CONTROLS IN CLEVELAND,
Cleveland Dept. of Public Utilities, Ohio.
K. A. Pew, R. L. Callery, A. Brandstetter, and J. J. Anderson.
Journal Water Pollution Control Federation, Vol 45, No 11, p 2276-2289, November, 1973. 10 fig, 9 ref.

Descriptors: *Combined sewers, *Rainfall-runoff relationships, Storm runoff, *Waste water treatment, Model studies, *Ohio, Water storage.
Identifiers: *Cleveland(Ohio).

The development of a system for the comprehensive control of combined sewer overflow pollution in the Southerly Sewerage District of Cleveland, Ohio, is described. The project will acquisition and analyze real time rainfall and sewer system load information, and will operate by closed loop automatic control. The control system will operate an optimum combination of control, storage, treatment, and conveyance facilities. Automatic wastewater samplers have been purchased, and automated chemical analyzers are being acquired to analyze chemical oxygen demand, total Kjeldahl nitrogen, sulfate, phosphate, nitrate, ammonia, and chloride. Mathematical models were developed and used as analytical tools for the design and control of the sewer system improvements, and remotely operated regulators were designed. The construction cost has not yet been estimated, but should be in the order of $60 million or approximately $300/acre ($7400 ha), less than the cost of sewer separation. (Merritt-FIRL)
W74-09716

WASTEWATER SYSTEM ALTERNATES: WHAT ARE THEY...AND WHAT COST,
Anderson-Nichols and Co., Boston, Mass. Environmental Sciences Div.
R. P. Monti, and P. T. Silbermann.
Water and Wastes Engineering, Vol 11, No 4, p 36-40, April, 1974. 5 fig, 1 tab.

Descriptors: *Waste water treatment, *Alternate planning, Ammonia, Suspended solids, BOD, Waste disposal, *Filtration, Filters, Nitrification, Nitrates, *Waste disposal, *Denitrification, Effluents, Infiltration, Irrigation, Runoff.
Identifiers: *Polishing ponds, Microstraining device, *Treatment alternatives, Sand filtration.

Alternatives to conventional secondary waste treatment that will meet the best possible practical treatment requirements of 1983 are discussed. Because the Federal requirements are not entirely clear on BOD, ammonia, and suspended solids, an additional treatment step is proposed. If land is available, the least costly treatment may be a polishing pond. If no land is available, rapid sand filtration columns could be used. A microstraining device could remove additional suspended solids and their associated BOD from treatment plant effluents. The most economical method of ammonia removal is single stage nitrification. This biological process converts ammonia to nitrates in an aeration tank. The most troublesome of the pollutants is nitrate which has a maximum allowable groundwater limit of 10 mg/liter. If ground disposal is chosen, the most reasonable type of denitrification process would be a packed column reactor added after conventional treatment and using methanol addition as a source of carbon for the denitrifying organisms. In the case of land disposal, there are three basic techniques for surface application of waste water effluent to the land: spray irrigation, overland runoff, and rapid infiltration. (Merritt-FIRL)
W74-09718

STOCHASTIC ANALYSIS OF ORTHOKINETIC FLOCCULATION,
Air Force Inst. of Tech., Wright-Patterson AFB, Ohio.
P. W. Cockerham, and D. M. Himmelblau.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 100, No EE2, p 279-293, April, 1974. 8 fig, 1 tab, 7 ref.

Descriptors: *Stochastic processes, *Flocculation, *Water treatment, Model studies, Dispersion, *Waste water treatment, Statistical methods.

The application of a stochastic analysis to orthokinetic flocculation, a common operation in water treatment, is illustrated. Both the unsteady-state and the steady-sample response could be represented by a normal distribution regardless of the types of distributions used for the flocculation model inputs and parameters. The sample mean response agreed with the deterministic solution if normal distributions are used for the flocculation model inputs and parameters, but not otherwise. Dispersion in the model parameter had a greater effect on the dispersion of the sample output than did the model parameters. Dispersion in G (the root mean squared velocity gradient) had the least effect on the dispersion of the sample output. The degree of dispersion in the process flow rate had little effect on the flocculator overdesign factor. The stochastic approach is applicable to the stochastic analysis of other important processes in water and waste water treatment. Of particular value is the method of calculating overdesign factors. The stochastic approach does not reduce the uncertainty involved in the processes, but it does not allow one to make more objective decisions about the uncertainty. This is becoming more and more important as effluent quality standards become more stringent. (Merritt-FIRL)
W74-09719

APPARATUS FOR TREATING WASTE FLUIDS BY MEANS OF DISSOLVED GASES,
Pollution Control Engineering, Inc., Downey, Calif. (assignee).
G. E. Hurst.
U.S. Patent 3,773,179. Official Gazette of the United States Patent Office, Vol 916, No 3, p 932, November 20, 1973.

Descriptors: *Suspended load, Suspended solids, *Waste disposal, *Patents, Equipment, *Waste water treatment.
Identifiers: Apparatus.

An apparatus for treating wastewater to remove suspended pollutants is described. It consists of a tank with a plurality of compartments through which the fluid is repeatedly pumped from one compartment to the next. At each pumping station, gas is injected at the suction side of the pump and back pressure is maintained in the discharge line to force more gas into solution. Effluent from each compartment is taken near the bottom and the discharge is located midway of the height, confined to a small area, and then deflected by a deflector plate. Clarified water is removed by a riser tube from the bottom of the final compartment and flows over a weir. The floated matter is removed from the fluid surfaces in each compartment by skimming or other methods. (Merritt-FIRL)
W74-09721

METHOD FOR TREATING WATER CONTAINING SUSPENDED SOLIDS FROM A SANITARY SYSTEM,
Ecodnye Corp., Chicago, Ill. (assignee).
J. W. McKibben, B. L. Goodman, and R. B. Higgins.
U.S. Patent 3,770,624. Official Gazette of the United States Patent Office, Vol 916, No 1, November 6, 1973.

Descriptors: Suspended solids, Treatment, *Separated sewers, *Recycling, *Aeration, *Patents.
Identifiers: Apparatus.

An improved method and apparatus for treating water containing suspended solids from a sanitary system are described. The water is aerated and delivered to a screen with a directional component across the screen surface and a directional component through the screen. The screen has openings large enough to pass the majority of the solids suspended in the water, and has the ability to hold a coating of these solids on its upstream side. The flow of water is controlled so that a coating of the suspended solids from the water is formed on the screen surface. The delivery of water containing these suspended solids to the screen is continued with a directional component across the screen and a directional component through the screen, in order to filter solids from the water passing through the coating and screen. The relationship between the directional components across and through the screen is controlled to maintain the coating on the screen. The water that is passed through the screen is stored, and is recycled to the sanitary system. (Merritt-FIRL)
W74-09724

APPARATUS FOR RELEASING CHEMICALS CLEARING AND CLEANING WASTE PIPES,
R. M. Stalnaker.
U. S. Patent 3,771,968. Official Gazette of the United States Patent Office, Vol 916, No 2, p 617-618, November 13, 1973.

Descriptors: *Pipes, Engineering structures, *Sewers, *Cleaning, Treatment, *Patents.
Identifiers: Apparatus.

An apparatus for releasing chemicals that clears and cleans waste pipes is described. An elongated tubular-shaped dispenser with a plurality of axially and circumferentially spaced openings is attached to a rotational support plug. The dispenser releases chemicals in predetermined amounts in response to flushing water. It is capable of destroying, clearing, and cleaning obstructions located in the waste pipe. A chemical capable of aiding in the control of pollution could also be utilized in the dispenser. The disposable dispenser is replaced after the chemicals are released. (Merritt-FIRL)
W74-09725

WASTEWATER TREATMENT USING ELECTROLYSIS WITH ACTIVATED CARBON CATHODE,
General Electric Co., Schenectady, N.Y. (assignee).
M. Kawahata, and K. R. Price.
U.S. Patent 3,788,967. Official Gazette of the United States Patent Office, Vol 918, No 5, p 1968, January 29, 1974.

Descriptors: Waste water, *Electrolytes, *Activated carbon, *Waste water treatment, *Oxidation, Municipal wastes, *Patents.

An improvement in the electrolytic treatment of wastewater is described in which the reduction of oxygen on an activated carbon cathode is employed to form hydrogen peroxide. The peroxide oxidizes the organic carbon pollutants in the wastewater. The oxygen is fed to the activated carbon cathode from outside the electrolytic cell. The cathode is part of the enclosure for feeding the gas to the surface, which forms part of the boundary of the cell compartment. (Merritt-FIRL)
W74-09729

VACUUM SEWAGE CONVEYING WITH VACUUM OPERATED VALVE,
B. C. Burns.
Patent 3,788,338. Official Gazette of the United States Patent Office, Vol 918, No 5, p 1812-1813, January 29, 1974.

Descriptors: Pipes, Engineering structures, *Sewage, *Pipelines, *Sewage disposal, *Patents, Waste water treatment.
Identifiers: *Vacuum sewage conveyance.

A method and apparatus for conveying sewage by vacuum-induced plug flow are described. The sewage is drawn from a sewage-collecting region into a vacuum line pipe through a valve, and moves toward the source of vacuum by vacuum-induced plug flow caused by the interposition of volumes of air between plugs of sewage. A control zone in an operator portion of the vacuum valve is controllable by a low-pressure reservoir for opening the valve. The reservoir is maintained at a low pressure through a vacuum tap conduit communicable with the reservoir and the vacuum line conduit. The sewage-collecting region may be an underground collecting tank which contains equipment for controlling operation of the vacuum valve which may be located outside the collecting region in a separate housing just below grade. Electrical power used at the collecting region may be supplied solely from a central panel through cable laid in a trench along the vacuum line conduit. A rigid pipe assembly in the collecting tank is connected several feet above the tank bottom, but below grade, to a pipe assembly of the vacuum valve, and the orientation may be such as to permit disconnection of pipes at the vacuum valve without causing leakage in the region where workmen must stand. (Merritt-FIRL)
W74-09731

PRIMING UNIT FOR DISTRIBUTING PRIMING WATER TO MULTIPLE SEWER LINE WATER TRAPS,
Precision Plumbing Products, Inc., Portland, Oreg. (Assignee).
J. B. Watts.
U.S. Patent 3,776,269. Official Gazette of the United States Patent Office, Vol 917, No 1, p 144, December 4, 1973.

Descriptors: Conduits, Water transfer, *Sewers, *Conveyance structures, Equipment, *Patents, Waste water treatment.
Identifiers: *Priming water.

A priming unit for distributing priming water to multiple sewer line water traps is described. It consists of a case of compact dimensions and means for coupling the case to a source of priming water. A plurality of water outlet pipes penetrate the case floor by a predetermined distance to permit use of the water contained in the case to measure the level condition of the unit. There is substantially equal distribution of priming water through all the pipes to the various sewer line water traps. (Merritt-FIRL)
W74-09732

SOME LESSONS FROM MODEL AND FULL-SCALE TESTS IN RECTANGULAR SEDIMENTATION TANKS,
Imperial Chemical Industries Ltd., Runcorn (England). Mond Div.
G. A. Price, and M. S. Clements.
Water Pollution Control, Vol 78, No 1, p 102-113, 1974. 8 fig, 11 tab, 7 ref.

Descriptors: *Waste water treatment, *Model studies, *On-site tests, *Settling basins, Sedimentation, Treatment facilities, Efficiencies, Intakes.
Identifiers: Inlet design, Flow-through time, Settling time.

Results of research into the effects of inlet changes, density and wind-induced currents on the performance of rectangular sedimentation tanks are summarized. The investigation included experiments on both models and full-scale tanks at six sewage works to test the importance of time ratio and inlet design on the efficiency of tanks. Time ratio is 00046measure of the streaming throu the tank and defined as the ratio of effective flow-through time to effective settling time with an ideal value of unity. (Sandoski-FIRL)
W74-09736

COAGULATION OF STORMWATERS AND LOW ALKALINITY WASTEWATERS,
Notre Dame Univ., Ind.
L. H. Ketchum, Jr., and W. J. Weber, Jr.
Journal Water Pollution Control Federation, Vol 46, No 1, p 53-62, January, 1974. 17 fig.

Descriptors: Chemical engineering, Water treatment, *Storm water, Hydrogen ion concentration, *Alkalinity, *Waste water treatment, *Lime, *Silica, *Coagulation.
Identifiers: Activated silica, Clarification.

The clarification of low alkalinity wastewaters by the chemical combination of lime and activated silica was investigated. To facilitate control and to study significant variables, synthetic systems were made by adding known quantities of selected substances to water to produce the desired experimental characteristics. Studies of stormwaters and wastewaters were subsequently conducted to confirm the observation made on the synthetic systems. The lime and activated silica were effective. Low alkalinity wastewater can be coagulated with .002 moles/liter of lime or .00075 moles/liter of lime plus 3.75 milligrams/liter of activated silica. Based on these dosages, the cost per million gallons of wastewater treated using lime alone and lime plus activated silica are $11.92 and $8.72, respectively. This chemical cost savings and the decreased sludge to be handled make the use of activated silica economically advantageous for low alkalinity wastewaters. (Merritt-FIRL)
W74-09738

DEVELOPMENTS IN THE TREATMENT OF SEWAGE FROM SMALL COMMUNITIES.
Department of the Environment, (U.K.), Notes on Water Pollution, No 60, p 1-4, March, 1973. 14 ref.

Descriptors: *Sewage treatment, *Treatment plants, *Rural areas, Maintenance, Septic tanks, Percolation, Activated sludge, Aeration, Stabilization, Oxidation lagoons, Biological treatment, Filtration, Effluents, Suspended solids, Filters, Digestion tanks, Sludge disposal, *Waste water treatment.
Identifiers: *United Kingdom.

The treatment of sewage from small communities is discussed and recent developments are described. Many problems of small treatment plants relate directly to the fact that small plants can normally provide little supervision or maintenance and privately owned plants are especially liable to serious neglect. Before 1960, there was essentially only a combination of septic tanks and percolating filters for treating sewage from small communities. During the last decade a variety of modified activated sludge systems has been actively developed particularly for small scale use. Three forms of plant have evolved: extended aeration, contact stabilization, and the oxidation ditch. Purification plants using rotary disc biological contactors have recently been introduced into the United Kingdom. Extended filtration and submerged bed aeration plants have been commercially developed to a small scale as small package plants. The main developments in effluent polishing for small systems have been with the simplest systems: grass plots, upward flow clarifiers; and slow sand filters. The use of separate aerobic digestion plants to stabilize raw or septic tank sludge at central collection works has overcome the problem of sludge disposal. (Merritt-FIRL)

CHEMISTRY OF MODERN WATER CHLORINATION, I, INTRODUCTION, II, THE CHEMISTRY OF CHLORINATION,
Newcastle and Gateshead Water Co., Newcastle-upon-Tyne (England).
A. T. Palin.
Water Services, Vol 78, No 935, p 9-12, January, 1974. 3 fig, 2 tab, 8 ref.

Descriptors: *Chlorination, *Chlorine, *Reviews, *Disinfection, *Water treatment, Waste water treatment.

A review of the present state of chlorine use for the disinfection of water is presented with emphasis on the chemistry of chlorination. The forms of chlorine, which include gas, solutions, solids, and new products, chlorine dissolved in water, breakpoint reactions, and definitions of modern chlorination are discussed. (See also W74-09745) (Sandoski-FIRL)
W74-09744

CHEMISTRY OF MODERN WATER CHLORINATION, III, DISINFECTION BY CHLORINE, IV, CHLORINATION OF WASTE-WATER AND INDUSTRIAL WATERS,
Newcastle and Gateshead Water Co., Newcastle-upon-Tyne (England).
A. T. Palin.
Water Services, Vol 78, No 936, p 53-56, February, 1974.

Descriptors: *Reviews, *Disinfection, *Chlorine, *Water treatment, Hydrogen ion concentration, Temperature, *Waste water treatment, Industrial water, *Chlorination.
Identifiers: Residual chlorine, Contact time.

Disinfection by chlorine is discussed with regard to the effect of the hydrogen ion concentration, the effect of temperature and time of contact, and the nature of residual chlorine and minimum safe levels. Also discussed are the chemistry of waste water chlorination, residual chlorine control, and chlorine requirements. (See also W74-09744) (Sandoski-FIRL)
W74-09745

PROTEIN RECOVERY FROM PROCESS EFFLUENTS USING ION-EXCHANGE RESINS,
Tasman Vaccine Lab. Ltd., Poole (England). Ecotech Systems Div.
R. A. Grant.
Process Biochemistry, Vol 9, No 2, p 11-14, February/March, 1974. 2 fig, 12 tab.

Descriptors: *Ion-exchange, *Resins, *Proteins, *Effluents, Food processing industry, Hydraulic properties, Biochemical oxygen demand, Adsorption, Water treatment, Industrial wastes, Byproducts, Waste water treatment.
Identifiers: *Recovered protein.

A process was developed which permits the separate recovery of protein and fat from meat, poultry and other food processing effluents, while at the same time achieves a large reduction in the BOD level. The process uses a recently developed ion-exchange resin capable of adsorbing proteins and other macromolecules. The resins can be manufactured in the granular form giving excellent hydraulic properties. They can be used in a conventional type plant with the usual facilities for cleaning the bed by backwashing. Both anion and cation exchange forms of the resin are available and combination of these makes it possible to treat water up to a very high standard, that is, BOD values of less than 10 mg/liter have been achieved. (Merritt-FIRL)
W74-09747

TUNNELS MAY STORE STORMWATER FOR LATER TREATMENT.
The American City, Vol 88, No 12, p 75, December, 1973.

Descriptors: *Wisconsin, *Tunnels, *Storm water runoff, Subsurface drainage, *Storm drains, *Underground storage, Combined sewers, Sanitary sewers.
Identifiers: *Milwaukee(Wisc).

A study of a proposal to build 20 miles of tunnels in bedrock under Milwaukee to store overflow from a combined sanitary and storm sewer system was approved by a Southwestern Wisconsin Regional Planning Commission committee. The tunnels would measure about 30 by 40 feet each, would be 250 feet below the surface, and would connect 112 outfalls of three rivers. If the three-year, $2.3 million study is approved by the necessary agencies the Federal government would pay 75 percent of the $175 million cost, the state 12.5 percent, and the sewerage commission 12.5 percent. SOLVENT EXTRACTION IN PROCESSES FOR METAL RECOVERY FROM SCRAP AND WASTE,
Warren Spring Lab., Stevenage (England).
A. W. Fletcher.
Chemistry and Industry, p 414-419, May 5, 1973. 15 fig, 2 tab, 14 ref.

Descriptors: *Industrial wastes, *Recycling, *Solvent extractions, *Metals, Metallurgy, Nickel, Cobalt, Effluents, Sludge treatment, Leaching, Separation techniques, *Waste water treatment.

A significant and growing proportion of metals consumed by industry is being provided by the recycling of scrap and/or waste. These include process wastes, capital wastes, domestic refuse, and effluents. Traditionally, the processes used to recover metal from wastes were pyrometallurgical, but currently there has been growing interest in hydrometallurgical processes, involving dissolution, separation and reduction to metal. In this sequence of operations, solvent extraction is proving to be a versatile method for metal recovery. The equipment requirements are modest, the process is simple to operate on a continuous basis, and its value and versatility has been proved by successful commercial application. Several metal recovery techniques involving solvent extraction are described in detail for the case of refractory Ni-Co alloy scrap which is not amenable to processing by conventional techniques. Flowsheets are presented for the recovery of copper, zinc, and cadmium from base metal and for the recovery of cobalt, nickel, iron, copper, chromium, zinc, and manganese from chemical process wastes. Profitable application of the solvent extraction method to treatment of effluents depends on flow and metal content of the waste. (Jernigan-Vanderbilt)

STATE-OF-THE-ART OF WASTE DISPOSAL IN THE COATINGS INDUSTRY (AS OF JUNE 1973),
R. Tackett.
Journal of Paint Technology, Vol 46, No 590, p 63-68, March, 1974. 8 tab.

Descriptors: *Survey, *Waste disposal, *Coatings, *Reclamation, *Industrial wastes, Pollution abatement, Equipment, Dusts, Liquid wastes, Solid wastes, Gases, Recycling, Landfills, Sludge disposal, Alternate planning.

The results of a survey on waste disposal techniques currently in use in the coatings industry are discussed. The questionnaire which was answered by 558 companies, was divided into four parts: vapors, liquids, dusts, and solids. Questions concerning installation of control equipment and its operation were asked in each section. Equipment was installed by 114 companies for controlling water based liquid wastes. The most popular methods of control were settling tanks, ponds, or basins. The main problem of control methods for all wastes is that they generate a solid waste or sludge which presents a serious disposal problem. The coating industry will have to develop an alternate method to landfill for disposal of solid waste or sludge. Reclamation may be most suitable because of the value of some of the components. Descriptors: *Waste disposal wells, *Injection wells, *Acids, *Chemical wastes, Water pollution effects, Industrial wastes, Path of pollutants, Sandstone, *Illinois, *Indiana.
Identifiers: Pickle liquors(Wastes), *Mt. Simon Sandstone(Ill.-Ind.).

Underground injection of waste pickle-liquor from steel processing was surveyed. Hydrochloric and sulfuric acids are being injected into deep wells completed in the Cambrian age Mt. Simon Sandstone Formation in Illinois and Indiana. The average depth of injection wells is 4,000 feet, and injection is mostly by gravity flow at rates as high as 4,000 barrels per day. The details of the design and operating history of a well located near Gary, Ind., are discussed. Laboratory tests show that the Mt. Simon Sandstone is sensitive to freshwater. The adsorption of iron and neutralization of acids by sandstone was estimated using cores from deep wells and an outcrop. (Knapp-USGS)

RURAL WATER SYSTEM DESIGNED FOR SUBURBAN USE,
Public Works, Vol 104, No 11, p 77, November, 1973.

Descriptors: *Water supply development, Water management(Applied), Rivers, *Ohio, Economics, *Financing, Loans, *Rural areas, Suburban areas, *Water treatment.
Identifiers: Olentangy River(Ohio), Columbus(Ohio).

The organization of the non-profit Del-Co Water Company to build and operate a rural water system designed for suburban use near Columbus, Ohio is described. The company was financed by a membership fee and a loan of $225,000 from the Farmers Home Administration. There are more than 1,500 members in Del-Co, which consists of a basic water plant and 122 miles of distribution lines. An additional 80 miles of distribution piping will complete the project. The source of supply is the Olentangy River, the water of which is hard and contains iron. A processing plant was built using the usual processes of coagulation, sedimentation, and filtration. Initially it will handle 1 1/4 mgd, but can be expanded to 3 mgd. An O-ring joint system connects the vinyl pipes. (Merritt-FIRL)

ULTRAFILTRATION WATER TREATMENT,
Dorr-Oliver Inc., Stamford, Conn.
C. V. Smith, and D. Di Gregorio, Jr.
In: Membrane Science and Technology; Proceedings of Symposium held at the Columbus Laboratories of Battelle Memorial Institute, October 20-21, 1969, Columbus, Ohio: Plenum Press, New York, N.Y., p 209-219, 1970 (second printing 1973). 9 fig, 2 tab.

Descriptors: *Filtration, *Membrane processes, *Water treatment, Pores, Water quality, Water purification, Filters, Membranes, Reverse osmosis.
Identifiers: *Ultrafiltration.

Ultrafiltration is a sieving operation in which membrane pore size is the principal determinant in the separation mechanism. This approach is in contrast to reverse osmosis, in which diffusion is the main mechanism. Ultrafiltration membranes are noncellulosic organic polymers having an asymmetric, extremely thin (5-micron) surface layer or skin and a porous substructure of the same material. The total membrane thickness is only 6 to 8 mils; consequently, to handle the 20 to 50 psi used in water treatment, the membranes are reinforced for added mechanical support. Separations take place at the membrane surface, not within the substructure. (See also W74-09633) (Knapp-USGS)

MERCURY REMOVAL BY CONVENTIONAL WATER-TREATMENT TECHNIQUES,
National Environmental Research Center, Cincinnati, Ohio. Water Supply Research Lab.
G. S. Logsdon, and J. M. Symons.
Journal of the American Water Works Association, Vol 65, No 8, p 554-562, August 1973. 18 fig, 19 ref.

Descriptors: *Mercury, *Water treatment, *Water purification, *Potable water, Laboratory tests, Inorganic compounds, Organic compounds, Testing procedures, Water quality, Coagulation, Filtration, Water softening, Adsorption, Activated carbon, *Ohio River.

Three types of water were used in a study of mercury removal using techniques now employed by many water-treatment plants: raw Ohio River water, treated Ohio River water, and untreated ground water. Mercuric chloride or methyl mercury chloride was added in solution. Coagulation, turbidity removal, carbon adsorption, bentonite adsorption, softening and sand filtration were tested for Hg removal. Removal of mercury by all methods except activated carbon was more efficient when the mercury was in the inorganic form. The relationship between removal of mercury by turbidity removal, coagulation and softening suggests a major role for adsorption of mercury onto suspended matter in the removal of mercury from water. In the case of low turbidity, ferric sulfate was more effective than alum coagulation. Removal by coagulation and softening showed little dependence on mercury concentration in the range 3-16 micrograms/l. Removal by activated carbon adsorption was a function of powdered carbon dose. As long as raw water mercury levels remain low, existing technology should be adequate for removing mercury. (Jernigan-Vanderbilt)

REMOVAL OF ARSENIC (V) FROM WATER BY ADSORPTION ON ALUMINUM AND FERRIC HYDROXIDES,
Illinois Univ., Urbana. Dept. of Civil Engineering.
J. H. Gulledge, and J. T. O'Connor.
Journal of the American Water Works Association, Vol 65, No 8, p 548-552, August 1973. 3 fig, 6 tab, 15 ref.

Descriptors: *Arsenic compounds, *Water pollution, *Water treatment, *Adsorption, Laboratory tests, Coagulation, Toxins, Iron compounds.
Identifiers: *Alum, *Ferric hydroxide.

Arsenic removal from drinking water at water-treatment plants was observed as a function of pH and coagulant dose. The experimental results, expressed as the percentage removal of arsenic (V), showed the arsenic adsorption on ferric hydroxide exceeds the adsorption on aluminum hydroxide. In both cases, increased coagulant dosage resulted in increased arsenic removal. The results also indicated that arsenic removal is somewhat pH dependent. Although there was little difference in arsenic removals at the lower pH reactions, a noticeable decrease in removal was observed at pH 8.0 for both ferric and aluminum coagulants. It appears that the pH became important because of the change in the ionic form of the arsenic (V). Sources and the influence of arsenic as a nutrient and as a poison are discussed. (Jernigan-Vanderbilt)

STUDY OF ARSENIC REMOVAL FROM DRINKING WATER,
Taiwan Inst. of Environmental Sanitation, Taipei. Water Quality Control Section.
Y. S. Shen.
Journal of the American Water Works Association, Vol 65, No 8, p 543-548, August 1973. 1 fig, 21 tab, 7 ref.

Descriptors: *Arsenic compounds, *Water pollution, *Public health, *Water purification, Contaminants, Deep wells, Laboratory tests, On-site tests, Potable water, Heavy metals.

The content of arsenic (0.6-2.0 mg/l) in the drinking water in some parts of Taiwan has been linked to black-foot disease. Lab experiments including plain sedimentation, ion exchange, coagulation, oxidation and coagulation, and filtration tests showed that if arsenic-containing water is oxidized with chlorine, coagulated with ferric chloride, and then filtered, the finished water can be kept free from arsenic for a long period without saturating the filter medium. Field experiments were as follows: (1) raw water was aerated, allowed to settle, and filtered, (2) raw water was aerated, dosed with alum coagulant, allowed to settle, and filtered, (3) same as Exp. 2, but ferric chloride was substituted for alum, (4) same as Exp 3, but chlorine was added during aeration. The fourth field experiment produced an arsenic-free finished water. Based on the results of these experiments, a water plant was built to serve 1500 people. The plan contains an aeration tower, a mixer, a sedimentation tank, two slow sand filters, a storage tank, an elevation tank and a sand washing basin. (Jernigan-Vanderbilt)

REPORT ON GREAT LAKES WATER QUALITY FOR 1972.
International Joint Commission-United States and Canada.
1973. 30 p, 1 map.

Descriptors: *International Joint Commission, *Federal government, *Grear Lakes, *Water quality, Water quality control, Legal aspects, Waste water treatment, Water pollution treatment, Administration, Budgeting, Water resources, Decision making, Eutrophication, Water pollution effects, Social aspects, Phosphorous, Regulation, Project planning, Specifications, Foreign countries, United States, Canada.

The international commission on Great Lakes water quality could not fully discharge their assigned responsibilities under the agreement until each country gave adequate and timely support. Canada has delayed staffing whereas the United States has provided insufficient funding. The Canada-Ontario agreement for municipal waste treatment will meet the Canadian obligation for water quality control. The U.S. will meet its obligations only if larger monetary allotments are made. The commission recommends that each government accelerate the enforcement of industrial waste treatment programs and concludes that the limitations on phosphorous in detergents and programs for phosphorous elimination at treatment plants have already resulted in the reduction of phosphorous loadings to the lower lakes. This is noteworthy because of the key role phosphorous plays in causing eutrophication. The commission urges that responsible officials in both countries formulate programs to ensure the provision of adequate receiving, pump-out, facilities for pleasure and commercial vessels. Though further degradation of water quality may have been slowed, there is no scientific basis to judge the extent of the improvement except in localized areas. (Sperling-Florida)

CLEAN WATER--A CHALLENGE TO THE NATION, HIGHLIGHTS AND RECOMMENDATIONS OF THE NATIONAL CONFERENCE ON WATER POLLUTION.
Public Health Service, Washington, D.C.
Public Health Service Publication No 816 (December 1960). 48 p, 16 photo.

Descriptors: *Water pollution, *Water pollution control, *Water quality, *Water quality control, *Conferences, Water pollution treatment, Water pollution effects, Water pollution sources, Water resources, Regulation, Water resources development, Governments.

In 1960, President Eisenhower called together the National Conference on Water Pollution to discuss and evaluate the problems facing the nation in the area of water pollution and to make recommendations on how to meet those problems. Highlights of the Conference are presented. Four panel groups were established to study four basic areas of concern in the field of water pollution. These areas were: the effect of pollution on the Nation's health, welfare and economy; the importance of water pollution control on the management of water resources; the responsibilities of government, industry, agriculture and the public in combating pollution; and the need for research and professional training. Excerpts from the reports of each panel are presented along with the remarks of various persons who addressed the Conference. The recommendations of the Conference are outlined. (Flowers-Florida)

UTAH ENVIRONMENTAL PROBLEMS AND LEGISLATIVE RESPONSE: PART 1,
Environmental Protection Agency, Denver, Colo. Region VIII.
J. W. Raisch.
Utah Law Review, Winter 1972, p 479-490. 90 ref.

Descriptors: *Utah, *Rivers, *Lakes, *Water quality control, *Waste water treatment, Waste water disposal, Environmental sanitation, Aesthetics, Social aspects, Farm wastes, Return flow, Water pollution sources, Water conservation, Water sources, Water supply, Municipal wastes, Industrial wastes, Turbidity, Water pollution effects, Water quality, Recreation, Waste water(Pollution), Population.
Identifiers: Hazardous substances(Pollution).

The most significant environmental problem facing Utah is derived from population growth and urbanization. Utah's major water quality problems are pollution of several rivers and lakes, including the Great Salt Lake, each basically caused by expanding population and industry. Most usable water originates in the mountains and as it flows it becomes subject to degradation by agricultural and recreational activities. Twenty-two waste treatment plants discharge domestic waste water from 650,000 persons. The most salient problems are caused by organic materials being discharged by overloaded and poorly operated municipal waste water treatment plants. Oil, farm wastes, and a low flow are compounding the problem. Utah Lake suffers from turbidity which is attributable to shallowness and domestic and industrial discharges. Agricultural return flow is a contributing factor. Nine waste water treatment plants and three industrial plants are also discharging into the lake. One-hundred and fifty square miles of the lake do not meet 1978 water quality standards. (Sperling-Florida)

PROTECTING AMERICA'S ESTUARIES: FLORIDA (PART 2).
Hearings---Subcomm of the Comm on Government Operations, U.S. House of Representatives, 93d Cong, 1st Sess, May 26, 1973. 672 p.

Descriptors: *Water resources development, *Environmental effects, *Estuaries, *Ecology, *Pollution abatement, *Florida, Economics, Saline water-freshwater interfaces, Estuarine environment, Environmental engineering, Water quality, Water pollution, Water pollution effects, Legislation, Water demand.
Identifiers: *Congressional hearings.

The first portion of the hearings consisted of testimony from witnesses from Federal, State and local levels of government and the second was comprised of witnesses from private organizations, such as the Audubon Society, Sierra Club, and the Environmental Policy Center. Statements and testimony from various business men and concerned individuals, who feel the environment should be of primary concern, are included. Displeasure was expressed over federal legislation, and also over big business' attitude, concerning environment and ecology. Along with testimony, about 20 statements, and several letters were submitted for the record. Literature concerned with the prevention of oil spills from federally leased facilities in the Gulf and other Outer Continental Shelf areas is presented as is material submitted for the record by the private organizations in their testimony. SANITATION AND PUBLIC HEALTH PLANNING,
Escola Nacional de Saude Publica e de Medicina Tropical, Lisbon (Portugal).
H. X. A. Pedrosa.
An Esc Nac Saude Publica Med Trop. Vol 5, No 1/2, p 149-153. 1971.
Identifiers: Human population, *Planning, *Portugal, *Public health, *Sanitation, Sewer systems, Regulation, Waste disposal, Water quality standards.

In planning public health services in Portugal, the central government can subsidize and guide the local health departments. The district of state governments should determine the major outlines of sanitary policy, set up regulations and supervise the local agencies or health centers, which in the long run determine the effectiveness of the program. To handle the expanding need for public health services and new policies, the formation of a public health service company, by government and private sources, is suggested. It would be responsible for planning, building and operating water and sewer services in cooperation with local governments, and promoting research and technical, economic, sanitary and financial studies. The provision of water and sewer disposal are the most urgently needed services, since 78% of the population lives in rural areas and small communities which cannot afford the cost of building or operating such services. Of the total population of the country, 70% do not have piped water, 78% do not have public sewer systems, 22% do not have a bathrooms and 56% do not have toilets.--Copyright 1974, Biological Abstracts, Inc.

TEST AND EVALUATION OF OIL POLLUTION ABATEMENT DEVICES FOR SHIPBOARD USE, PHASE 3,
Coast Guard, Washington, D.C. Naval Engineering Div.
L. B. Norton.
Available from NTIS, Springfield, Va 22151 AD-762 488 Price $3.00 printed copy; $1.45 microfiche. Phase 3 Final Report, January 1973. 16 p, 1 fig.

Descriptors: *Oily water, *Separation techniques, *Emulsions, *Oil pollution, Water pollution control, Water treatment, Waste water treatment, Filtration.

A separator system for oily water was tested for both bilge and ballast service on a 210 ft U.S. Coast Guard cutter. The capacity of the filter-coalescer system was 100 gpm. The effluent was monitored by an on-line infrared absorption type monitor. The alarm points were set to recirculate water effluents exceeding 20 mg per liter. Bilge mixtures were processed both at sea and in port. Normal water effluent oil concentrations were 12 to 20 mg per liter. Ballast mixtures were processed in port. A maximum of 5 mg per liter was discharged overboard during this procedure. Most emulsions were separated satisfactorily. The separated oil product from both bilge and ballast emulsions was used in the ship's main propulsion diesel engines and auxiliary boilers. (Knapp-USGS)
W74-09321

VACUUM DESORPTION CONCEPT FOR REMOVING OIL FROM WATER,
Mechanics Research, Inc., Los Angeles, Calif.
G. M. Pomonik.
Available from NTIS, Springfield, Va 22151 as AD-764 447, Price $4.25 printed copy; $1.45 microfiche. Final Report, to Coast Guard Office of Research and Development, March 1973. 107 p, 32 fig, 11 tab.

Descriptors: *Separation techniques, *Oily water, Water pollution control, Oil spills, Oil pollution, Bubbles, Flotation, Froth flotation, Gases, *Pollution abatement.
Identifiers: *Vacuum desorption.

A prototype working model was developed of a separator for the removal of oil from bilge and ballast water aboard ships and tanks. The concept involves desorption of gas from the water by means of a vacuum. The bubbles thus formed aid the separation process by forming on particles in the water and rapidly raising them to the surface. Tests include design, development and fabrication of a prototype unit to study the capabilities of the system with a variety of oil types and input conditions. The results were projected to a full scale shipboard installation. (Knapp-USGS)
W74-09323

UNDERGROUND INJECTION OF WASTEWATERS IN THE OHIO VALLEY REGION.
Ohio River Valley Sanitation Commission, Cincinnati. Committee on Subsurface Industrial Wastewater Injection,
Available from ORSANCO, 414 Walnut St, Cincinnati, Ohio 45202, Price $3.00 per copy. Ohio River Valley Water Sanitation Commission (ORSANCO) Report, August 1973. 63 p, 14 fig, 6 tab, 21 ref.

Descriptors: *Waste water disposal, *Injection wells, *Waste disposal wells, Ohio River, Indiana, Ohio, New York, Pennsylvania, West Virginia, Kentucky, Illinois, Hydrogeology, Regulation, Interstate commissions.
Identifiers: *Ohio River Valley.

Recommended administrative procedures for regulation of wastewater injection wells in the Ohio Valley are outlined. The geological and technological aspects to be considered in preparing and evaluating proposals, and for guiding the construction, operation and abandonment of injection systems are discussed. Areas where subsurface waste injection is indicated as being of only limited feasibility are those where no aquifers containing more than 1,000 mg/liter of dissolved solids are available; the saline-water-bearing sedimentary sequence is less than 1,500 ft thick; and structural geologic conditions are considered sufficiently complex to cause great uncertainty about subsurface hydrology. A foremost consideration in evaluating the feasibility of deep-well injection is the character of the untreated wastewater. Waste volumes should be small. Quantities greater than a few hundred gallons per minute are generally too great for injection into a single well in the Ohio Valley. (Knapp-USGS)
W74-09324

WASTE MANAGEMENT: GENERATION AND DISPOSAL OF SOLID, LIQUID AND GASEOUS WASTES IN THE NEW YORK REGION,
Regional Plan Association, N.Y.
B. T. Bower, G. P. Larson, A. Michaels, and W. M. Phillips.
A report of the Second Regional Plan, New York. March 1968. 107 p, 20 fig, 19 tab, photos, append.

Descriptors: *Waste disposal, *Alternate planning, Institutional constraints, Political aspects, Waste identification, Wastes, Waste treatment, Regulation, *Liquid wastes, *Solid wastes, *Gases, New York.
Identifiers: *Waste management, *New York City.

While specifically focusing on waste management in the 31-county New York Metropolitan Region, this report delineates a process for developing waste management policies applicable to any metropolitan area. The process has 4 steps: (1) projections of total population and employment for the Region to the year 2000; (2) selection of different distributions of total population, jobs, and other activities to show the impact of alternate settlement patterns; (3) selection of various 'generation conditions' to analyze the effects of factors contributing to waste production which yield assumed quantities of waste that will be generated; (4) choice of 'management conditions' to show the impact of different techniques and policies for handling and disposing of the generated wastes. Given this analytical framework, the costs and benefits of alternative policy proposals can be evaluated. It is concluded that, given comprehensive analysis of the entire waste management system (beginning with waste generation) and policy control over the entire region, projected waste quantities are manageable and do not seem so economically burdensome as to require efforts to limit population growth. Implications for governmental organization of waste management are also explored. (Hoffman-North Carolina)

BIOLOGY, DISTRIBUTION, IMPORTANCE AND CONTROL OF DEER FLIES AND HORSE FLIES (DIPTERA:TABANIDE) IN WATER-ORIENTED RECREATIONAL AREAS,
Clemson Univ., S.C. Dept. of Entomology and Economic Zoology.
T. R. Adkins, Jr.
Available from the National Technical Information Service as PB-233 435, $5.50 in paper copy, $1.45 in microfiche. Report No. 42, South Carolina Water Resources Research Institute, Clemson, April 1974. 172 p, 40 tab, 88 fig, 18 ref. OWRR A-020-SC(14).

Descriptors: *South Carolina, *Insect control, Insect behavior, Recreation, *Insects, Control, Carbon dioxide, Distribution, *Diptera.
Identifiers: Tabanids, *Tabanidae, *Horse Fly, *Deer Fly, Biting flies, Insect Traps, Chrysops, Tabanus, Ultra-lot-volume.

A survey of biting flies affecting water-oriented recreation in South Carolina revealed that at least 114 species and subspecies of tabanids are present. A plastic canopy trap was devised for monitoring tabanid activity; these traps show promise as control agents in small areas (i.e., around swimming pools). Temporary control of tabanids was obtained with malathion applied either by airplane or by ULV ground equipment. Short-term control was obtained because of fly-in or emergence of new flies. Carbon dioxide was a very efficient attractant for tabanids. Several types of plastic and wood traps were tested for their ability to capture tabanids. The plastic canopy trap with a black decoy sphere captured more of a greater variety of tabanid species than the other traps.

HELICOPTER TOW TESTS OF THE U.S. COAST GUARD'S AIR DELIVERY CONTAINER FOR OIL SPILL CONTAINMENT BARRIER,
Naval Coastal Systems Lab, Panama City, Fla.
J. R. Kennedy.
Available from NTIS, Springfield, Va. 22151, as AD-774 898, Price $3.00 printed copy; $1.45 microfiche. Informal Report NCSL 198-73, December 1973. 18 p, 5 fig, 2 append. MIPR: Z-70099-4-41543.

Descriptors: Oil spills, *Oily water, Water pollution control, *Oil pollution, Aircraft, *Separation techniques, *Pollution abatement.
Identifiers: *Oil spill barriers, Helicopters.

An oil spill barrier with its air delivery packing container was successfully towed by a Navy H-53 tow-equipped helicopter. Flight tow tests were conducted to demonstrate feasibility, develop any required special equipment, and provide data for similar Coast Guard tests. (Knapp-USGS)

AN OBJECTIVE WATER QUALITY INDEX,
Robert S. Kerr Environmental Research Lab., Ada, Okla.
R. D. Harkins.
Journal Water Pollution Control Federation, Vol 46, No 3, p 588-591, March 1974. 1 tab, 2 ref.

Descriptors: *Statistical methods, *Water quality standards, Data processing, Mathematical studies, Water analysis, Analysis, Probability, Water pollution.
Identifiers: *Water quality index.

An objective statistical procedure for combining several water quality parameters to arrive at a water quality index is described. These indexes are directly comparable and may be plotted to show time trends or station differences or analyzed statistically to obtain probability levels. The index is suitable for summarizing water quality and determining overall trends, but it does not replace careful analysis of individual parameters to determine potential sources of pollution problems. (Witt-IPC)

FULL-SCALE HARVEST OF AQUATIC PLANTS: NUTRIENT REMOVAL FROM A EUTROPHIC LAKE,
North Dakota Univ., Grand Forks. Dept. of Biology.
S. A. Peterson, W. L. Smith, and K. W. Malueg.
Journal Water Pollution Control Federation, Vol 46, No 4, p 697-707, April 1974. 5 fig, 6 tab, 27 ref.

Descriptors: Aquatic plants, *Aquatic weed control, *Municipal wastes, Water pollution effects, *Phosphorus, *Nutrient removal, Lakes, Harvesting, Water quality control, *Eutrophication, Water chemistry, Water quality, Water pollution, *Minnesota, Water pollution sources, Waste water(Pollution).
Identifiers: *Lake Sallie(Minn), Detroit Lakes(Minn).

A study was made of the nutrient input and content of Lake Sallie, Minnesota. The prime nutrient source to the lake was pinpointed as the waste water outfall from the city of Detroit Lakes, Minn. After determining the nutrient balance for the lake, aquatic plants were harvested for 3 months from the entire littoral zone of the lake. A reevaluation of the nutrient balance of the lake was made to determine the effects of aquatic plant harvesting. The study showed that a full-scale harvesting program was not sufficient to offset the high phosphorus loading in the lake. The harvesting program was able to remove only 1.37% of the total phosphorus input to the lake. (Witt-IPC)

AQUATIC MIDGE LARVICIDES, THEIR EFFICACY AND RESIDUES IN WATER, SOIL, AND FISH IN A WARM-WATER LAKE,
California Univ., Riverside. Dept. of Entomology.
M. S. Mulla, R. L. Norland, W. E. Westlake, B. Dell, and J. St. Amant.
Environ Entomol, Vol 2, No 1, p 58-65, 1973, Illus.
Identifiers: *Aquatic insects, Carbaryl, Chironomus, Chlorpyrifos, Cricotopus, Dicrotendipes, Fenitrothion, Fish, Lakes, *Larvicides(Midges), *Midges, Soils, Tanypus, *California.

To study the efficacy of chemical larvicides, several materials were evaluated in 2 warm-water southern California artificial lakes, (lake Calabasas and Westlake), and the residues of an effective larvicide (chlorpyrifos) in various components of 1 of the lakes were investigated. Abate (O,O'-(thiodi-p-phenylene) O,O,O', O'-tetramethyl phosphorothioate) gave excellent control of Chironomine midges, but only poor control of the smaller Tanypodine midges. Carbaryl yielded poor control of both groups, and fenitrothion yielded good control of both groups at a higher rate of application. Chlorpyrifos at 0.2 lb active ingredients per acre-surface yielded complete control of Chironomine midges for 12 wk or longer, but suppressed the Tanypodine larvae for only 7-8 wk. Residues of chlorpyrifos were generally higher in the bottom water, even though maximum residues in both layers reached 0.6 ppb. Residues were much higher in the mud, reaching a mean maximum of 0.3 ppm in the top 1-inch section of mud samples, but only traces were found in the remaining mud. Maximum residues in water were obtained one day after treatment, declining to below 0.1 ppb within 4 wk after treatment. The maximum residues in the mud were obtained 1 wk after treatment, declining to below 0.1 ppm in 28 days. Slightly higher levels of residues were found in water and mud when the whole lake was treated. Bottom-dwelling and -frequenting fish, such as channel catfish and, to some extent, black crappie contained much higher quantities of chlorpyrifos than the nonbottom dwelling fish such as largemouth bass and bluefill. Mean maximum residues in channel catfish and black crappie were 0.8 and 0.5 ppm after 3 and 2 wk posttreatment, respectively, declining to barely detectable levels 25 days after treatment. The residues in largemouth bass and bluegill were minimal, with maximum approaching 0.2 ppm but remaining 0.1 or below this level most of the time.--Copyright 1973, Biological Abstracts, Inc.

CLEANING UP: PAPER INDUSTRY'S MESS,
J. Josephson.
Environmental Science and Technology, Vol 8, No 1, p 22-24, Jan, 1974. 1 fig, 2 tab.

Descriptors: *Pollution abatement, *Pulp and paper industry, *Pulp wastes, *Water pollution control, *Air pollution, *Water quality standards, *Legal aspects, *Regulation, *United States, *Legislation, Water quality act, Federal Water Pollution Control Act, Effluents, Costs, Capital costs, Operating costs, Waste water treatment, Water quality control, Industrial wastes, Waste water(Pollution), Water pollution sources.

The major water pollutions discharged by the U.S. pulp and paper industry are listed and their origins are indicated. While the EPA is preparing new effluent guidelines for aqueous emission control, regulations set forth in the 1972 Amendments to the Federal Water Pollution Control Act require all existing mills to use the best practicable control technology available by July 1977 and the best available technology economically achievable by July 1983, with a zero-discharge goal set for 1985. Air emission standards about to be formulated will probably resemble those already prepared for Europe's paper industries. Methods of reducing water and air pollution loads issuing from pulp and paper mills are summarized, and the marketing of by-products to help recovery part of the effluent-treatment costs is discussed. Interim standards for limiting water pollutants are presented, and water pollution abatement expenditures for various kinds of mills through 1980 are estimated. (Buchanan-IPC)

REVENTING LANDFILL LEACHATE CON-AMINATION OF WATER,
ulf South Research Inst., Baton Rouge, La.
J. Wren.
vailable from the National Technical Informa-on Service as PB-222 468, $4.25 in paper copy, .45 in microfiche. Environmental Protection gency, Cincinnati, Ohio, Report EPA-670/2-73-1, July 1973. 113 p, 37 fig, 10 tab.

escriptors: Pollution, Industrial wastes, *Tests, Vaste disposal, Water pollution, Surveys, anitary engineering, Sealers, Soil properties, mpling, Contamination.
entifiers: Solid waste disposal, Resource covery, Commercial materials, *Sanitary landfill alants, Synthesized garbage-simulating, eachate, Test pits, *Municipal refuse.

vailable commercial materials and industrial aste products that could possibly be used as sani-ry landfill sealants were tested in elemental test lumns (with the use of synthesized garbage) that mulated field conditions. These materials were en applied to small field test pits filled with mu-cipal garbage. The test pits were equipped with mpling wells, within and around each pit, to onitor any leachate which escaped from the lls. The analytical parameters (BOD, COD, and hers) were compared with baseline data obtained om local area wells to determine the degree of ef-ctiveness of the test materials. (Martino-WWA)

NIVERSITY STUDENTS IMPLEMENT UBLIC POLICY RURAL COMMUNITY AC-ON WITH A WATER DEVELOPMENT PRO-CT,
se Western Reserve Unit., Cleveland, Ohio. rban and Environmental Studies.
G. Montgomery.
ater Resources Bulletin, Vol 9, No 6, p 1258-65, 1973. 3 ref. HUD P-299-9217 (CWRU).

escriptors: *Rural areas, *Financing, *Water pply, Sewage treatment, Government finance, cal governments, Federal government, State vernments, *Ohio.
entifiers: *Rock Creek(Ohio).

r more than ten years the small rural village of ck Creek, Ohio has sought state and federal ancial assistance to improve its water and wage facilities. The existing water system is thout filters and is not metered. The activities of e village and of eight student members of the Urban and Environmental Studies Program at Case Western Reserve University in a ten-week seminar in their search for financial assistance are described. The impact of the village's small size, the characteristics of its population, its choice to remain incorporated, its isolation from major transportation routes, its inability to raise funding shares as required by governmental programs and its present indebtedness on its ability to qualify for state and federal programs are examined. Recommendations for future financial assistance are presented. It was also recommended that greater communication between the state governmental agencies and local communities be fostered, a government information clearing house be established, increased research into alternative governmental solutions to rural problems and an ombudsman be established to aid communication. CAPITAL BUDGETING FOR POLLUTION CONTROL,
A. D. Mikhail.
Journal of General Management, Vol 1, No 1, p 32-44, 1973. 15 tab, 7 ref.

Descriptors: *Budgeting, *Pollution abatement, *Industrial wastes, *Cost-benefit analysis, Capital costs, Monetary benefits, Investment, Industries, Oil industry, Pulp and paper industry, Electric power industry, Steel, Economic justification.
Identifiers: Accounting procedures, Capital expenditures.

Capital budgeting practices to achieve pollution control are examined for the electric utility, steel, integrated domestic oil, and paper and pulp industries. The industrial sample was selected from firms listed in Fortune's Directory of the 500 largest corporations and in Standard and Poor's 'Industrial Survey' with questionnaires submitted to the selected firms' chief financial officers. Of 146 questionnaires sent 27, 8, 11, and 13 responses, respectively, were returned. The distribution of industry respondents are categorized by the 1970-72 relative size of pollution control expenditures, relative size of capital expenditures and reported length of the pollution control project's useful life. Results from the survey indicate that some industries can identify and measure a number of pollution abatement benefits including higher production yields and additional saleable byproducts. For the electrical industry, reduced litigation costs were also cited. Respondents, excluding steel, indicated that abatement benefits tended to be long run in nature. Less certain benefits--improved corporate image and workers' morale--were also noted. While a majority of respondents concluded that traditional cost-benefit analysis is inadequate in selecting abatement procedures, a resonable number utilized the cost-benefit analysis in varying degrees while still placing major emphasis on executive judgement. EFFLUENT CHARGES: A CRITIQUE,
Pennsylvania Univ., Philadelphia. Wharton School.
S. Rose-Ackerman.
Canadian Journal of Economics, Vol 6, No 4, p 512-528, 1973. 5 fig, 20 ref.

Descriptors: *Pollution taxes(Charges), *Effluents, *Decision making, Water pollution control, Regulation, Marginal costs, Marginal benefits, Cost allocation, Waste treatment, Progressive taxes, Regressive taxes, Payment.

The many arguments favoring the imposition of effluent charges to control pollution often are the result of reliance upon models that do not consider the complexity of the real world problems faced by decision makers. When such complexities are operationalized into the earlier models it can often be shown that comparable non-market regulations may be at least as efficient as effluent charges. Among the real world complexities evaluated are cost of information, intensity of pollution investment, collusive behavior among dischargers, discontinuities in marginal cost and benefit schedules, the existence of differing marginal damage functions among pollutors, and cases when joint treatment by dischargers may result in an efficient outcome. Under effluent charges it is shown that some dischargers may be forced out of business, even though their operation may be justified when comparing marginal social costs and benefits, joint treatment facilities may be located in the 'wrong' place, and long term adjustment periods may lead to continued over or under treatment. While it is conceded that non-market schemes often face more difficult problems, it is equally important to realize that effluent charges do not represent a panacea. (Schroeder-Wisconsin)

CONTROLLING POLLUTION BY PRICE AND STANDARD SYSTEMS: A GENERAL EQUILIBRIUM ANALYSIS,
Williams Coll., Williamstown, Mass.
T. H. Tietenberg.
Swedish Journal of Economics, p 193-203, 1973. 12 ref.

Descriptors: *Pollution abatement, *Equilibrium, *Standards, Prices, Economic efficiency, Welfare(Economics), Pollution taxes(Charges), Control, Resource allocation.

The high information requirements to establish an optimal level of pollution has prompted several economists to accept the setting of pollution levels through the political process. Once the level has been decided the pricing system could be used to allocate the accepted pollution levels among polluters. The case for using the pricing system, either through an auction of pollution rights or through a specific tax depends upon an assumption that a single per unit tax on each type of waste discharge will provide a least-cost solution. The validity of this assumption is tested through a simple mathematical model. The analysis concludes that the theoretical case for a price and standard system rests upon the low transaction costs associated with a uniform tax structure. A uniform tax, however, minimizes the costs of attaining a given standard only when the marginal physical product of a particular pollutant is the same for all emitters, a most unlikely situation. If the area can be broken into zones, this assumption may be justified. The optimal number of zones will be obtained when the marginal transaction costs of administering one more zone equals the marginal gains in resource cost reduction. (Schroeder-Wisconsin)

POLLUTION CONTROL: NEW METHOD OF FINANCING,
Rothschild (L.F.) and Co., N.Y.
R. H. Aldrich, and N. A. Eisner.
Financial Executive, Vol 41, No 10, p 118, 120-121, 1973.

Descriptors: *Pollution abatement, *Financing, *Industries, Bond issues, Capital supply, Taxes.
Identifiers: Pollution control revenue bonds.

An important element in the development of any industrial pollution abatement program is the consideration of financing formats. A full consideration of alternative formats can lead up to a 30% reduction in cost. The newest and most promising financial alternative available is the pollution control revenue bond which in the past 12 months has raised $1 billion of abatement funds. These bonds are successors to the industrial development bond which had aided communities in encouraging industrial development by issuing low-cost tax-exempt revenue bonds. The pollution control bond

has improved local environments, provided low-cost capital, and minimized the economic impact of increased pollution standards on communities. Positive impact on the cost of money, cash flow, internal earning objectives, and availability of funds are indicated. Legislation which allows this form of financing has been or is expected to be enacted in 48 states. The Internal Revenue Service regulation may limit the effectiveness of this financing alternative as presently it limits the bonds' revenue to financing of abatement facilities, collection, storage, reclamation, or disposal of solid wastes. The eligibility requisites for these bonds are outlined. (Schroeder-Wisconsin)

THE COASTAL INTERCEPTOR WATERWAY,
Miami Univ., Fla.
D. C. Tabb, and E. J. Heald.
Sea Grant Coastal Zone Management Bulletin No 4, January 1973. 10 p, 3 fig, 5 ref. NOAA Sea Grant No 2-35147.

Descriptors: *Water pollution control, *Canals, Florida, Wetlands, Salt marshes, Coasts, Lagoons, Planning, Land use, Urbanization.

To control pollution of coastal wetlands, wide shallow waterways are proposed to intercept nutrients. The interceptor waterway would be unlike traditional coastal development canals. They should be approximately parallel to coastal contours instead of directly into coastal bays. They are designed to intercept and digest upland nutrients irrespective of tide using sunlight, photosynthesis by plants and wind action to eliminate severe eutrophication, stratification, and oxygen depletion. Tidal exchange should not be considered an important facet of the system. The waterways should have a relatively large surface-to-depth ratio, averaging 5 ft or less in depth. Its seaward shore should be completely natural with a few easily hidden structural safeguards built to preserve uniform height of the seaward edge or sill. The waterways should serve best in coastal areas having very low relief and should function equally well in salt-tolerant grass marshes of the south Atlantic and Gulf states or mangrove marshes of Florida.
